Peñasquitos watershed (HAs 906.1–906.5) encompasses a land area of 94 square miles, making it the second-smallest WMA in San Diego County. It lies in the central portion of San Diego County and neighbors the San Dieguito River Watershed to the north and the Mission Bay/La Jolla and San Diego River WMAs to the south. Approximately 46% of the watershed remains undeveloped or has otherwise been dedicated to open space and recreational lands. The remaining 54% of the land area is being used for residential areas (27%), roadways and transportation (12%), and other uses (15%). The remaining "other" 15% includes industrial, office, commercial, and agricultural land uses. Within the Los Peñasquitos watershed, pollutants are sourced primarily from urban runoff, sewage spills, dredging, and landfill leachate (PCW n.d.-e).

San Diego watershed (HAs 907.1–907.4) is the second largest hydrologic unit in the San Diego region (approximately 434 square miles) and hosts the highest population (approximately 520,000 residents) of the region's watersheds. Approximately 44% of the watershed is undeveloped, mainly in the upper, eastern portion.

The remaining 56% is urbanized with open space and park land (23%); residential (19%); transportation (6%); and commercial, agricultural, industrial, military, and miscellaneous land uses (2%) land uses predominating (PCW n.d.-f). Sources of pollutants within the San Diego River Watershed include urban and agricultural runoff, mining operations, and sewage spills (PCW n.d.-f).

San Diego watershed (HAs 907.1–907.4) is located entirely within the boundaries of San Diego County and includes three major subwatersheds: Pueblo San Diego, Sweetwater, and Otay. The San Diego Bay watershed supplies many local residents with potable water sourced from one of four reservoirs: the Sweetwater, Loveland, and Upper and Lower Otay reservoirs. Sources of pollutants impacting the above beneficial uses include urban and agricultural runoff, resource extraction, septic systems, and marinas and boating activities (PCW n.d.-g).

Pueblo San Diego watershed (HAs 908.1–908.3) is the smallest hydrologic unit in the San Diego region (approximately 60 square miles) and the most densely populated (approximately 500,000 residents). It drains to San Diego Bay. This watershed is approximately 75% developed with urban uses, but the dominant land use remains relatively consistent between HAs. Residential areas are the primary land use in all three of its hydrologic areas, comprising 32%, 40%, and 46% of the total land area of the Point Loma (908.1), San Diego Mesa (908.2), and National City (908.3) HAs, respectively (PCW n.d.-g). The creeks in the watershed are impaired by urban runoff, and Chollas Creek and the mouth of the creek in San Diego Bay are impaired for various trace metal parameters and aquatic toxicity (PCW n.d.-g). Five locations of San Diego Bay, which receives runoff from the Pueblo San Diego watershed, are identified as toxic hot spots by California's Bay Protection Toxic Cleanup Program (PCW n.d.-g). Toxic hot spots are identified as areas where pollutants have accumulated in the water or sediment to levels that may pose a hazard to aquatic life, wildlife, fisheries, or human health; may impact beneficial uses; or may exceed water quality or sediment quality objectives adopted by the State Water Resource Control Board (SWRCB) or regional water quality control board (RWQCB).

Sweetwater watershed (HAs 909.1–909.3) drains approximately 230 square miles. It is one of three watersheds that drain to San Diego Bay (along with Otay and Pueblo San Diego). Approximately 86% of the watershed is within unincorporated County of San Diego jurisdiction. Over half of the watershed is undeveloped and open space lands (60%). The Lower Sweetwater is the most urbanized, with residential areas leading at 44%, followed by transportation uses at 18% of land area. Undeveloped and open space lands dominate the majority of the area within the Middle and Upper Sweetwater HAs, making up 63% and 82%, respectively. Residential land uses follow in each of the hydrologic areas, with 28% and 12% of the total in each of the Middle and Upper Sweetwater HAs. The upper portion of the watershed contains large undeveloped areas within the Cleveland National Forest and Cuyamaca Rancho State Park; the unincorporated communities of Pine Valley, Descanso, and Alpine; and the Viejas Indian Reservation. The central part of the watershed consists of unincorporated rural and suburban communities, whereas the urbanized lower part contains portions of several cities, including San Diego, National City, Chula Vista, La Mesa, and Lemon Grove. Water quality impairments in the watershed are coliform bacteria, Enterococcus bacteria, trace metals, and other toxics (PCW n.d.-h).

Tijuana watershed (HAs 911.1–911.8) is the southernmost in the San Diego region with a drainage area of approximately 1,750 square miles (27% on the US side of the international border and 73% on the Mexico side). Within the US-controlled Tijuana watershed, most of the land remains undeveloped at 86% of the land area, followed by residential land uses at 7%, agricultural land uses at 3%, and transportation uses at 2%. The Tijuana Estuary, a National Estuarine Sanctuary that supports a variety of threatened and endangered plants and animals, is threatened by inflows from the Tijuana River containing high concentrations of coliform bacteria; sediment; trace metals (copper, lead, zinc, chromium, nickel, and cadmium); polychlorinated biphenyls (PCBs); and other urban, agricultural, and industrial pollutants. Sources of these pollutants include urban runoff, sewage spills, industrial discharges, agriculture, orchards, livestock, domestic animals, and septic systems (PCW n.d.-i).

Colorado River Hydrologic Basin

The Colorado River Hydrologic Basin has small portions of five HUs located within the eastern San Diego region. These units include the Anza-Borrego watershed, which is the largest hydrologic unit, covering about 80% of the desert portion of San Diego County and extending into Imperial and Riverside Counties. Portions of the Clark,

Whitewater, and West Salton watersheds are located at the extreme northeast corner of the San Diego region. The Imperial watershed is located at the southeast edge of the San Diego region and extends into Imperial County. Water is limited in all of these areas. The surface water that intermittently exists flows toward the Salton Sea and the Colorado River. Runoff occurs from winter precipitation especially in the higher elevations and from summer thunderstorms. The majority of the land uses within the San Diego region portion of the Colorado River Hydrologic Basin are parkland, undeveloped land, and agriculture. The remaining portions are sparsely populated with single-family residential units and a small amount of other uses (County of San Diego 2011a).

The Colorado River Basin RWQCB divides the Colorado River Hydrologic Basin into seven major planning areas based on economic and hydrologic characteristics. Only three of these planning areas lie within the San Diego region: Coachella Valley, Anza-Borrego, and Imperial Valley. The other four that fall outside of the San Diego region are Lucerne Valley, Hayfield, Salton Sea, and the East Colorado River Basin. Characteristics of each of the three Colorado River Hydrologic Basin planning areas in the San Diego region are described below:

Anza-Borrego Planning Area includes the Clark, West Salton Sea, and Anza-Borrego HUs. It comprises 1,000 square miles, mostly within the San Diego region and Imperial County, with a small segment in Riverside County. Elevations range from 230 feet below sea level at the Salton Sea to over 6,000 feet along the western boundary. The principal communities in the planning area are Salton City and Borrego Springs. Drainage flows to the Salton Sea except for two small areas of internal drainage in Clark and Borrego Valleys in the northwest corner of the planning area. Average annual precipitation ranges from less than 3 inches along the eastern boundary, near Imperial Valley, to 25 inches in the mountain divide between the Salton Sea and Pacific Ocean drainages. Runoff occurs from winter precipitation especially in the higher elevations and from summer thunderstorms. Perennial flow includes reaches of Coyote Creek and San Felipe Creek (CRB RWQCB 2024).

Coachella Valley Planning Area contains the Whitewater HU and the East Salton Sea HU. It lies almost entirely in Riverside County and covers 1,920 square miles in the west-central portion of the Colorado River Hydrologic Basin. Only a small area in the southernmost portion lies within the San Diego region. Elevations range from over 10,000 feet in the San Jacinto Mountains to 230 feet below sea level at the Salton Sea shoreline. The higher elevations of the San Bernardino and San Jacinto mountains have evergreen forests with perennial streams. A contrasting scene is presented on the Coachella Valley floor where the land contains desert vegetation, except where the land has been irrigated with pumped groundwater or with imported Colorado River water. Average annual precipitation ranges from less than 3 inches in the valleys to 40 inches in the San Bernardino Mountains. Seasonal snows fall on the higher elevations in the San Bernardino and San Jacinto mountains. In the valleys, precipitation from summer thunderstorms often exceeds that of winter. Runoff resulting from rains and snowmelt at the higher elevations is the major source of groundwater replenishment. Perennial streams include the upper reaches of the San Gorgonio and Whitewater Rivers, and Palm Canyon, Tahquitz, Snow, Deep Canyon, Chino, and Andreas Creeks. The Whitewater River is the major drainage course in the planning area. There is perennial flow in the mountains, but because of diversions and percolation into the basin, the river becomes dry farther downstream. The constructed downstream extension of the Whitewater River channel, known as the Coachella Valley Storm Water Channel, serves as a drainage way for irrigation return flows, treated community wastewater, and storm runoff. There is one relatively large surface water impoundment. Lake Cahuilla, at the terminus of the Coachella Canal, serves as a storage reservoir to regulate irrigation water demands and is also used for recreational purposes (CRB RWQCB 2024).

Imperial Valley Planning Area comprises 2,500 square miles in the southern portion of the Colorado River Hydrologic Basin, almost all of it in Imperial County. A small portion in the southwestern part of the planning area lies within the San Diego region. The easterly and westerly boundaries are contiguous with the westerly and easterly boundaries of the East Colorado River Basin and the Anza-Borrego Planning Area, respectively. Its northerly boundary is along the Salton Sea and the Coachella Valley Planning Area, and its southerly boundary follows the United States–Mexico border. The planning area's central feature is the flat, fertile Imperial Valley. The principal communities are El Centro, Brawley, and Calexico. Surface waters mostly drain toward the Salton Sea. The New and Alamo Rivers convey agricultural irrigation drainage water from farmlands in the Imperial Valley, surface runoff, and lesser amounts of treated municipal and industrial waste waters from the Imperial Valley. The flow in the New River also contains agricultural drainage, treated and untreated sewage, and industrial waste discharges from Mexicali,

Mexico. Average annual precipitation ranges from less than 3 inches over most of the planning area to about 8 inches in the Coyote Mountains on the western border. Colorado River water, imported via the All American Canal, is the predominant water supply and is used for irrigation, industrial, and domestic purposes (CRB RWQCB 2024).

Groundwater Hydrology

Groundwater supplies in the San Diego region are limited by several factors including the limited distribution of sand and gravel (alluvial) aquifers and their relatively shallow nature, lack of rainfall and associated groundwater recharge, and degraded water quality from human activities. Only a small portion of the region is underlain by permeable geologic formations that can accept, transmit, and yield appreciable amounts of groundwater, which leaves a limited amount of available groundwater.

Groundwater basins underlie about 277,000 acres (433 square miles) or about 11% of the region's surface, and groundwater is found in unconfined alluvial aquifers in most of the region's basins. In some larger basins, typified by those underlying the coastal plain, groundwater occurs in multiple aquifers that create confined groundwater conditions.

The San Diego region overlies three general categories of aquifers: alluvial and sedimentary aquifers, fractured rock aquifers, and desert basin aquifers (County of San Diego 2010). San Diego County is underlain primarily by fractured rock aquifers and alluvial and sedimentary aquifers. Desert basins, which underlie approximately 14% of the unincorporated portion of the county, are located in eastern San Diego County (County of San Diego 2010). Aquifers composed of alluvial deposits (alluvium) yield much of the groundwater production capacity in the region (Regional Water Management Group 2018). Alluvial and sedimentary aquifers (or groundwater basins) underlay a relatively small area of the region and account for approximately 13% of the unincorporated areas. These groundwater basins are typically found in river and stream valleys, around lagoons, near the coastline, and in the intermountain valleys (Figure 4.10-2 maps these groundwater basins). Sediments in these aquifers are composed of mostly consolidated (defined as sedimentary rock) or unconsolidated (defined as alluvium or colluvium) gravel, sand, silt, and clay. Most of these alluvial basins have relatively high hydraulic conductivity, porosity, and storage and generally would be considered good aquifers on the basis of their hydrogeologic characteristics. However, some alluvial basins in the San Diego region have relatively thin saturated thickness and limited storage, but can be underlain by fractured rock aquifers, which can potentially provide additional storage (County of San Diego 2011a). Because alluvial basins generally occur in low-lying areas of a watershed, surface water bodies and surface water runoff may accumulate in streams, lakes, or other surface depressions within alluvial basins may provide additional recharge to these basins. Surface water bodies within an alluvial or sedimentary aquifer may increase the recharge due to leakage from the water body into the subsurface. Alluvial and sedimentary aquifers typically have significant storage capacity, with specific yield values between 1 and 30% (County of San Diego 2010).

The San Diego County Water Authority reports that existing groundwater production produced an annual average of approximately 22,300 acre-feet per year of potable water supplies from groundwater (SDCWA 2021). Aside from the Warner, San Luis Rey Valley, and Sweetwater Valley Basins, none of the region's alluvial aquifers exceed a storage capacity of 100,000 acre-feet. Ten alluvial aquifers, however, are estimated to exceed 50,000 acre-feet (Regional Water Management Group 2018). The San Diego Integrated Regional Water Management (IRWM) contains 22 separate groundwater basins, as defined by the California Department of Water Resources (DWR) Bulletin 118 (Regional Water Management Group 2018). All groundwater basins listed below are alluvial aquifers with the exception of Escondido Valley and El Cajon Valley, which are both alluvial and fractured rock aquifers. These groundwater basins are shown in Figure 4.10-2 and consist of:

- San Mateo Valley
- San Onofre Valley
- Santa Margarita Valley
- San Luis Rey Valley
- Warner Valley
- Escondido Valley
- San Pasqual Valley
- Santa Maria Valley
- San Dieguito Creek
- Poway Valley

- Mission Valley
- San Diego River Valley
- El Cajon Valley
- San Diego Formation (Sweetwater Valley Basin, Otay Valley Basin, and Tijuana Basin were consolidated into one San Diego Formation Basin)
- Batiquitos Lagoon Valley
- San Elijo Valley
- Pamo Valley
- Ranchita Town Area
- Cottonwood Valley
- Campo Valley
- Potrero Valley
- San Marcos Area.

Significant groundwater resources have been found to exist in deeper aquifers composed of semi-consolidated or consolidated sediments. Recent field investigations indicate that one such deep aquifer, the San Diego Formation, has significant unused water storage and groundwater production potential. The San Diego Formation has been estimated to contain approximately 270,000–360,000 acre-feet of groundwater (Regional Water Management Group 2018).

Fractured rock underlies approximately 73% of the unincorporated area of the county. The majority of the mountainous region of the county consists of these fractured rocks, and fractured rock aquifers typically have much less storage capacity than alluvial aquifers (County of San Diego 2011a). Additionally, because of the low storage capacity, recharge to fractured rock aquifers can cause relatively fast rises to the water table, and similarly fast declines to the water table from groundwater pumping in years without significant recharge (County of San Diego 2010). Storage in fractured rock within the county spans several orders of magnitude from essentially zero up to 1% of the total volume of the aquifer. Specific yield values in San Diego County fractured rock are estimated to range from about 0.001–1% (County of San Diego 2010). In some instances, wells may derive water from only one or a few water-bearing fractures. Additionally, it is very difficult to estimate potential production rates for any new well drilled, and wells drilled only a few tens of feet from one another may have significantly different water production rates. This is because water-producing fracture locations and orientations are difficult to identify and predict, and fractures intersected by one well may not be intersected by nearby wells (County of San Diego 2010).

Desert basin aquifers are found in the easternmost area of the San Diego region in residual sediments. Desert basin aquifers are characterized by extremely limited groundwater recharge and large storage capacities (County of San Diego 2011a). In eastern San Diego County, most development occurs over the Borrego Valley Groundwater Basin. The Borrego Valley aquifer (Figure 4.10-2), which is completely groundwater dependent, has a well-documented groundwater overdraft condition where year-after-year groundwater extraction exceeds the amount of groundwater that is recharged back into the aquifer. The land uses in Borrego Valley primarily include residential, agricultural, recreational, and commercial uses. The source of recharge was estimated to come primarily from three major drainages: Coyote Creek (approximately 65%), Borrego Palm Canyon, and San Felipe Creek (approximately 35% when combined with Borrego Palm Canyon). Little recharge, if any from San Felipe Creek benefits users in Borrego Springs because the majority exits Borrego Valley and flows toward Ocotillo Wells (County of San Diego 2010).

Groundwater in the coastal communities of the San Diego region is relatively shallow as a result of the proximity of the ocean and can be approximated based on the elevation of an area. In general, groundwater is encountered a few feet AMSL in Downtown San Diego. Areas close to the San Diego Bay may see daily changes in groundwater level resulting from tidal variation. Groundwater levels in other areas of the San Diego region may be locally affected by temporary dewatering systems for adjacent structures under construction.

WATER QUALITY

This section describes existing groundwater and surface water quality in the region's two hydrologic basins.

San Diego Hydrologic Basin Surface Water and Groundwater Quality

Untreated stormwater can contain a number of pollutants that may eventually flow to surface water and groundwater. A primary cause of water pollution is the discharge of inadequately treated stormwater runoff that is

allowed to discharge into natural receiving waters (e.g., lakes, streams, the ocean). Growth and urbanization have placed increased pressure on water resources and resulted in local impacts on water quality, especially in the highly urbanized western portion of the San Diego region, within the San Diego RWQCB boundaries. The urbanized areas of the region exhibit a large area of impervious surfaces, thus reducing the amount of water that would normally infiltrate into the soil and be filtered naturally. Pollutants, such as motor oil, antifreeze, sediment, metals, fertilizers and pesticides, and bacteria and viruses can be transported to surface waters and groundwater in stormwater runoff. The stormwater conveyance systems in the region are not connected with the sanitary sewer systems; therefore, urban runoff in the region typically flows directly to surface waters and groundwater basins. Current levels of pollution (or impairment) in the region's surface waters are discussed in the sections that follow.

Stormwater Drainage Facilities and Management

The San Diego region includes urban development and associated infrastructure (e.g., roads, sidewalks, gutters, etc.). The conversion of undeveloped areas to urbanized uses in the region's watersheds has contributed to increased runoff rates and volumes, altered drainage patterns, and increased potential for flooding. Construction of impervious surfaces, such as rooftops, roads, and driveways, reduces the amount of rainfall that can infiltrate into the earth and increases runoff within a watershed. Subsequently, artificial conveyances, such as gutters, storm pipes, and concrete-lining channel improvements, accelerate flow rates that are directly conveyed into receiving waters (e.g., streams, rivers, reservoirs, Pacific Ocean) thereby increasing scour (erosion), promoting sediment transport, and concentrating flood risks.

The stormwater drainage system in the San Diego region comprises private and public drainage facilities other than sanitary sewers by which runoff is conveyed to receiving waters; it includes roads, streets, constructed channels, aqueducts, storm drains, pipes, street gutters, inlets to storm drains or pipes, and catch basins. The stormwater drainage system is designed to prevent flooding by transporting water away from developed areas. A vast amount of the unincorporated portion of the San Diego region is rural land that does not support or require stormwater drainage facilities. In contrast, most urban areas in the incorporated cities of the San Diego region have a range of stormwater drainage facilities that convey surface water runoff to the area's water bodies and ultimately the Pacific Ocean. (See Section 4.15, "Public Services, Recreation, and Utilities," for a discussion of existing stormwater drainage facilities within the San Diego region.)

Wastewater Treatment Facilities

The San Diego region is served by over 7,930 miles of pressure and gravity sewer lines, as well as pipes, sewer laterals, and pump stations to move wastewater from its source to a wastewater treatment plant (WWTP) (SWRCB 2024a). The treated wastewater is then released through ocean outfalls, percolation beds, or groundwater recharge.

The San Diego Regional Metropolitan Wastewater Department, the largest wastewater treatment facility in the San Diego region, provides regional wastewater treatment services for the City of San Diego and 15 other cities and sanitation districts: Chula Vista, Coronado, Del Mar, El Cajon, Imperial Beach, La Mesa, National City, and Poway; the Lemon Grove Sanitation District; the Padre Dam Municipal and Otay Water Districts; and the County of San Diego (on behalf of the Winter Gardens Sewer Maintenance District and the Alpine, Lakeside, and Spring Valley Sanitation Districts). The City of San Diego Public Utilities Department operates the Point Loma WWTP, North City Water Reclamation Plant (WRP), South Bay WRP, and the Environmental Monitoring and Technical Services Laboratory. The Point Loma WWTP treats roughly 175 million gallons of wastewater per day (maximum capacity of 240 million gallons per day [mgd]) and discharges it through the Point Loma Ocean Outfall into the Pacific Ocean (City of San Diego n.d.-a). Up to 30 mgd of wastewater can be treated at the North City WRP (City of San Diego n.d.-a). Water processed through the North City WRP is distributed throughout the northern region of San Diego via more than 79 miles of distribution for irrigation, landscaping, and industrial use. The South Bay WRP has the capacity to process 15 mgd (City of San Diego n.d.-a); water processed through the South Bay WRP can either be discharged into the ocean through the South Bay Ocean Outfall or sent on to tertiary treatment to be used for reclaimed water purposes.

The other two largest wastewater treatment facilities in the San Diego region are the Encina Water Pollution Control Facility and the City of Escondido Hale Avenue Resource Recovery Facility (HARRF). The Encina Water

Pollution Control Facility has the capacity to process approximately 43 mgd and treats about 21 mgd (EWA n.d.); the HARRF has the capacity to process 18 mgd and has an average daily flow of 12.7 MGD (City of Escondido n.d.).

Clean Water Act Section 303(d) Impaired Waters

On December 13th, 2024, the US Environmental Protection Agency (EPA) gave partial approval and partial disapproval to the SWRCB's 2024 California Integrated Report (CWA Section 303[d] List and 305[b] Report) (SWRCB 2025). EPA approved the majority of the 303(d) list but identified 53 waterbody-pollutant combinations it is considering adding to the 303(d) list. The impaired water segments and associated pollutants in the San Diego region are identified in Appendix J. Figure 4.10-1 illustrates the location of the region's impaired water body segments. See further description of the 303(d) list in the Regulatory Setting below.)

Placement of a water body onto the 303(d) list requires the RWQCB to make further analysis of the impairment and develop total maximum daily loads (TMDLs) for addressing the impairment. (See further description of TMDLs in the Regulatory Setting below.) Once a TMDL is established, the RWQCB may impose conditions on development either through an implementation plan and schedule for the listed water, or through special conditions required of the jurisdiction affected by the numeric criteria of the TMDL. As of January 23, 2024, several 303(d)-listed water body segments in the San Diego region are at various stages of TMDL development (SWRCB 2024b). SWRCB-approved TMDLs in the San Diego Hydrologic Basin are as follows:

- dissolved copper for Shelter Island Yacht Basin, San Diego Bay (R9-2005-0019)
- diazinon and metals for Chollas Creek (R9-2002-01213 and R9-2007-0043)
- nitrogen and phosphorus for Rainbow Creek (Resolution R9-2005-0036)
- indicator bacteria for Shelter Island Shoreline Park in San Diego Bay (R9-2008-0027)
- indicator bacteria for beaches and creeks in the San Diego Region (R9-2010-0001)
- sediment for Los Peñasquitos Lagoon (Resolution R9-2012-0022)
- phosphorus for Loma Alta Slough (R9-2014-0020)1.

Approved Advance Restoration Plans (ARPs), defined in Section 4.10.2, consist of:

- Tijuana River ARP
- Famosa Slough TMDL Phosphorus
- Loma Alta Slough Nutrient TMDL
- San Mateo Creek Invasive Species TMDL
- Santa Margarita River Estuary TMDL

The following TMDLs are in progress as of April 2024:

- San Diego Bay Investigations:
  - Laurel Hawthorn Central Embayment
  - Mouth of Chollas Creek
  - Shipyards Sediment Site Cleanup
- Tenth Avenue Marine Terminal (Switzer Creek)
  - Lagoon Investigations: Impaired Lagoons, Adjacent Beaches, and Agua Hedionda Creek.

Colorado River Hydrologic Basin Surface Water and Groundwater Quality

The Colorado River is the primary source of imported water supply. High salinity levels, uranium, and perchlorate contamination represent the primary areas of concern with the quality of Colorado River supplies. The salts in the Colorado River system are indigenous and pervasive, mostly resulting from saline sediments in the basin that were

deposited in prehistoric marine environments. They are easily eroded, dissolved, and transported into the river system. Agricultural development and water diversions over the past 50 years increase the already high, naturally occurring levels of TDS. Naturally occurring uranium and arsenic are monitored by drinking water agencies. The Metropolitan Water District adopted a Perchlorate Action Plan in 2002 following detection of perchlorate contamination, which includes continued tracking, remediation, and monitoring (SDCWA 2016).

Areas of Special Biological Significance

The SWRCB's California Ocean Plan identifies 34 locations along the California coast as Areas of Special Biological Significance (ASBS). The Ocean Plan prohibits the discharge of wastes into these locations, thus barring discharges associated with industrial activities, publicly owned treatment works, and other traditional point discharges (SWRCB 2019). In March 2012, the SWRCB released a Special Protections for ASBS, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges that defines design criteria for treating stormwater discharges and elimination of dry-weather discharges associated with non-stormwater sources (SWRCB 2012a). The two ASBS locations in the San Diego region (the La Jolla ASBS and San Diego-Scripps ASBS) are both within the Peñasquitos watershed. These locations are adjacent and extend from the northern bluffs of La Jolla through the University of California San Diego campus of the Scripps Institute Institution of Oceanography (SWRCB 2006).

FLOOD HAZARDS AND FLOOD CONTROL

The San Diego region's climate is semiarid and the seasonal precipitation is highly variable in frequency, magnitude, and location. Infrequent large bursts of rain can cause flash flood events especially in narrow valleys. Flooding in the San Diego region and the rest of Southern California most frequently occurs during winter storm events between November and April, and occasionally during the summer when a tropical storm makes landfall. However, as the San Diego region averages approximately 10 to 13 inches of rainfall annually, flooding is not frequent and usually occurs around the region's coastal lagoons and estuaries, as well as in the lower reaches of rivers and creeks near the Pacific Ocean. Dam failure inundation is flooding caused by the release of impounded water from failure or overtopping of a dam. Areas directly below the dam are at the greatest risk, and as the water moves farther downstream and its depth decreases, the magnitude of the damage and potential risk to life and property decreases. There are 25 dams in the San Diego region; failure of any of these dams would affect downstream areas. Dam owners are required to submit inundation maps to the California Governor's Office of Emergency Services (Cal OES) for review and approval in accordance with guidance issued by Cal OES. Inundation maps submitted by dam owners are provided by DWR (DWR 2025). These inundation maps delineate dam inundation zones, or the areas at risk in the event of failure for each dam. The maps represent the best estimate of where water would flow if a dam failed completely and suddenly with a full reservoir.

Flooding in the San Diego region could also occur as a result of a failure of a levee. Levee Flood Protection Zone (LFPZ) maps were developed by DWR to increase awareness of flood risks associated with state-federal levees. A state-federal levee is a levee that is part of the facilities of the State Plan of Flood Control. LFPZ maps estimate the maximum area that may be flooded if a levee fails with flows at maximum capacity that may reasonably be conveyed. No areas in the San Diego region are in a levee flood protection zone (Caltrans 2025).

The Federal Insurance Rate Map (FIRM) is the official map created and distributed by the Federal Emergency Management Agency (FEMA) and the National Flood Insurance Program (NFIP). The FIRM delineates Special Flood Hazard Areas (SFHAs): areas subject to inundation by the base flood (i.e., the flood having a 1% chance of being equaled or exceeded in any given year; the 100-year flood) for every county and community that participates in the NFIP, including those in the San Diego region. FIRMs contain flood risk information based on historical, meteorological, hydrologic, and hydraulic data, as well as open space conditions, flood control works, and development. Figure 4.10-3 shows FEMA floodway and floodplain areas for the San Diego region, as well as 100-year and 500-year flood zones (i.e., areas having a respective 1 and 0.2% chance of being equaled or exceeded with water in any given year). A floodway is any water channel and adjacent land areas necessary to convey floodwaters, and a floodplain includes the floodway and any land area susceptible to being inundated by floodwaters (FEMA 2011, 2020). In addition to the FEMA FIRMs, the County of San Diego has developed its own

flood maps that account for additional areas of known risk. The County of San Diego flood maps delineate 1% annual chance (100-year) riverine flood boundaries and elevations for areas not studied by FEMA. The County of San Diego Mapping Program has mapped miles of rivers and streams in the unincorporated area.

Seiches and Tsunamis

A seiche is an earthquake or wind-induced wave in a confined body of water, such as a lake, bay, or reservoir. Waves can be up to tens of feet high. Lakes, bays, and reservoirs that could experience a seiche are shown in Figure 4.10-1. There is no historical precedence for large damaging seiches in the San Diego region (SANDAG 2021).

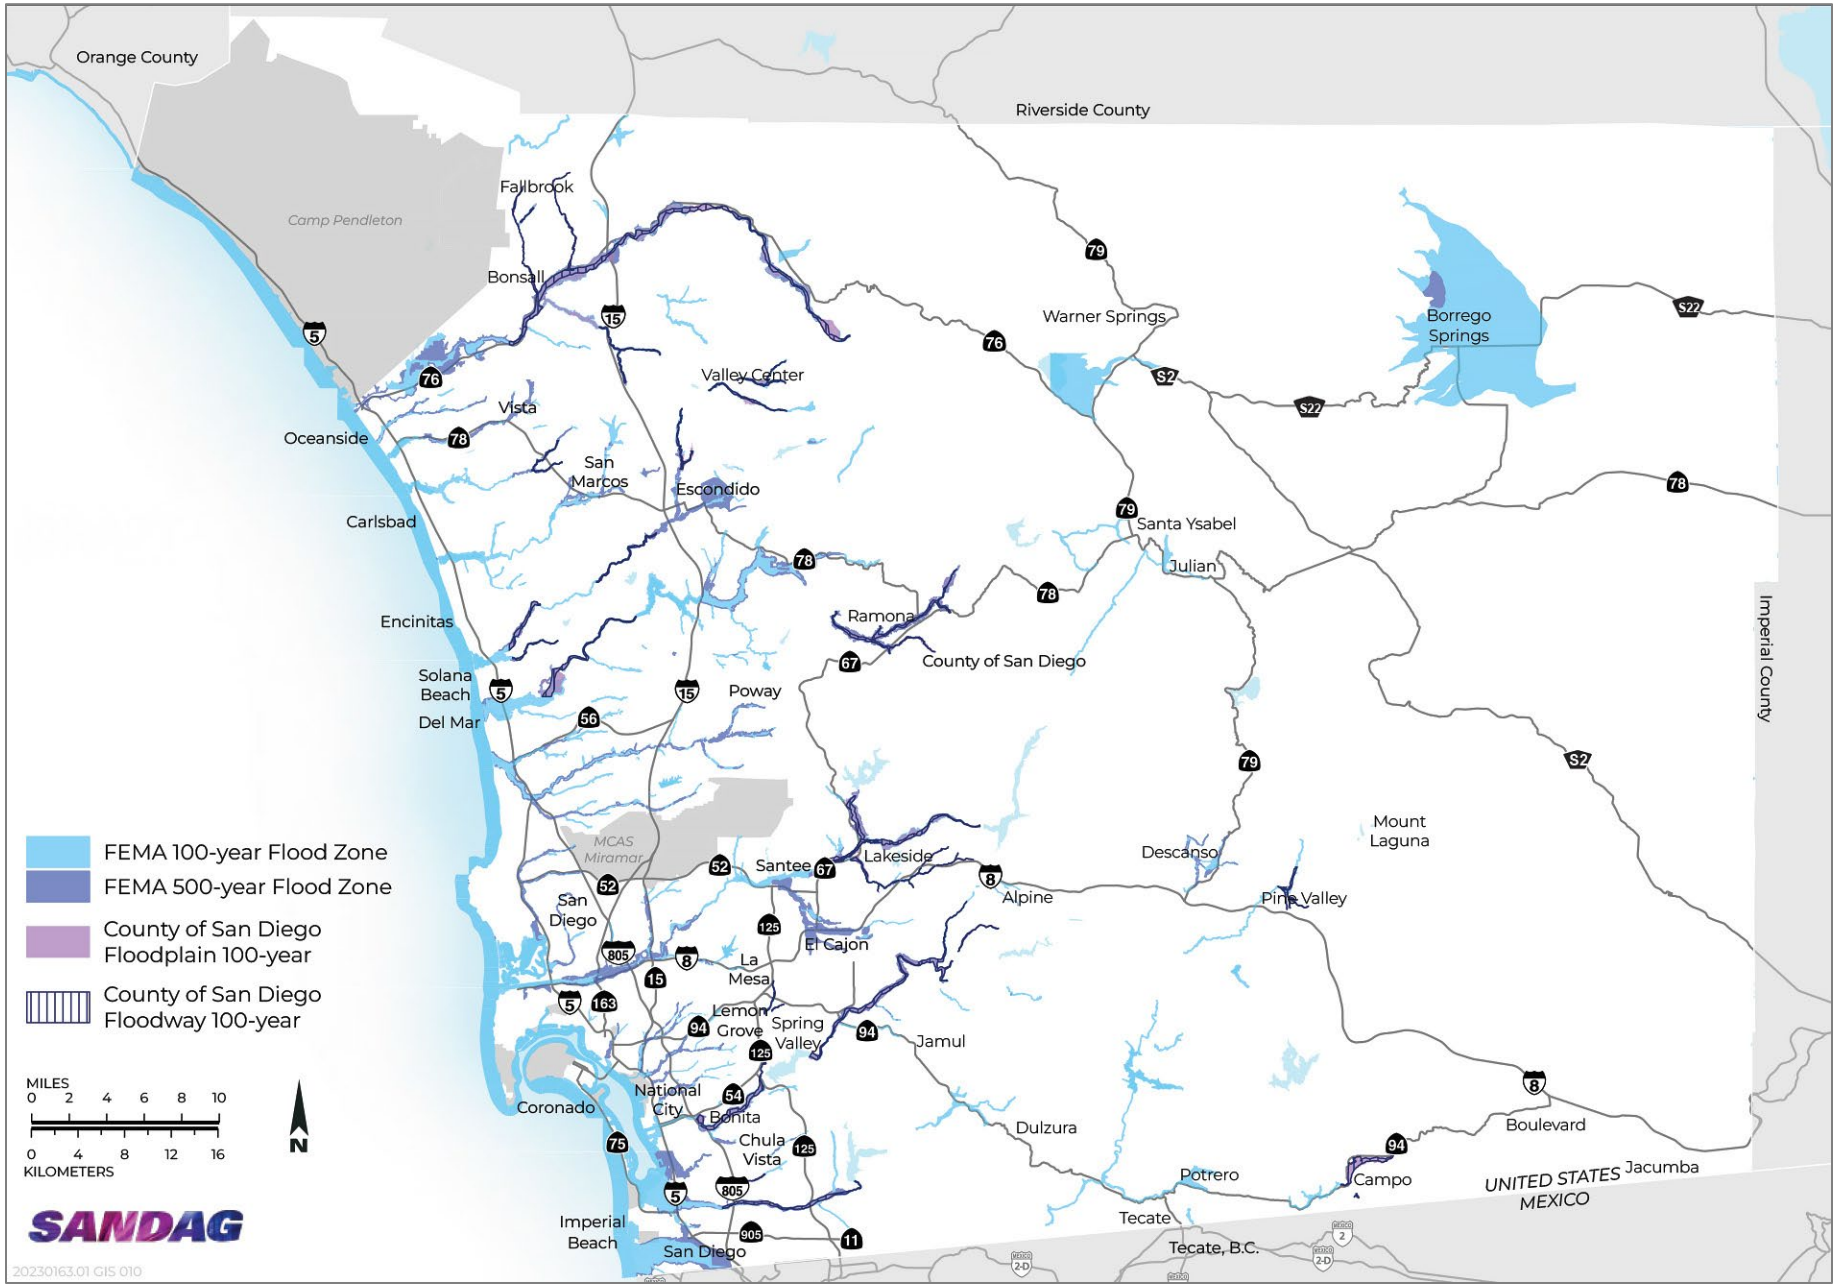
Tsunamis are long-period sea waves generated by an abrupt movement of large volumes of water. These waves can be caused by underwater earthquakes, landslides, volcanic eruptions, meteoric impacts, or onshore slope failures. Seismic conditions and fault zones in the San Diego region are discussed in Section 4.7, "Geology, Soils, and Paleontological Resources." The California Department of Conservation provides detailed maps showing the areas of inundation from tsunamis for the San Diego region that are used to determine whether a project footprint lies within the limits of inundation. These maps are developed for all populated areas at risk to tsunamis in California, and represent a combination of the maximum considered tsunamis for each area.

Maps are available by quadrangle for each affected coastal area/community in the San Diego region: Del Mar, Encinitas, Imperial Beach, La Jolla, National City, Oceanside-San Luis Rey, Point Loma, and San Onofre Bluff. Tsunami hazards would be limited to the lower shoreline elevations along the Pacific coast, San Diego Bay, Mission Bay, and five coastal lagoons. The risk of tsunamis in the San Diego region is low. In 92 years of record, at least 19 tsunamis have been recorded in the San Diego region, with most only a few tenths of a meter in height. The largest tsunami, caused by the Chilean earthquake in 1960, produced waves 1.5 meters in height causing damage to piers (Barberopoulou et al. 2011). Between 1854 and 2010, San Diego experienced numerous tsunamis generated by both local and distant earthquakes, including sources as far away as Japan, Chile, Alaska, Hawaii, Kamchatka, Indonesia, Ecuador, and the Aleutians. The most powerful earthquakes, such as the Chilean earthquake in 1960, the Alaskan earthquakes in 1964 and 2004 (Indonesia), and the Rat Islands earthquake in 1957, produced the most significant impacts. While many other events, such as those in 1854, 1923, 1944, and 1952, produced smaller waves of 0.1–0.7 meters, minor damage to harbor infrastructure still occurred. The February 27, 2010 Chile tsunami, with a magnitude of 8.8, produced waves 0.4 meter in height, strong currents, and flooding near Imperial Beach. Smaller events, such as the December 26, 2004 Indonesia tsunami, were detectable by tide gauges, showing that San Diego's harbor has consistently recorded the effects of major global seismic events (Barberopoulou et al. 2011).

ANTICIPATED EFFECTS FROM CLIMATE CHANGE

The San Diego region is likely to experience a variety of climate change impacts including longer and more intense droughts, sea-level rise of up to 1.3 feet by 2050 and up to 6.7 feet by 2100, fewer rainy days, more rainfall during the biggest rainstorms by 2050, and a decrease in runoff and streamflow due to less snowpack and more evaporation (CEP and SDF 2015; Kalansky et al. 2018; OPC 2024; Jennings et al. 2018). When it rains, these climate change effects make the region more susceptible to accelerated erosion and increased mudflow. (Higgs 2024).

Climate change can also worsen water quality in a variety of the region's water resources through increased nonpoint water pollution (i.e., pollution that enters water bodies from a variety of sources) during severe storm events, saltwater intrusion resulting from sea-level rise, sediment from increased incidence of wildfires, and higher temperatures. Heavier storms may decrease both beach and surface water quality because rainfall causes contamination from nonpoint source pollutants such as trash, fertilizers, sediments, metals, sewage, and other fluids, which then drain into the ocean, rivers, reservoirs, and streams. As a result, California health officials recommend that people stay out of the ocean for at least 72 hours following rain events of at least 0.1 inch (Schiff et al. 2016). In 2024, San Diego saw a number of beach closures and advisories due to high bacteria levels, primarily from sewage runoff, particularly from the Tijuana River. La Jolla Children's Pool, Coronado, the Silver Strand, Mission Bay, and Imperial Beach all experienced closures (Anastas 2024; CNS 2024; Smith 2024). The San Diego region may see 8 percent more precipitation during its heaviest storms by 2050 and these more intense rainstorms from climate change may worsen hazardous runoff (CEP and SDF 2015).



Sources: Data downloaded FEMA in 2022 and SANGIS in 2025; adapted by Ascent in 2025.

Figure 4.10-3 Flood Zone and Floodplain Map

Climate change could cause these incidents to increase in frequency or severity. Along the coast, saltwater intrusion from sea-level rise can infiltrate groundwater, worsening the quality of freshwater resources. Projected increases in wildfires across the region may also worsen water quality for surface waterbodies by increasing risk for severe flooding, erosion, and sediment, nutrient, and metal flows into rivers, lakes, and reservoirs (USGS 2023). Additionally, higher temperatures may lead to longer stratification periods (a seasonal separation of water into layers) driving harmful algae blooms, fish die-offs, and increased methane emissions (Tandon 2021).

4.10.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS AND POLICIES

Clean Water Act

The federal Clean Water Act (CWA) (33 U.S. Code [USC] Section 1251 et seq.) of 1972 is the basic federal law that addresses surface water quality control and protection of beneficial uses of water. The objective of the CWA is to restore and maintain the chemical, physical, and biological integrity of the nation's waters through prevention, reduction, and elimination of pollution. The CWA applies to discharges of pollutants into waters of the United States. The CWA establishes a framework for regulating stormwater discharges from municipal, industrial, construction, and other activities under National Pollutant Discharge Elimination System (NPDES) regulations. In California, SWRCB administers the NPDES program. The following CWA sections are most relevant to regulation of surface water in the San Diego region.

Section 303(d): Total Maximum Daily Loads and Water Quality Standards

Under Section 303(d) of the CWA, states, territories, and authorized tribes are required to develop a list of water quality–limited segments. Waters on the 303(d) list do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. The law requires that states, territories, and authorized tribes establish priority rankings for water bodies on the 303(d) list and develop action plans (i.e., TMDLs) to improve water quality. As defined by the CWA, water quality standards consist of four elements:

- designated beneficial uses of water bodies
- water quality criteria to protect designated uses
- an antidegradation policy to maintain and protect existing uses and high-quality waters
- general policies addressing implementation issues.

Under CWA Section 303(d) (33 USC Section 1313[d]), states, territories, and authorized tribes are required to develop a list of water bodies that are considered to be "impaired" from a water quality standpoint. Water bodies that appear on this list either do not meet or are not expected to meet water quality standards, even after the minimum required levels of pollution control technology have been implemented to reduce point-source discharges. The law requires that respective jurisdictions establish priority rankings for surface water bodies on the list and develop action plans (TMDLs) to improve water quality. A TMDL is a calculation of the maximum amount of a specific pollutant that a water body can receive and still meet federal water quality standards as provided in the CWA (EPA 2024). TMDLs account for all sources of pollution, including point sources, nonpoint sources, and natural background sources.

The CWA Section 303(d) list of impaired water bodies provides a prioritization and schedule for development of TMDLs for states. The SWRCB, in compliance with CWA Section 303(d), publishes the list of water quality–limited segments in California, which includes a priority schedule for development of TMDLs for each contaminant or "stressor" affecting the water body (SWRCB 2025). An ARP, as defined by the United States Environmental Protection Agency, is a near-term plan or description of actions, with a schedule and milestones, that can in some cases be more immediately beneficial or practicable than a TMDL in achieving water quality objectives. An ARP is not a substitute for a TMDL, but rather is designed to address impairments prior to the development of a TMDL.

Section 401: Water Quality Certification

Every applicant for a federal permit or license for any activity that may result in a discharge to a water body must obtain a CWA Section 401 (33 USC Section 1341) Water Quality Certification for the proposed activity and must comply with state water quality standards prescribed in the certification. SWRCB and the RWQCBs are responsible for issuing Section 401 Water Quality Certifications. Most certifications are issued in connection with CWA Section 404 US Army Corps of Engineers (USACE) permits for dredge and fill material discharges.

Section 402: NPDES Program

CWA Section 402 (33 USC Section 1342) sets forth regulations that prohibit the discharge of pollutants into waters of the United States from point or nonpoint sources without first obtaining an NPDES permit. SWRCB and the nine RWQCBs administer the NPDES permit program. SWRCB implements the NPDES and the state's water quality programs by regulating discharges of pollutants to surface waters to protect their beneficial uses. To comply with the CWA water quality regulations, nine RWQCBs in California develop and enforce WQOs and implementation plans, issue waste discharge requirements (WDRs) that integrate NPDES permit requirements, take enforcement action, and monitor water quality within their hydrologic areas.

To regulate runoff-related (nonpoint source) discharges, SWRCB developed a variety of general NPDES permits for controlling industrial, construction, and municipal stormwater discharges (general permits for each category described separately under "State Laws, Regulations, Plans, and Policies," below). Stormwater discharges are permitted under the NPDES program. Section 402(p) of the CWA requires that municipal stormwater management programs be developed and implemented for municipalities to meet the requirements for stormwater discharges from municipal permits. Stormwater management programs limit, to the maximum extent practicable, the discharge of pollutants from storm sewer systems. A single agency or a coalition, often consisting of more than one municipality (such as cities and counties), may implement these programs. Each program includes best management practices (BMPs) intended to reduce the quantity and improve the quality of stormwater discharged to the stormwater system. Discharges to storm sewer systems must comply with the stormwater management program's requirements.

Section 404: Discharge of Dredge or Fill Material

CWA Section 404 (33 USC Section 1344) establishes a permit program, administered by USACE with EPA oversight, regulating discharge of both dredged and fill materials into waters of the United States (as defined in 33 CFR 328.3[a]), including wetlands. Dredged material means material that is excavated or dredged from waters of the United States. Fill material means material placed in waters of the United States where the material has the effect of replacing any portion of a waters of the United States with dry land or changing the bottom elevation of waters of the United States. Examples of fill material are rock, sand, soil, clay, plastics, woodchips, concrete, and materials used to create any structure or infrastructure in waters of the United States. Activities in waters of the United States that are regulated under this program include fills for development, water resource projects (such as dams and levees), infrastructure development (such as highways and airports), and conversion of wetlands to uplands for farming and forestry.

Under CWA Section 404(e), USACE can issue general permits to authorize activities that have minimal individual and cumulative adverse environmental effects. General permits can be issued for a period of no more than 5 years. USACE can issue nationwide permits, which is a general permit that authorizes activities across the country, unless revoked by a district or division commander. Nationwide permits authorize a wide variety of activities, such as linear transportation projects, residential development, commercial and industrial developments, utility lines, road crossings, bank stabilization activities, wetland and stream restoration activities, and certain maintenance activities.

Section 10 of the Rivers and Harbors Act

Section 10 of the Rivers and Harbors Act, administered by USACE, prohibits the creation of any obstruction, excavation, or fill, or any alteration or modification of any navigable water of the United States unless the work has been permitted by USACE (33 USC Section 403). Permits for activities including excavation and dredging or deposition of material, or any obstruction or alteration to a navigable water that could impact water quality, are regulated under both Section 404 (CWA) and Section 10 (Rivers and Harbors Act), and are processed simultaneously by the USACE.

Federal Antidegradation Policy

The federal antidegradation policy (40 CFR Section 131.12) has been in existence since 1968. The policy protects existing uses, water quality, and national water resources. It directs states to adopt a statewide policy that includes the following primary provisions:

- Maintain and protect existing instream uses and the water quality necessary to protect those uses.
- Where existing water quality is better than necessary to support fishing and swimming conditions, maintain and protect water quality unless the state finds that allowing lower water quality is necessary for important local economic or social development.
- Where high-quality waters constitute an outstanding national resource, such as waters of national and state parks, wildlife refuges, and waters of exceptional recreational or ecological significance, maintain and protect that water quality.

Executive Order 11988: Floodplain Management

An amendment to Executive Order (EO) 11988 was issued on January 28, 2015, and includes revised guidelines for implementing EO 11988. Amended EO 11988 directs federal agencies to avoid, to the extent practicable and feasible, short- and long-term adverse impacts associated with the occupancy and modification of floodplains, and to avoid direct and indirect support of floodplain development wherever a practicable alternative exists. Each federal agency is responsible for reducing the risk of flood loss, minimizing the impact of floods on human safety, health, and welfare, and restoring and preserving natural and beneficial values served by flood plains. In addition, amended EO 11988 advises agencies to use a higher flood elevation and expanded flood hazard area than the base flood previously described in EO 11988 to ensure that climate change and other future changes are more adequately accounted for in agency decisions.

National Flood Insurance Act of 1968

The National Flood Insurance Act of 1968 established the NFIP. The NFIP is a federal program administered by the Flood Insurance Administration of the FEMA. It enables individuals who have property within the 100-year floodplain to purchase insurance against flood losses. Community participation and eligibility, flood hazard identification, mapping, and floodplain management aspects are administered by state and local programs and support directorate within FEMA. FEMA works with the states and local communities to identify flood hazard areas and publishes a flood hazard boundary map of those areas.

The basic tools for regulating construction in potentially hazardous floodplain areas are local zoning techniques and FEMA floodplain mapping. FIRM is the official map created and distributed by FEMA and the NFIP that delineates SFHAs—areas that are subject to inundation by a base flood—for every county and community that participates in the NFIP. FIRMs contain flood risk information based on historical, meteorological, hydrologic, and hydraulic data, as well as open space conditions, flood control works, and development. For projects that would affect the hydrologic or hydraulic characteristics of a flooding source and modify an existing regulatory floodway, effective base flood elevations, or an SFHA, a conditional letter of map revision would need to be approved by FEMA.

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

California Ocean Plan

The California Ocean Plan implements standards for ensuring consistency between water quality control plans and policies (SWRCB 2019). In the adoption and amendment of water quality control plans, each plan provides for the attainment and maintenance of the water quality standards of downstream waters. To the extent there is a conflict between a provision of the California Ocean Plan and a provision of another statewide plan or policy, or a regional water quality control plan (basin plan), the more stringent provision shall apply except where pursuant to Chap. III.J of the California Ocean Plan (SWRCB 2019).

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) (Water Code Section 13000 et seq.) implements and augments federal protections under the CWA via regulation of the waters of the state, which include surface, ground, and ocean water, as well as point sources and nonpoint sources.

The Porter-Cologne Act is California's comprehensive water quality control law and is a complete regulatory program designed to protect water quality and beneficial uses of the state's waters. It requires the nine RWQCBs to adopt water quality control plans (basin plans) for watersheds within their regions. These basin plans are reviewed triennially and amended as necessary by the RWQCBs.

Each basin plan establishes water quality standards for specified surface waters and groundwater, which consist of beneficial uses and WQOs. WQOs may be numeric or narrative.

Where waste discharges could affect the quality of the waters of the state, the discharger must obtain a WDR permit. SWRCB and the RWQCBs have issued general WDRs governing certain categories of discharges. WDRs typically include effluent limitations, monitoring, and plan submittals that are to be implemented for protecting water quality.

State Antidegradation Policy (Resolution 68-16)

The state's antidegradation policy restricts degradation of surface and ground waters. This policy protects water bodies where existing quality is higher than necessary for the protection of beneficial uses. The state policy establishes two conditions that must be met before the quality of high-quality waters may be lowered by waste discharges.

1. The state must determine that lowering the quality of high-quality waters:
    - will be consistent with the maximum benefit to the people of the state
    - will not unreasonably affect present and anticipated beneficial uses of such water
    - will not result in water quality less than that prescribed in state policies (e.g., WQOs in water quality control plans).
2. Any activities that result in discharges to high-quality waters are required to:
    - meet WDRs that will result in the best practicable treatment or control of the discharge necessary to avoid pollution or nuisance
    - maintain the highest water quality consistent with the maximum benefit to the people of the state.

The discharge would not be allowed under Resolution 68-16 if the discharge, even after treatment, would unreasonably affect beneficial uses or would not comply with applicable provisions of water quality control plans.

Cobey-Alquist Flood Plain Management Act

The Cobey-Alquist Flood Plain Management Act (Water Code Sections 8400 et seq.) encourages local governments to plan, adopt, and enforce land use regulations to accomplish floodplain management, in order to protect people and property from flooding hazards. This act also provides state financial assistance for flood control projects.

2019 Final San Diego Integrated Regional Water Management Plan

The Final 2019 San Diego IRWM Plan was prepared under the direction of the Regional Water Management Group consisting of the San Diego County Water Authority, the County of San Diego, and the City of San Diego (Regional Water Management Group 2018). The IRWM Plan builds on local water and regional management plans within the San Diego region and is aimed at developing long-term water supply reliability, improving water quality, and protecting natural resources. The statewide IRWM program is supported by bond funding provided by DWR to fund competitive grants for projects that improve water resources management. IRWM Plan goals are to:

- improve the reliability and sustainability of regional water supplies
- protect and enhance water quality
- protect and enhance our watersheds and natural resources

- enhance resiliency to climate change for local water resources
- promote and support sustainable integrated water resource management.

California Fish and Game Code Section 1602

All diversions, obstructions, and changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California that supports wildlife resources are subject to regulation by the California Department of Fish and Wildlife (CDFW), under the Fish and Game Code Section 1602.

Under Section 1602, it is unlawful for any person, governmental agency, or public utility to do the following without first submitting a complete notification of lake or streambed alteration to CDFW:

- substantially divert or obstruct the natural flow of, or substantially change or use any material from, the bed, channel, or bank of any river, stream, or lake
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

The regulatory definition of a stream is a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation. CDFW's jurisdiction within altered or artificial waterways is based on the value of those waterways to fish and wildlife. A lake or streambed alteration agreement must be obtained from CDFW for any activity that may substantially adversely affect an existing fish or wildlife resource.

Municipal Stormwater Permit

Section 402(p) of the CWA requires that stormwater discharges are permitted under the NPDES program for municipal separate storm sewer systems (MS4s). As part of the NPDES MS4 permit process, stormwater management programs must be developed and implemented for municipalities to meet the requirements for stormwater discharges listed in MS4 permits. Stormwater management programs limit, to the maximum extent practicable, the discharge of pollutants from storm sewer systems. A single state agency or a coalition, often consisting of more than one municipality (such as cities and counties), may implement these programs. Each program includes BMPs intended to reduce the quantity and improve the quality of stormwater discharged to the stormwater system. Discharges to storm sewer systems must comply with the stormwater management program's requirements.

In 1990, EPA promulgated regulations establishing NPDES regulations for MS4s serving "medium" and "large" MS4s of 100,000 population or greater. These regulations, known as Phase I regulations, require operators of medium and large MS4s to obtain and comply with NPDES stormwater permits to reduce or eliminate the discharge of pollutants.

On December 8, 1999, EPA promulgated regulations, known as Phase II regulations, requiring operators of small MS4s to obtain and comply with NPDES stormwater permits for small MS4s under the authority of CWA Section 402(p)(6). On February 5, 2013, SWRCB adopted Water Quality Order No. 2013-0001-DWQ, NPDES General Permit No. CAS000004 (as amended by Orders 2015-0133_EXEC, WQ 2016-0069-EXEC, WQ 2018-0001-EXEC, and 2018-0007-EXEC), Waste Discharge Requirements for Storm Water Discharges from Small MS4 (Phase II General Permit) to comply with CWA Section 402(p)(6). The Phase II General Permit became effective on July 1, 2013.

In compliance with this requirement, the county and cities in San Diego County developed stormwater management programs, which are discussed in more detail under "Local Laws, Regulations, Plans, and Policies," below.

California Department of Transportation NPDES Permit

Under the California Department of Transportation (Caltrans) statewide NPDES permit (Order 2012-0011-DWQ, as amended by Order WQ 2014-0006-Exec, Order WQ 2014-0077-DWQ, and Order WQ 2015-0036-Exec), Caltrans is required to regulate nonpoint-source discharges from its properties, facilities, and activities (SWRCB 2012b), such as the following.

- stormwater discharges from all Caltrans-owned municipal separate stormwater sewer systems

- stormwater discharges from Caltrans' vehicle maintenance, equipment cleaning, and operations facilities, and any other nonindustrial facilities with activities that have the potential to generate significant quantities of pollutants
- certain categories of non-stormwater discharges, as listed under Provision B in Order 2012-0011-DWQ.

Order 2012-0011-DWQ does not regulate stormwater discharges from Caltrans-owned batch plants or any other industrial facilities. Caltrans must obtain coverage for stormwater discharges associated with industrial activities under the statewide Industrial General Permit for these discharges, and must comply with the applicable requirements. Although Order 2012-0011-DWQ does not regulate stormwater discharges associated with industrial activities, it does impose contractor requirements for certain industrial facilities.

Order 2012-0011-DWQ also does not regulate discharges from Caltrans construction activities, including dewatering effluent discharges from construction projects. Instead, Caltrans must obtain coverage for stormwater discharges associated with construction activities under Order 2022-0057-DWQ (previously Order 2009-0009-DWQ as amended by Orders 2010-0014-DWQ and 2012-0006-DWQ), the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit) (SWRCB 2022).

Construction General Permit

Dischargers whose projects disturb 1 or more acres of soil, or less than 1 acre but are part of a larger common plan of development that in total disturbs 1 or more acres, are required to obtain coverage under the SWRCB's Order 2022-0057-DWQ (previously Order 2009-0009-DWQ as amended by Orders 2010-0014-DWQ and 2012-0006-DWQ), the Construction General Permit (SWRCB 2022). Construction and demolition activities subject to this permit include clearing, grading, grubbing, and excavation, or any other activity that results in a land disturbance equal to or greater than 1 acre.

Permit applicants are required to submit a notice of intent to SWRCB and to prepare a stormwater prevention pollution plan (SWPPP). The SWPPP must identify BMPs that are to be implemented to reduce construction impacts on receiving water quality based on potential pollutants. The SWPPP also must include descriptions of the BMPs to reduce pollutants in stormwater discharges after all construction phases are completed at a site (postconstruction BMPs). The Construction General Permit also includes requirements for risk-level assessment for construction sites, a stormwater effluent monitoring and reporting program, and numeric action levels for pH and turbidity.

Industrial General Permit

Industrial facilities are subject to the requirements of SWRCB Water Quality Order 2014-0057-DWQ (as amended by Order 2015-0122-DWQ and 2018-0028-DWQ), NPDES General Permit for Storm Water Discharges Associated with Industrial Activities Excluding Construction Activities (Industrial General Permit). These regulations prohibit discharges of industrial stormwater to waters of the United States and state from a broad range of industrial activities, including mining, manufacturing, disposal, recycling, and transportation, unless such discharges comply with a site-specific NPDES permit.

Special Protections for Areas of Special Biological Significance

On March 20, 2012, SWRCB approved Resolution No. 2012-0012 approving an exception to the Ocean Plan prohibition against discharges to Areas of Special Biological Significance (ASBS) for certain nonpoint-source discharges and NPDES-permitted municipal stormwater discharges. State Water Board Resolution No. 2012-0012 requires monitoring and testing of marine aquatic life and water quality in several ASBS to protect California's coastline during storm discharges into coastal waters. Specific terms, prohibitions, and special conditions were adopted to provide special protections for marine aquatic life and natural water quality in ASBS. The City of San Diego's municipal stormwater discharges to the San Diego Marine Life Refuge in La Jolla are subject to terms and conditions of State Water Board Resolution No. 2012-0012. The special protections are contained in Attachment B to Resolution No. 2012-0012.

California Coastal Act

Section 30231 of the California Coastal Act establishes a policy of maintaining and restoring the biological productivity and water quality of coastal waters, streams, wetlands, estuaries, and lakes within the Coastal Zone. Section 30236 addresses flood control projects for the protection of existing structures in the floodplain. Section 30253, Part(a) establishes a policy that that new development must minimize risks to life and property in areas of high flood hazard.

Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act (SGMA) requires basins to be sustainably managed by local public agencies (e.g., counties, cities, and water agencies) that become groundwater sustainability agencies (GSAs). The primary purpose of the GSAs is to develop and implement a Groundwater Sustainability Plan (GSP) to achieve long-term groundwater sustainability. Within the county, three groundwater basins have been designated as medium- and high-priority basins by the state under the SGMA. These include Borrego Springs, San Luis Rey Valley, and San Pasqual Valley. See Section 4.18, "Water Supply," for further discussion on this topic.

San Diego Regional Water Quality Control Board

As described above, the Porter-Cologne Act requires that RWQCBs adopt water quality control plans (basin plans) for watersheds within their jurisdiction. These plans establish water quality standards for particular surface water bodies and groundwater resources.

The San Diego RWQCB (Region 9), a state agency, is responsible for the basin plan for the San Diego Basin. The RWQCB implements management plans to modify and adopt standards under provisions set forth in Section 303(c) of the CWA and California Water Code (Division 7, Section 13240). In addition to basin plan requirements, the RWQCB issues water quality certifications under CWA Section 401. The RWQCB also regulates discharges to surface waters and groundwater through the issuance of WDRs. WDRs are issued for discharges that specify limitations relative to the Basin Plan (San Diego RWQCB 2021).

Water Quality Control Plan for the San Diego Basin

The preparation and adoption of basin plans are required by the California Water Code (Section 13240) as prescribed by the CWA. According to Section 13050 of the Water Code, basin plans include designation or establishment of beneficial uses to be protected, WQOs to protect those uses, and a program of implementation needed for achieving the objectives for the waters within a specified area. Basin plans satisfy both state and federal regulatory requirements for water quality control.

Water Quality Objectives

The San Diego RWQCB Basin Plan sets narrative and numerical WQOs that must be attained or maintained to protect beneficial uses and conform to the state's antidegradation policy. The WQOs are the levels of water quality constituents that must be met to protect the beneficial uses. A list of these water quality constituents that received narrative or numerical concentration objectives is identified below (San Diego RWQCB 2021). A complete and detailed list of WQOs can be found in the Basin Plan. Each water quality constituent may result in varied objectives conditional on the beneficial use of the waters.

Water Quality Constituents

- Bacteria: total coliform, fecal coliform, *E. Coli*, and enterococci
- Biostimulatory substances
- Boron
- Chlorides
- Color
- Dissolved oxygen
- Floating material
- Fluoride

- Inorganic chemicals[1]
- Iron
- Manganese
- Methylene blue–activated substances
- Nitrate
- Oil and grease
- Organic chemicals
- Pesticides
- pH
- Phenolic compounds
- Radioactivity
- Secondary drinking water standards[2]
- Sediment
- Sodium
- Sulfate
- Suspended and settleable solids
- Tastes and odors
- Temperature
- TDS
- Toxicity
- Toxic pollutants[3]
- Trihalomethanes
- Turbidity
- Un-Ionized ammonia

Beneficial Uses/Water Quality Objectives

Beneficial uses are defined as the uses of water necessary for the survival or well-being of humans, plants, and wildlife. Beneficial uses identified for surface waters in the Water Quality Control Plan for the San Diego Basin (Basin Plan) (San Diego RWQCB 2021) for the San Diego region are:

- MUN: municipal and domestic supply
- AGR: agricultural supply
- IND: industrial service supply
- PROC: industrial process supply
- GWR: groundwater recharge
- FRESH: freshwater replenishment
- NAV: navigation
- POW: hydropower generation
- REC-1: contact water recreation
- REC-2: non-contact water recreation
- COMM: commercial and sport fishing

[1] Waters designated for use as domestic or municipal supply (MUN) cannot contain concentrations of inorganic chemicals in excess of the maximum contaminant levels set forth in California Code of Regulations, Title 22, Table 64431-A of Section 64431 (Inorganic Chemicals), which is incorporated by reference into the Basin Plan. Inorganic chemicals include aluminum, antimony, arsenic, asbestos, barium, beryllium, cadmium, chromium, cyanide, fluoride, mercury, nickel, nitrate, nitrate+nitrite, nitrite, selenium, and thallium.

[2] Water designated for use as domestic or MUN cannot contain concentrations of chemical constituents in excess of the maximum contaminant levels specified in 64449-A of Section 64449 of Title 22 of the California Code of Regulations (Secondary Maximum Contaminant Levels, Consumer Acceptance Limits), which is incorporated by reference into the Basin Plan. Chemical constituents are aluminum, color, copper, corrosivity, foaming agents, iron, manganese, methyl tert-butyl ether, odor threshold, silver, thiobencarb, turbidity, and zinc.

[3] EPA promulgated a final rule prescribing water quality criteria for toxic pollutants in inland surface waters, enclosed bays, and estuaries in California on May 18, 2000 (the California Toxics Rule or "CTR" [40 CFR 131.38]). CTR criteria constitute applicable water quality criteria in California. In addition to the CTR, certain criteria for toxic pollutants in the National Toxics Rule (40 CFR 131.36) constitute applicable water quality criteria in California as well. The Shelter Island Yacht Basin portion of San Diego Bay is designated as an impaired water body for dissolved copper pursuant to CWA Section 303(d). A TMDL has been adopted to address this impairment.

- BIOL: preservation of biological habitats of special significance
- AQUA: aquaculture
- WARM: warm freshwater habitat
- COLD: cold freshwater habitat
- EST: estuarine habitat
- MAR: marine habitat
- WILD: wildlife habitat
- RARE: rare, threatened, or endangered species
- MIGR: migration of aquatic organisms
- SHELL: shellfish harvesting
- SPWN: spawning, reproduction, and/or early development
- CUL: tribal tradition and culture
- T-SUB: tribal subsistence fishing
- SUB: subsistence fishing

Beneficial uses identified in the Basin Plan (San Diego RWQCB 2021) for coastal waters are:

- IND: industrial service supply
- NAV: navigation
- REC-1: contact water recreation
- REC-2: non-contact water recreation
- COMM: commercial and sport fishing
- BIOL: preservation of biological habitats of special significance
- EST: estuarine habitat
- WILD: wildlife habitat
- RARE: rare, threatened, or endangered species
- MAR: marine habitat
- AQUA: aquaculture
- MIGR: migration of aquatic organisms
- SPWN: spawning, reproduction, and/or early development
- WARM: warm freshwater habitat
- SHELL: shellfish harvesting.

Traditionally, groundwater supplies in the San Diego region have produced high-quality drinking water. However, naturally occurring and more recent anthropogenic sources of contamination have decreased groundwater quality in some localized areas throughout the county. Groundwater contamination from anthropogenic sources are typically associated with leaking underground storage tanks, such as from gasoline stations or other industrial uses with underground storage tanks. SWRCB maintains the GeoTracker database of several types of such sites in California, including permitted underground storage tanks; leaking underground storage tanks; and Spills, Leaks, Investigations, and Cleanups sites. According to GeoTracker, there are over 3,000 leaking underground storage

tank listings in the San Diego region (SWRCB 2025). Not all of these sites represent areas of groundwater contamination, but they do identify the potential extent of possible localized areas of contamination. While alluvial groundwater aquifers can be quickly recharged by stormwater or urban runoff, the porous nature of the aquifers render them susceptible to contamination by activities on the ground surface, such as septic tank use in rural areas in the San Diego region, contaminated stormwater infiltration, abandoned well heads, and leaking underground storage tanks. The most common contaminants in groundwater in the San Diego region are elevated nitrate, TDS, iron, manganese, and toxic organic pollutants (Regional Water Management Group 2018).

Beneficial uses identified in the Basin Plan (San Diego RWQCB 2021) for groundwaters the San Diego region are:

- MUN: municipal and domestic supply
- AGR: agricultural supply
- IND: industrial service supply
- IPS: industrial process supply
- freshwater replenishment.

Narrative and numeric water quality objectives (WQOs) for all surface waters and groundwater within the San Diego region are established for a variety of constituents as described in the Basin Plan. Refer to Tables 3-9 and 3-10 in the Basin Plan (San Diego RWQCB 2021) for specific WQOs for each HA for inland surface waters and groundwater, respectively.

Colorado River Basin Regional Water Quality Control Board

The Colorado River Basin RWQCB's goal is to maintain the existing water quality of all nondegraded ground water basins. However, in most cases, groundwater that is pumped generally returns to the basin after use with an increase in mineral concentrations, such as TDS and nitrate, that are picked up by water during its use. Under these circumstances, the RWQCB's objective is to minimize the quantities of contaminants reaching any ground water basin. This could be achieved by establishing management practices for major discharges to land. Until the RWQCB can complete investigations for the establishment of management practices, the objective will be to maintain the existing water quality where feasible.

Colorado River Basin Plan

Beneficial uses identified for surface waters in the Water Quality Control Plan for the Colorado River Basin (CRB RWQCB 2024) for the San Diego region are:

- MUN: municipal and domestic supply
- AGR: agriculture supply
- AQUA: aquaculture
- IND: industrial service supply
- GWR: groundwater recharge
- REC-1: water contact recreation
- REC-2: non-contact water recreation
- WARM: warm freshwater habitat
- COLD: cold freshwater habitat
- WILD: wildlife habitat
- POW: hydropower generation
- FRSH: freshwater replenishment

- RARE: preservation of Rare, threatened, or endangered species
- LREC I: limited water contact recreation.

The groundwater quality discussion for this region is focused on the Borrego Valley Groundwater Basin. The most extensive water quality monitoring data in the Borrego Springs Subbasin comes from reporting by public water supply systems to the SWRCB Division of Drinking Water for the purpose of ensuring adequate drinking water quality (BVGSA 2019). There are both anthropogenic and natural sources of the contaminates of concern (COCs) in the Borrego Springs Subbasin. Anthropogenic sources that may contribute to degradation of the current water quality in the subbasin include agricultural use of pesticides and fertilizers, salt accumulation resulting from agricultural irrigation practices, and household septic system return flows. Natural sources of COCs in the subbasin include the rocks and minerals that make up the aquifer matrix material. These naturally occurring COCs contain evaporite minerals, which can dissolve and increase TDS concentration in the aquifer; silicate minerals, which can contribute arsenic to the groundwater; and sulfate minerals, which can contribute sulfate to the groundwater. All are found in differing amounts in the upper, middle, and lower aquifers. Differences in the mineralogical composition of the aquifers can result in groundwater quality differences between the aquifers (BVGSA 2019).

In general, water quality has historically been good in Borrego Water District's wells with TDS at concentrations of less than 500 milligrams per liter. The high proportion of sulfate in the surface water of Coyote Creek appears to dominate the character of groundwater in the northern and eastern parts of the basin. The more bicarbonate waters of Borrego Palm Canyon and Big Spring influence the groundwater along the western and southern parts of the basin. Historical issues with elevated nitrate concentrations have been noted as evidenced by wells either taken out of production or drilled deeper. High salinity, poor-quality connate water is thought to occur in deeper formational materials in select areas of the aquifer as well as shallow groundwater in the vicinity of the Borrego Sink in the southern portion of the Plan area. Water quality impacts may occur because decreased groundwater levels could induce flow of poor-quality water (i.e., unsuitable for municipal uses) found in select deeper formational materials of the aquifer. This may eventually necessitate additional expensive treatment of groundwater to make the water suitable as a drinking water supply (BVGSA 2019).

Beneficial uses identified in the Colorado River Basin Plan (CRB RWQCB 2024) for groundwaters in the San Diego region are:

- MUN: municipal and domestic supply
- AGR: agricultural supply
- IND: industrial service supply.

Establishment of numerical objectives for ground water involves complex considerations because the quality of ground water varies significantly with depth of well perforations, existing water levels, geology, hydrology and several other factors. The RWQCB indicates that detailed investigation of the ground water basins should be conducted before establishing specific ground WQOs (CRB RWQCB 2024).

LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

San Diego Regional Municipal Storm Water Permit

The San Diego Regional Municipal Storm Water Permit (Order R9-2013-0001 [as amended by Order No. R9-2015-0001 and R9-2015-0100]) (Municipal Storm Water Permit) regulates the conditions under which stormwater and non-stormwater discharges into and from MS4s are prohibited or limited. The 18 cities, County of San Diego government, County of San Diego County Regional Airport Authority, and San Diego Unified Port District each owns or operates an MS4, through which it discharges stormwater and non-stormwater into waters of the United States within the San Diego region. These entities are the County of San Diego Copermittees (Copermittees) which, along with the applicable Orange County and Riverside County Copermittees, are subject to the requirements of the permit. The Caltrans stormwater system is regulated separately under the Caltrans NPDES permit.

The Municipal Permit is a framework for protecting water quality and designated beneficial uses of waters of the state from adverse impacts resulting from MS4 discharges. The Municipal Permit requires that each jurisdiction covered under the permit implement a jurisdictional urban runoff management program to control the contribution of pollutants to and the discharges from the MS4. The goal of the jurisdictional runoff management programs is to implement water quality improvement strategies and runoff management programs that effectively prohibit non-stormwater discharges into the Copermittees' MS4s and reduce pollutants in stormwater discharges from the Copermittees' MS4s to the maximum extent practicable.

The MS4 permit, required by NPDES, requires the development of a hydromodification management plan (HMP). Pursuant to RWQCB Order 2007-0001, provision D.1.g, HMPs shall be prepared with the purpose of managing increases in runoff discharge rates and durations from specific projects, where such increased rates and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. Regulations require site design to account for hydrology and drainage studies are required for projects with significant increases in impervious surfaces. Projects are discouraged from diverting or increasing flows that cross a site. Larger projects (those with 50 acres of disturbance or greater) are subject to hydromodification requirements and must develop a project-level HMP.

The Municipal Permit requires that the Copermittees develop a WQIP for each of 10 WMAs in the San Diego region. These plans identify the highest priority water quality conditions in each watershed and specific goals, strategies, and schedules to address those priorities, including numeric goals and action levels, and requirements for water quality monitoring and assessment. The Copermittees implement strategies through their jurisdictional runoff management programs to achieve the goals of the water quality improvement plans.

In accordance with the provisions of the Municipal Permit, the County of San Diego developed a BMP Design Manual to identify design requirements and related postconstruction requirements to protect stormwater quality for new development and significant redevelopment in the incorporated cities and unincorporated areas of the San Diego region (County of San Diego 2020). The BMP Design Manual establishes a series of source control, site design, and treatment control BMPs that are to be implemented by all priority development projects (PDPs). PDPs include new development, redevelopment projects that create, add, or replace 5,000 square feet, and pollutant generating projects. A PDP should refer to the local agency that has jurisdiction for the project for guidance on the source control, site design, and treatment control BMPs for stormwater pollutants. All future projects implementing the proposed Plan must adhere to these regulations.

Under the Municipal Permit, Copermittees are required to implement stormwater management requirements and controls, which include construction and postconstruction requirements for stormwater BMPs. These requirements include implementing low impact development (LID) BMPs for development and significant redevelopment to reduce pollutants in stormwater runoff from sites through more natural processes such as infiltration and biofiltration.

The County of San Diego developed an LID handbook for guidance in the BMP selection process, which integrates current research on LID implementation in the San Diego region (County of San Diego 2014a). Design techniques include minimizing impervious areas, conserving natural areas, and using vegetation and landscaping for water quality treatment benefits.

Copermittees are also required to comply with hydromodification management requirements to mitigate the potential for increased erosion due to increased runoff rates and durations caused by development and increased impervious surfaces. The Municipal Permit requires Copermittees to implement hydromodification management requirements to manage increases in runoff discharge rates and durations from PDPs to minimize erosion of channel beds and banks, sediment pollutant generation, or other impacts on beneficial uses and stream habitat. The hydromodification management requirements are found Chapter 6 in the BMP Design Manual. The hydromodification management requirements require PDPs to implement hydrologic control measures so that post-project runoff flow rates and durations do not exceed predevelopment flow rates and durations.

Water Quality Control Policy for Siting, Design, Operation, and Maintenance of On Site Wastewater Treatment Systems

On June 19, 2012, SWRCB adopted Resolution No. 2012-0032, adopting the Water Quality Control Policy for Siting, Design, Operation, and Maintenance of On-Site Wastewater Treatment Systems (OWTS) Policy. This policy establishes a statewide, risk-based, tiered approach for the regulation and management of OWTS installations and replacements and sets the level of performance and protection expected from OWTS (SWRCB 2012c).

In accordance with Water Code Section 13290 et seq., the policy sets standards for OWTS that are constructed or replaced, that are subject to a major repair, that pool or discharge waste to the surface of the ground, or that have affected, or will affect, groundwater or surface water to a degree that makes it unfit for drinking water or other uses, or cause a health or other public nuisance condition. The OWTS policy also includes minimum operating requirements for OWTS that may include siting, construction, and performance requirements; requirements for OWTS near certain waters listed as impaired under Section 303(d) of the CWA; requirements authorizing local agency implementation of the requirements; corrective action requirements; minimum monitoring requirements; exemption criteria; requirements for determining when an existing OWTS is subject to major repair; and a conditional waiver of waste discharge requirements.

On April 15, 2015, the San Diego RWQCB adopted a basin plan amendment that changed WQOs for nitrate in groundwater basins. The basin plan amendment also incorporates the State Water Quality Control Policy for Siting, Designing, Operation, and Maintenance of OWTS and made updates related to implementation of waste discharge requirements and adopted resolutions. The Office of Administrative Law approved the San Diego Water Board's Nitrate/OWTS Policy Basin Plan amendment on May 17, 2016 (San Diego RWQCB 2024). The basin plan amendment incorporates the OWTS Policy into the Basin Plan and amends the criteria to be used by the San Diego Water Board and local agencies to regulate OWTS in the San Diego region (San Diego RWQCB 2021).

Metropolitan Transit System

Metropolitan Transit System (MTS) is regulated under Resolution No. R9-2017-0006 for compliance with SWRCB Order 2013-0001-DWQ NPDES Permit No. CAS000004 (February 8, 2017). MTS was established as a special district in California and is authorized to operate public mass transit in the cities of Chula Vista, Coronado, El Cajon, Imperial Beach, La Mesa, Lemon Grove, National City, Poway, San Diego, and Santee, as well as the unincorporated areas of the County of San Diego not served by the North County Transit District (NCTD). In accordance with the resolution, the San Diego RWQCB requested an amendment to include MTS as a Nontraditional Small MS4. MTS and applied for coverage under the Phase II General Permit. SWRCB adopted Order WQ 2018-007-EXEC amending WQ Order 2013-0001-DWQ on March 13, 2018, to add MTS as a nontraditional permittee.

North County Transit District

NCTD has been regulated under SWRCB Water Quality Order No. 2013-0001-DWQ NPDES Permit No. CAS000004 since July 1, 2013. The jurisdiction boundary of the permit extends from the southern Orange County border on MCB Camp Pendleton (mile post [MP] 207.4) to south Del Mar (MP 245.7). MTS owns the City of San Diego portion of the rail corridor in San Diego County from MP 245.7 to MP 267.5, including the San Diego Trolley light rail and bus system. The stormwater management plan serves as the stormwater compliance document for all of the NCTD right-of-way, maintenance facilities, transit stations, and centers. All projects that create or replace between 2,500 and 5,000 square feet of impervious surface must implement one or more site design measures. NCTD regulates all development projects that create or replace 5,000 square feet or more of impervious surface (regulated projects). NCTD requires these regulated projects to implement measures for site design, source control, runoff reduction, stormwater treatment, and baseline hydromodification management as defined in the MS4 general permit.

Dewatering Permit

Discharges from specified groundwater extraction activities (such as construction dewatering) must be permitted either by the San Diego RWQCB under the General Order R9-2015-0013 for groundwater waste discharges to surface waters, or authorized by the agency with jurisdiction if discharged to an MS4. Discharge via either of these mechanisms must meet applicable WQOs, constituent limitations, and pretreatment requirements.

County of San Diego Multi-Jurisdictional Hazard Mitigation Plan

The federal Disaster Mitigation Act of 2000 requires all local governments to create a disaster plan in order to qualify for hazard mitigation funding. The Multi-Jurisdictional Hazard Mitigation Plan is a countywide plan that identifies risks and ways to minimize damage by natural and human-made disasters. The plan is a comprehensive resource document that serves many purposes, such as enhancing public awareness, creating a decision tool for management, promoting compliance with state and federal program requirements, enhancing local policies for hazard mitigation capability, and providing inter-jurisdictional coordination.

Each of the 18 cities in the county participated in the planning process, as well as the Alpine Fire Protection District, Rancho Santa Fe Fire Protection District, and Padre Dam Municipal Water District. According to a review of jurisdictional-level hazard maps, the central and eastern portions of San Diego County are most susceptible to flash floods where mountain canyons, dry creek beds, and high deserts are the prevailing terrain. In regions such as San Diego, without extended periods of below-freezing temperatures, floods usually occur during the season of highest precipitations or during heavy rainfalls after long dry spells (County of San Diego 2023).

Approximately 270,263 people may be at risk of the 100-year flood hazard. In addition, special populations at risk that may be impacted by the 100-year flood hazard in San Diego County include low-income households and elderly people. Approximately 585,882 people are at risk of the 500-year flood hazard (County of San Diego 2023).

County of San Diego Floodplain Management Plan

The County of San Diego Floodplain Management Plan (FMP) assesses the flooding hazards in the unincorporated areas of San Diego County, summarizes current County of San Diego programs, describes potential mitigation strategies, and presents a plan for future action (County of San Diego 2007). It was prepared with input from county residents, responsible officials, and consultants, and with the support of Cal OES and FEMA. The FMP discusses a series of flood hazard issues and presents follow-up actions and recommendations for risk reduction. Using the findings and recommendations in each of these areas, the county developed a mitigation action plan (MAP). The County's hazard MAP identifies mitigation activities, the priority assigned to implementing each activity, a responsible lead department or staff position, and deadline.

County and City General Plans and Flood Ordinances

Local general plans address flood hazards through policies in their land use and safety elements. In addition, local floodplain management ordinances (e.g., the County of San Diego Flood Damage Prevention Ordinance, the City of San Diego floodplain ordinance [Chapter 14, Article 3, Division 1]) promote public health, safety, and general welfare, and minimize public and private losses due to flood conditions. Flood ordinances restrict uses that are dangerous to health, safety, and property due to erosion or water hazards; require uses vulnerable to floods to be protected from flood damage at the time of construction; control the alteration of natural floodplains; control filling, grading, or dredging that may increase flood damage; and prevent construction of flood barriers that divert flood waters or increase flood hazards in other areas. Flood ordinances also include design standards for abutments to prevent collapse or lateral movement during a 100-year flood. Goals of floodplain management and flood ordinances within the San Diego region include:

- Reduce or eliminate existing flood hazards.
- Prevent future flood hazards from developing.
- Reduce the economic losses associated with flooding events.
- Provide for expanded recreational and aesthetic opportunities in the County of San Diego.
- Restore, preserve, and enhance environmental quality wherever possible.
- Improve the quality of life in the San Diego region.

The *County of San Diego General Plan Safety Element* discusses potential risks of flooding, dam failure, safety procedures, involved agencies, and current and future action policies (County of San Diego 2011b). The Safety Element introduces safety considerations for planning and decision-making to reduce the risk of injury, loss of life,

and property damage associated with various hazards identified in the element, including flooding. The Safety Element also proposes policies and recommendations aimed at enhancing public safety through prevention as well as response preparation. The Safety Element provides goals and polices related to emergency response for natural or human-induced disasters in the region.

County of San Diego Local Agency Management Program for On Site Wastewater Treatment Systems

The Local Agency Management Program (LAMP), updated in February 2025, allows the continued use of OWTS in the jurisdiction of the County of San Diego and expands the local program to permit and regulate alternative OWTS while protecting water quality and public health (County of San Diego 2025). The LAMP also applies to OWTS on federal, state, and tribal lands to the extent authorized by law or agreement. The LAMP includes minimum standards for the treatment and ultimate disposal of sewage though the use of OWTS in San Diego County and is designed to protect groundwater sources and surface water bodies from contamination through the proper design, placement, installation, maintenance, and assessment of individual OWTS.

City of San Diego Stormwater Standards Manual

The Stormwater Standards Manual (City of San Diego 2024) provides the requirements for controlling discharges of pollutants in stormwater associated with construction and permanent phases of development project to ensure new development project comply with federal and state permitting. Specifically, the manual provides guidance for complying with, updated on-site post-construction stormwater requirements for Standard Projects and Priority Development Projects (PDPs), and provides updated procedures for planning, preliminary design, selection, and design of permanent stormwater BMPs based on the performance standards presented in the MS4 Permit.

City of San Diego Manual Standard Operating Procedures

The Standard Operating Procedures Administrative Procedures for Floodplain Management and Compliance (City of San Diego 2023) provides the requirements for minimum actions required for the intake, review, acceptance and recordkeeping of all new and substantially improved projects, as well as all repairs due to substantial damage when proposed in a Special Flood Hazard Area (SFHA) and/or near a Levee. All City departments are responsible for coordinating effectively to ensure that all projects comply with the City's municipal code.

4.10.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts in the form of Initial Study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the checklist questions that address the criteria in CEQA Guidelines Appendix G. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR, and the unique characteristics of the proposed Plan.

Checklist questions for hydrology and water quality impacts are provided in Section X of CEQA Guidelines Appendix G. For purposes of this EIR, the CEQA Guidelines Appendix G, Section X questions have been combined and modified as follows.

- Question (a) regarding water quality standards, waste discharge requirements, and degradation of surface water and groundwater quality; the portion of question (c)(iii) regarding substantial additional sources of polluted runoff; and the portion of question (e) regarding conflicts with implementation of a water quality control plan are all addressed in HWQ-1.
- Question (b) addressing decreases in groundwater supplies and substantial interference with groundwater recharge and the portion of question (e) addressing impediments to sustainable management of groundwater basins and the conflict with or obstruction of implementation of a sustainable groundwater management plan have been incorporated into significance criterion WS-2 in Section 4.18, "Water Supply."

- Question (c), including (c)(i), addressing substantial drainage pattern alterations is included in HWQ-2. The portion of question (c)(iii) regarding the creation or contribution of runoff water in excess of existing or planned stormwater drainage system capacity is addressed in significance criterion U-1 in Section 4.15, "Public Services, Recreation, and Utilities."
- Question (c), including (c)(ii) and (c)(iv), addressing flooding is included in HWQ-3.
- Question (d) addressing risk of pollutant release in a flood hazard, tsunami, or seiche zone is included as HWQ-4.

For purposes of this EIR, implementation of the proposed Plan would have a significant hydrology or water quality impact if it would:

HWQ-1 Substantially degrade surface water or groundwater quality, including in violation of any water quality standards or waste discharge requirements, in conflict with a water quality control plan or its implementation, or as a result of substantially altering the existing drainage pattern of the area in a manner which provides substantial additional sources of polluted runoff.

HWQ-2 Substantially alter the existing drainage pattern of an area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site.

HWQ-3 Substantially alter the existing drainage pattern of an area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would (i) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site or (ii) impede or redirect flood flows.

HWQ-4 Substantially increase risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone.

The analysis discloses potential impacts to hydrology and water quality. There is not enough evidence to support that climate change effects would worsen the proposed Plan's hydrology and water quality impacts, with the exception of flooding. Due to existing laws and regulations, the hydrology and water quality (HWQ-1 and HWQ-2) impacts of the proposed Plan are unlikely to worsen with future climate change. Analysis would be speculative and is not included in this section. However, because there is literature available that suggests the impacts of the proposed Plan on flooding may worsen with climate change, this literature and analysis are discussed in the HWQ-3 and HWQ-4 impact analyses.

4.10.4 Environmental Impacts and Mitigation Measures

HWQ-1 SUBSTANTIALLY DEGRADE SURFACE WATER OR GROUNDWATER QUALITY, INCLUDING IN VIOLATION OF ANY WATER QUALITY STANDARDS OR WASTE DISCHARGE REQUIREMENTS OR IN CONFLICT WITH A WATER QUALITY CONTROL PLAN OR ITS IMPLEMENTATION, OR AS A RESULT OF SUBSTANTIALLY ALTERING THE EXISTING DRAINAGE PATTERN OF THE AREA IN A MANNER WHICH PROVIDES SUBSTANTIAL ADDITIONAL SOURCES OF POLLUTED RUNOFF.

Analysis Methodology

The analysis identifies and maps the existing impaired (i.e., 303[d]-listed) water bodies and the locations where land development from forecasted regional growth and changes to land uses and planned transportation network improvements would occur for each time horizon. The analysis evaluates whether the proposed Plan would result in significant discharges of a pollutant for which a waterbody is already impaired, which could further exacerbate an existing water quality standard violation and result in a significant impact or result in a new discharge that could impair water quality. Construction and operation (i.e., postconstruction) of development projects and transportation network improvements are analyzed to determine whether they would contribute substantial

additional sources of pollutants found in stormwater runoff from these types of projects and improvements, would substantially degrade water quality in violation of any water quality standards or WDRs, or would conflict with or obstruct implementation of a water quality control plan. Projects that comply with the Construction General Permit (2022-0057-DWQ) and local MS4 permit requirements under San Diego Regional Municipal Storm Water Permit (Order R9-2013-0001 [as amended by Order No. R9-2015-0001 and R9-2015-0100]), and implement BMPs to the maximum extent practicable would generally not conflict with or obstruct implementation of the water quality control plan. In addition, the analysis evaluates whether those additional sources of pollutants have the potential to infiltrate into and adversely affect groundwater quality.

The operational analysis of transportation network improvements focuses on improvements that would create new impervious surfaces that would collect pollutants from vehicles, consisting of, but not limited to, new Managed Lanes, general purpose lanes, regional arterial projects, and transit centers with parking areas. Active transportation projects and new transit services or transit service improvements would not be major sources of new pollutants during operation and are not analyzed in detail in this section for operational water quality impacts.

The analysis also considers that construction and postconstruction activities would be required to adhere to various federal, state, and regional water quality standards, such as the Municipal Permit, Industrial General Permit, and Construction General Permit. Therefore, runoff volumes and pollutants leaving sites during construction and postconstruction operations would be substantially reduced through source control, site design, and treatment-control BMPs mandated by these permits. Erosion and sediment controls identified for construction in project-specific SWPPPs would substantially reduce the amount of soil disturbance, erosion and sediment transport into receiving waters, and pollutants in site runoff during construction.

Impacts from the proposed Plan would be considered significant if the proposed Plan contributes substantial additional sources of pollutants leading to water quality standards or waste discharge requirements being violated, conflicts with the water quality control plan, substantially degrades water quality, or provide substantial sources of polluted runoff due to implementation of the forecasted regional growth and land use change and planned transportation network improvements.

Water quality impacts associated with wastewater discharge from wastewater treatment facilities (e.g., Point Loma WWTP and Ocean Outfall, North City WRP, and South Bay WRP) are analyzed. Forecasted regional growth and land use change would generate additional wastewater, which would be treated by regional wastewater treatment facilities. Information from Section 4.15, "Public Services, Recreation, and Utilities," is used to identify planned capacity of wastewater treatment facilities and future expansion needs of the facility. The analysis determines whether additional demand for wastewater treatment from forecasted regional growth and land use change would contribute to violation of water quality standards or WDRs for wastewater treatment facilities. Transportation network improvements and programs would not generate additional demand for wastewater treatment and therefore are not analyzed for a contribution to violation of WDRs for wastewater treatment facilities. Impacts on groundwater quality also are analyzed for forecasted regional growth and land use change in areas without sewer systems that are reliant on septic tanks or other alternative wastewater systems.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Construction activities associated with regional growth and land use change under the proposed Plan would generate pollutants, such as sediment, soil stabilization residues, oil and grease, and trash and debris. Construction-related ground-disturbing activities would result in short-term water quality impacts associated with soil erosion and subsequent sediment transport to adjacent properties or watercourses via storm drains. Development under the proposed Plan would also increase the amount of impervious surface area in the region, such as new buildings and paved areas. The new impervious surface areas would collect common urban pollutants, such as sediment, oil and grease, metals, nutrients, and trash and debris. Development under the proposed Plan would also increase the amount of managed landscaping areas in the region that would provide sources of nutrients, herbicides, and irrigation runoff.

Most development by 2035 would consist of infill development and redevelopment in existing urban and suburban communities that are already highly developed with impervious surfaces. As shown in Table 2-1 in Chapter 2, "Project Description," of this Draft EIR, approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Infill and redevelopment would incrementally increase the amount of impervious surface area in existing urban and suburban communities. Conversely, the limited development forecasted on vacant land, open space, and agricultural land would cause greater increases in impervious surfaces (and associated polluted runoff) than infill and redevelopment.

Generally, increases in the amount of impervious surfaces and landscaped areas would result in the accumulation, exposure, and transport of additional pollutants. Runoff during storm events and non-stormwater flows (such as over-irrigation) would transport pollutants through the storm drain system and adversely affect surface and groundwater water quality if not properly managed. Several creeks and coastal lagoons have existing water quality impairments; therefore, any increase in pollutant concentrations from new development would impact water quality, particularly for waterbodies listed as impaired under CWA Section 303(d). However, pollutant types and concentrations in runoff would depend on numerous site- and location-specific factors, consisting of, but not limited to, land use type, presence of source control and structural BMPs, site drainage conditions, intensity and duration of rainfall, and climatic conditions preceding a rainfall event.

Compliance with regional, state, and federal water quality regulations, such as the CWA implemented by Porter-Cologne Act, Water Code Section 13000 et seq.; NPDES regulations; and the Municipal Permit, would ensure that the increased runoff volume and pollutants generated from development are effectively treated. Development associated with forecasted growth and land use change under the proposed Plan would be subject to regulatory requirements that substantially reduce surface water quality impacts during construction and postconstruction. Construction BMPs that reduce erosion and subsequent sediment transport, such as silt fences, fiber rolls, sandbags, berms, and drainage inlet protection, would be implemented during construction activities in compliance with the Construction General Permit. For any ground disturbances greater than 1 acre, a SWPPP would be implemented. The SWPPP would identify sources of pollutants and erosion and the pollution control BMPs that would be implemented during construction to minimize pollutants in stormwater runoff. Implementation of water quality control measures and BMPs would ensure that water quality standards would be achieved, including the WQOs that protect designated beneficial uses of surface and groundwater, as defined in the Basin Plan.

During operation and maintenance of development projects, practices would be implemented to reduce stormwater pollution and prevent water quality degradation as required by applicable regulation, such as the Municipal Stormwater Permit. Development projects would be required to maintain predevelopment hydrology in compliance with enforced hydromodification requirements (Municipal Permit). Postconstruction BMPs would consist of, but are not limited to, the following permanent stabilization designs and stormwater quality treatment measures:

- reestablishment of native vegetation to control erosion
- LID designs that reduce, treat, infiltrate, and manage stormwater runoff and facilitate groundwater recharge (i.e., detention basins, bioretention systems, infiltration areas, porous paving)

- runoff conveyance designs that provide adequate storage capacity and overland flow, detention, and infiltration before runoff reaches culverts or detention systems
- in-line systems such as oil and sediment separators or absorbent filter systems to provide stormwater filtration prior to discharge
- hydromodification measures that ensure post-project stormwater runoff does not exceed the predevelopment flow and duration
- regular street cleaning, litter control, and catch basin cleaning.

Regional growth and land use change associated with the proposed Plan would also contribute additional demand for wastewater treatment in 2035. As a result, wastewater discharges (primarily residential, commercial, and industrial) from regional wastewater treatment plants, such as the Point Loma WWTP and Ocean Outfall, North City WRP, and South Bay WRP) would increase. Treated wastewater from regional wastewater treatment plants are discharged to surface waters, including the Pacific Ocean.

Although population growth would result in an increase in the amount of wastewater generated, especially in the cities of San Marcos and Chula Vista, the existing wastewater treatment plants would have sufficient capacity to serve forecasted growth through 2035 (see Section 4.15). However, smaller treatment plants throughout the region would need to be expanded to ensure they have adequate capacity while also protecting surface, ground, and marine water resources. Development in existing communities would require expansion or upsizing of existing collection and treatment systems, whereas development in new areas would require installation of new collection and treatment systems. Wastewater treatment facility/infrastructure expansions would be required to comply with ongoing point-source discharge NPDES permits, as well as applicable NPDES general permits and assorted local regulations to minimize impacts on receiving waters.

Marine water quality is regularly monitored by the City of San Diego Environmental Monitoring and Technical Services Laboratory to ensure that the wastewater discharge does not negatively affect water quality or harm aquatic health. This monitoring program would continue, relative to new regulatory permit requirements for evaluating and ensuring compliance.

Compliance with applicable regulatory requirements outlined above, including CWA implemented by Porter-Cologne Act, Water Code Section 13000 et seq.; NPDES regulations; the Municipal Permit; and Construction General Permit, and in Section 4.10.2, "Regulatory Setting," would require that predevelopment hydrology be maintained after construction is completed; runoff would be treated to remove or substantially reduce pollutants before discharging to surface waters. For projects that discharge to 303(d)-listed impaired water bodies, mandatory BMPs would be implemented to substantially lessen the quantity of pollutants causing the impairment from leaving the site and entering the impaired water body. Wastewater discharges would be in compliance with applicable NPDES permit requirements. Therefore, regional growth and land use change associated with the proposed Plan would not substantially degrade water quality in violation of water quality standards or WDRs, conflict with a water quality control plan or its implementation, or provide substantial sources of polluted runoff. This impact is less than significant.

Transportation Network Improvements and Programs

Transportation infrastructure would contribute to water quality impacts during construction and operations. Construction activities associated with transportation network improvements would increase erosion and subsequent sediment transport to adjacent properties, roadways, or watercourses via storm drains. Construction activities would also generate pollutants, such as sediment, soil stabilization residues, oil and grease, and trash and debris, that could contaminate runoff or receiving waters. In addition, bridge and roadway modifications across water courses would be required. Construction disturbances and dredging would have an adverse impact on turbidity affecting water quality, particularly for receiving waters listed as impaired for sediment or siltation.

Transportation network improvements under the proposed Plan would also increase the amount of impervious surface area in the region, including new paved areas. New impervious surfaces including freeways, roadways, and parking lots would convey common urban pollutants to landscaped areas. The primary source of water pollution

from transportation infrastructure is vehicles and associated oil and grease, metals, sediment, hydrocarbons, trash and debris accumulated on paved surfaces (EPA 2025). The main pollutants associated with railway are polycyclic aromatic hydrocarbons (PAHs), heavy metals, and herbicides. The main source of PAHs in railway areas is from machine grease, fuel oils and transformers oils, and creosote (railway ties) (Wiłkomirski et al. 2010). Sources of heavy metals include rail material abrasion, fuel combustion in diesel-electric locomotives, trolley wires, and cargo leakage. Runoff during storm events and non-stormwater flows (such as over-irrigation) would transport these pollutants through the local storm drain systems. If not properly managed, pollutants in runoff discharged from local storm drain systems could adversely affect surface water quality (particularly CWA Section 303[d]–impaired water bodies). In general, bicycle improvements and other active transportation projects do not collect the same type of pollutants as transportation facilities used by vehicles, and therefore, runoff from such improvements would not discharge similar vehicle-related pollutants into storm drains and receiving waters.

As shown in Table 4.10-1, a variety of transportation network improvements proposed by 2035 cross 303(d)-listed water bodies. Most improvements would occur in areas that are already highly developed with impervious surfaces. By 2035, most projects that would cross 303(d) waters would either be active transportation projects or local improvements to the regional arterial system, streets, or roads with a more limited potential to introduce large acreages of new impervious surface area. Although these facilities are primarily developed urban areas, they also cross 303(d)-listed waters, including rivers, creeks, and lagoons. Transportation network improvements in semirural and rural areas would result in greater increases in impervious surface area and collection of pollutants relative to existing conditions, which would degrade surface water or groundwater quality, conflict with a water quality control plan or its implementation, or provide substantial sources of polluted runoff.

Table 4.10-1 Planned Transportation Network Improvements Crossing 303(d)-Listed Water Bodies by 2035

Improvement Type	Project Name	Impaired Waterbody	Hydrologic Unit #
Bike			
	Bayshore Bikeway Segment 1	San Diego Bay	18070304
	Coastal Rail Trail Encinitas	Cottonwood Creek (San Marcos Creek watershed)	18070303
	Coastal Rail Trail Oceanside	Loma Alta Creek	18070303
		Loma Alta Slough	18070303
	Coastal Rail Trail San Diego: Carmel Valley to Roselle via Sorrento	Los Peñasquitos Creek	18070304
		Soledad Canyon	18070304
	Coastal Rail Trail San Diego: Mission Bay (Clairemont to Tecolote)	Tecolote Creek	18070304

Notes: I = Interstate; SR = State Route; ML = Managed Lane; UTC = University Town Center.

Source: SWRCB 2018; adapted by Ascent 2025.

As discussed in the "Regional Growth and Land Use Change" section above, specific regulations, such as the statewide Construction General Permit, are in place to substantially reduce the water quality impacts of construction activities on receiving waters, including 303(d)-listed waters; the Caltrans Statewide Storm Water Program and Management Plan sets forth requirements to substantially reduce or eliminate the discharge of pollutants from construction activities for Caltrans facilities. The need for and design of BMPs would be dictated by the project-related SWPPP and the presence of surrounding sensitive resources. During the SWPPP development process, BMPs would be selected that target the construction-phase pollutant(s) of concern relative to adjacent impaired 303(d)-listed water bodies, and operation-phase BMPs would be evaluated during the development of drainage designs. Construction BMPs aimed at reducing erosion and subsequent sediment transport, such as silt fence or fiber rolls, sandbag barrier, and slope stabilization, would be implemented during construction activities to substantially reduce or eliminate the discharge of pollutants into receiving waters, including 303(d)-listed water bodies. Implementation of BMPs would also ensure that water quality standards would be achieved, including the WQOs that protect designated beneficial uses of surface and groundwater, as defined in the Basin Plan.

During operations and maintenance of transportation network improvement projects, operational BMPs would be implemented and maintained to substantially lessen the flow of stormwater pollutants into receiving waters, including 303(d)-listed water bodies, to prevent substantial water quality degradation in compliance with

applicable stormwater runoff discharge permits (i.e., Municipal Stormwater Permit). Postconstruction BMPs would consider factors such as permanent stabilization of disturbed soil and natural stormwater quality treatment and would include LID, hydromodification measures, and erosion control/revegetation efforts. A statewide permit establishes requirements to substantially reduce or eliminate the discharge of pollutants from Caltrans right-of-way to storm drain systems and receiving waters.

Compliance with applicable regulatory requirements including the Construction General Permit, Caltrans Statewide Storm Water Program and Management Plan, and Municipal Stormwater Permit outlined above and in Section 4.10.2, "Regulatory Setting," would require that predevelopment hydrology be maintained after construction and treatment of runoff to substantially reduce or eliminate the discharge of pollutants to storm drain systems and receiving waters. For projects that discharge to 303(d)-listed impaired water bodies, BMPs would be required that target the removal of the pollutants causing the impairment. Transportation network improvements and programs associated with the proposed Plan would not substantially degrade water quality in violation of applicable water quality standards or WDRs or conflict with a water quality control plan or its implementation. This impact is therefore less than significant.

2035 Conclusion

Implementation of regional growth and land use changes and transportation network improvements associated with the proposed Plan would not substantially degrade water quality in violation of existing standards and WDRs conflict with a water quality control plan or its implementation, or provide substantial sources of polluted runoff because compliance with detailed existing and evolving regulatory requirements would substantially lessen or eliminate the discharge of pollutants into receiving waters, including 303(d)-listed waters, during construction and operations. Therefore, this impact (HWQ-1) in the year 2035 is less than significant.

2050

Regional Growth and Land Use Change

As discussed in the 2035 analysis, construction associated with regional growth and land use change under the proposed Plan would generate pollutants. Construction-related earth-disturbing activities would result in short-term water quality impacts associated with soil erosion and subsequent sediment transport to adjacent properties or watercourses via storm drains. Development under the proposed Plan would also increase the amount of impervious surface area in the region, such as new building rooftops and paved areas. The new impervious surface areas would collect common urban pollutants, such as sediment, oil and grease, metals, nutrients, and trash and debris. Development under the proposed Plan would also increase the amount of managed landscaping areas in the region that would provide a source of nutrients, weed abatement herbicides, and irrigation runoff.

Most development by 2050 would consist of infill development and redevelopment in existing urban and suburban communities that are already highly developed with impervious surfaces. As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. Infill and redevelopment would incrementally increase the amount of impervious surface area in existing urban and suburban communities. Conversely, the limited development forecasted on vacant land, open space, and agricultural land would cause greater increases in impervious surfaces (and polluted runoff) than infill and redevelopment.

Increases in the amount of impervious surfaces and landscaped areas would generally result in the accumulation, exposure, and transport of additional pollutants. Runoff during storm events and non-stormwater flows would transport pollutants via storm drain systems and could adversely affect surface water and groundwater quality if not properly managed. Several creeks and coastal lagoons have existing water quality impairments; therefore, any

increase in pollutant concentrations from new development could impact water quality, particularly for waterbodies listed as impaired under CWA Section 303(d). However, pollutant types and concentrations in runoff would depend on numerous site and location-specific factors, as described in the 2035 analysis.

Compliance with regional, state, and federal water quality regulations would ensure that the increased runoff volume and pollutant generation from development are addressed. Development associated with forecasted regional growth and land use change under the proposed Plan would be subject to regulatory requirements that substantially reduce surface water quality impacts during construction and postconstruction. Construction BMPs that reduce erosion and subsequent sediment transport, such as silt fences, fiber rolls, sandbags, gravel bag berm, and drainage inlet protection, would be implemented during construction activities in compliance with the SWPPP and Construction General Permit. Implementation of BMPs would also ensure that water quality standards would be achieved, including the WQOs that protect designated beneficial uses of surface and groundwater, as defined in the Basin Plan.

During operations and maintenance of development projects, postconstruction practices would be implemented and maintained to substantially reduce stormwater pollution and prevent substantial water quality degradation as required by applicable regulations including the Municipal Stormwater Permit. Postconstruction BMPs are listed in the 2035 analysis.

As discussed in the 2035 analysis, regional growth and land use change associated with the proposed Plan would also contribute additional demand for wastewater treatment, which would increase wastewater discharges (i.e., residential, commercial, and industrial) from regional wastewater treatment plants (e.g., Point Loma WWTP and Ocean Outfall, North City WRP, and South Bay WRP). Treated wastewater from regional wastewater treatment plants is discharged to surface waters, including the Pacific Ocean. NPDES permits govern the discharge of water from wastewater treatment plants to surface waters. As discussed earlier, the recent NPDES permit renewal for the Point Loma WWTP under the proposed Pure Water San Diego concept specifies new and improved joint water/wastewater facilities that would divert approximately 83 mgd of wastewater from the plant's wastewater stream in the form of potable reuse water by the end of 2035 (City of San Diego 2022). Although the proposed Pure Water San Diego program calls for new potable water reclamation to reduce capacity concerns, smaller regional collection systems and treatment facilities in areas of increased growth would require expansion to ensure adequate capacity in 2050 (see Section 4.15) while also protecting surface, ground, and marine water resources (i.e., outfall discharge areas). Development in existing communities would require expansion or upsizing of existing collection and treatment systems, whereas development in new areas would require installation of new collection and treatment systems. These wastewater treatment facility/infrastructure expansion actions would be required to comply with evolving point-source-discharge NPDES permits, as well as applicable NPDES general permits and assorted local regulations to minimize impacts on receiving waters. Ongoing marine water quality monitoring programs would ensure water quality is not adversely impacted by wastewater discharges.

Compliance with applicable regulatory requirements outlined above including CWA implemented by Porter-Cologne Act, Water Code Section 13000 et seq.; NPDES regulations; the Municipal Permit; Construction General Permit, and in Section 4.10.2, "Regulatory Setting," would require that predevelopment hydrology be maintained after construction is completed; runoff would be treated to remove or substantially reduce pollutants before discharging to surface waters. For projects that discharge to 303(d)-listed impaired water bodies, mandatory BMPs would be implemented to substantially lessen the quantity of pollutants causing the impairment from leaving the site and entering the impaired water body. Wastewater discharges would be in compliance with applicable NPDES permit requirements. Therefore, regional growth and land use change associated with the proposed Plan would not substantially degrade water quality in violation of water quality standards or WDRs, conflict with a water quality control plan or its implementation. or provide substantial sources of polluted runoff. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. As described in the 2035 analysis, transportation infrastructure contributes to water

quality impacts during construction and operations. Construction activities associated with transportation network improvements would increase erosion and subsequent sediment transport to adjacent properties, roadways, or watercourses via storm drains. Construction activities could also generate pollutants that could contaminate runoff or receiving waters. In addition, bridge and roadway modifications across water courses would be required. Construction disturbances and dredging would have an adverse impact on turbidity, affecting receiving water quality, particularly receiving waters listed as impaired for sediment/siltation.

Transportation network improvements under the proposed Plan would also increase the amount of impervious surface area in the region, such as new paved areas. New impervious surfaces, including freeways, roadways, and parking lots, would convey common urban pollutants to landscaped areas. As described above, primary water pollutants associated with transportation infrastructure include oil and grease, metals, sediment, hydrocarbons, trash and debris, PAHs, heavy metals, and herbicides. Runoff would transport pollutants via local storm drain systems, and if not properly managed, pollutants could adversely affect surface water quality. In general, bicycle improvement projects would not collect the same type of pollutants as transportation facilities used by vehicles. Therefore, runoff from such improvements would not discharge vehicle-related pollutants into storm drains and receiving waters.

As shown in Table 4.10-2, several planned transportation network improvements by 2050, including the addition of Managed Lanes to Interstate (I) 5, I-15, I-805, State Route (SR) 15, SR 78, and SR 94, cross multiple 303(d)-listed water bodies. Most improvements would occur in areas that are already highly developed with impervious surfaces or are improvements to existing facilities such that transportation-related pollutants would discharge into storm drains and receiving waters which could degrade water quality in violation of water quality standards or WDRs, conflict with a water quality control plan or its implementation. or provide substantial sources of polluted runoff. Transportation network improvements by 2050 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, I-15, and I-805, which would also cross 303(d)-listed water bodies. Like the 2035 phase year, a number of active transportation improvements would be located on existing streets in urban areas and along rivers and creeks listed as impaired on the 303(d) list and transportation-related pollutants would discharge into storm drains and receiving waters which could degrade water quality in violation of water quality standards or WDRs, conflict with a water quality control plan or its implementation. or provide substantial sources of polluted runoff.

Compliance with applicable regulatory requirements described in the 2035 analysis and in Section 4.10.2, "Regulatory Setting," would require that predevelopment hydrology be maintained after construction and treatment of runoff to substantially reduce or eliminate the discharge of pollutants to storm drain systems and receiving waters. Although these regulations would evolve and change, compliance would ensure impacts on surface water are less than significant as each project is designed, analyzed, and permitted for construction. For projects that discharge to 303(d)-listed impaired water bodies, BMPs would be required that target the removal of the pollutants causing the impairment. Implementation of BMPs would also ensure that water quality standards would be achieved, including the WQOs that protect designated beneficial uses of surface and groundwater, as defined in the Basin Plan. Transportation network improvements and programs associated with the proposed Plan would not substantially degrade water quality in violation of applicable water quality standards or WDRs, conflict with a water quality control plan or its implementation, or provide substantial sources of polluted runoff. This impact is therefore less than significant.

Table 4.10-2 Planned Transportation Network Improvements Crossing 303(d)-Listed Water Bodies by 2050

Improvement Type	Project Name	Impaired Waterbody	Hydrologic Unit #

2050 Conclusion

Implementation of regional growth and land use changes and transportation network improvements associated with the proposed Plan would not substantially degrade water quality in violation of existing standards and WDRs, conflict with a water quality control plan or its implementation, or provide substantial sources of polluted runoff because compliance with detailed existing and evolving regulatory requirements would substantially lessen or eliminate the discharge of pollutants into receiving waters, including 303(d)-listed waters, during construction and operations. Therefore, this impact (HWQ-1) in the year 2050 is less than significant.

MITIGATION MEASURES

No mitigation measures are required for this impact.

HWQ-2 SUBSTANTIALLY ALTER THE EXISTING DRAINAGE PATTERN OF AN AREA, INCLUDING THROUGH THE ALTERATION OF THE COURSE OF A STREAM OR RIVER OR THROUGH THE ADDITION OF IMPERVIOUS SURFACES, IN A MANNER WHICH WOULD RESULT IN SUBSTANTIAL EROSION OR SILTATION ON OR OFF SITE.

Analysis Methodology

Evaluation of potential impacts associated with changes to the existing drainage pattern is based on a review of the proposed Plan in the context of state regulations, such as the Construction General Permit, and local regulations, such as general plans. The analysis examines how implementation of the proposed Plan, including components of the Sustainable Community Strategy (SCS) land use pattern and planned transportation improvements, such as increased impervious surfaces and construction activities associated with future development that would accommodate regional growth, may affect existing hydrology. The implementation of land use changes leading to future development and transportation network improvement projects under the proposed Plan would alter existing topography and drainage patterns and could increase stormwater runoff volume and rates as a result of increased impervious area. Implementation of the proposed Plan would have a significant impact related to alteration of existing drainage patterns if implementation were to substantially increase erosion or siltation on or off site.

Impact Analysis

2035

Regional Growth and Land Use Change

Regional growth and land use change associated with the proposed Plan could alter existing topography, change drainage patterns, increase impervious surface area, add pollutant sources, and reduce natural (i.e., undeveloped) landscape.

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the

region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Most development between 2022 and 2035 would consist of infill development and redevelopment in existing urban and suburban communities that are already highly developed with impervious surfaces. Redevelopment of existing areas or new development would likely require grading or earthwork and alter existing topography, which may increase the propensity for soils to become unstable and cause erosion or siltation on or off future development sites. Infill and redevelopment would incrementally increase the amount of impervious surface area in existing urban and suburban communities. However, development forecasted on vacant land, open space, and agricultural land, mainly in rural areas in San Diego County, would cause greater increases in impervious surfaces than infill and redevelopment, resulting in alterations to existing topography and drainage patterns. Forecasted regional growth and land use change in the coastal areas of the region, including parts of the city of San Diego, would be located on soils that are unstable or that may become unstable, making them more susceptible to erosion as a result of the development. Forecasted regional growth and land use change in the desert portion of the region, including parts of San Diego County and extending into Imperial and Riverside Counties, would be located on undeveloped land with soils susceptible to erosion as a result of the development. In addition, development under the proposed Plan would occur on or adjacent to steep slopes, which would increase erosion and sediment discharge if disturbed slopes are unstable.

Such changes would be closely regulated by the federal, state, and local laws described earlier, including Section 402 of the CWA, the Construction General Permit, and the Municipal Permit. Impacts resulting from construction would be primarily addressed through compliance with the Construction General Permit as discussed in Impact HWQ-1. A SWPPP would be implemented for any ground disturbance greater than 1 acre and would identify the sources of pollutants that may affect the quality of stormwater and would include construction BMPs to control erosion and minimize pollutants (e.g., sedimentation/siltation) in runoff.

Related to alterations to existing topography, development associated with the proposed Plan would be required to adhere to existing laws and regulations, including the design standards described in the CBC and all standard design, grading, and construction practices to avoid or reduce erosion or siltation. Specifically, the CBC addresses the design and construction of excavations, foundations, and other building elements to mitigate adverse soil conditions by requiring structures and buildings are built to withstand potential hazards associated with unstable or problematic soils. Compliance with the CBC would minimize risks associated with locating future development on unstable geologic units or soils. See Section 4.7.2 for a description of applicable CBC requirements. Further, site-specific analyses would be required for future development as a result of regional growth. Corrective measures, such as structural reinforcement and using engineered fill to replace unstable and expansive soils, would be applied to the design of individual future projects. All site designs would be reviewed and approved by the appropriate agencies.

During operations and maintenance, development projects would maintain predevelopment hydrology in compliance with current hydromodification requirements of the Municipal Permit. Although these regulations would evolve over time, their intent would remain in effect and serve to mitigate or otherwise control increased stormwater flows and erosion in an effort to maintain predevelopment hydrology. Therefore, any additional runoff volumes and peak flow discharges from impervious areas, such as new building rooftops and paved areas, must be attenuated such that drainage or conveyance capacities are not adversely impacted. As a result, runoff for postconstruction operations would be required to be mitigated and treated through LID, on site design, or off site structural BMPs. Detailed hydrologic and hydraulic calculations for proposed stormwater treatment measures, such as storm drains and for sizing of rock riprap energy dissipaters at storm drains to reduce storm runoff to non-erosive velocities, would be required to comply with the Municipal Permit. LID and incorporation of natural spaces, such as detention basins, infiltration strips, and porous paving, that reduce, infiltrate, and manage stormwater runoff flows would be required for all new developments. These measures would be required to be properly sized and engineered to substantially lessen runoff from development, thereby avoiding substantial erosion or siltation on or off site.

By incorporating these prescriptive design standards (in compliance with regulatory requirements) into development projects associated with regional growth and land use change, surface runoff patterns and erosive flows would be controlled. Through the Municipal Permit requirements to incorporate hydromodification measures, the regional growth and land use changes would maintain predevelopment hydrology. Therefore, development associated with regional growth and land use change would not substantially alter existing drainage patterns such that erosion or siltation on or off site would increase by 2035. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

The proposed transportation network improvements (e.g., highway, arterial, transit, and bicycle) would result in alterations to existing topography and drainage patterns without the incorporation of the appropriate BMPs. By 2035, additional transportation network improvements and programs would be developed, including new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes improvements to rural intersections and interchanges on SR 67, SR 76, and SR 94, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico Border, as well as tolling equipment and regional border management system investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. Some of these improvements and programs may involve major grading or earthwork resulting in alterations to existing topography and temporary changes to existing drainage patterns during construction. Grading and recontouring would be dependent on project alignments, existing topography, and the size/extent of runoff conveyance systems. Although most of the transportation network improvements would occur in already urbanized areas, some improvements, mainly in San Diego County, would occur on vacant land and would cross natural drainage areas. Impacts on both upstream and downstream resources result from increases in impervious areas and the construction of bridge pilings which can alter streams, rivers, and floodways. The introduction of new or expanded bridge pilings can cause scouring and changes in the transportation and deposition of sediment both upstream and downstream. Impervious areas increase stormwater flow volume or velocity, thereby increasing scouring and erosion in channels. As with regional growth and land use changes, the transportation network improvements in place by 2025 that are located in, on, or near hills; coastal areas; canyons; and other places with steep slopes or unstable soils, including parts of the city of San Diego, would increase the potential for erosion.

Caltrans policies related to flooding, require that engineered conveyances (whether hardscaped or soft bottom) integrate energy dissipation protection, streambank erosion protection, bridge pier scour protection, and other suitable design controls to eliminate or substantially reduce erosion and transport of sediment or silt to downstream areas. By incorporating these standard engineering practices and complying with regulatory requirements, such as the Municipal Permit, Construction General Permit, Municipal Stormwater Permit, and the Caltrans NPDES permit, on and off site erosion would be avoided or substantially reduced.

In areas with highly erosive soils, additional site design controls would be used to ensure stabilization under a variety of storm intensities. By incorporating these types of prescriptive design standards in compliance with regulatory requirements such as the Construction General Permit and Industrial General Permit, surface runoff patterns, and erosive flows associated with transportation network improvements would be controlled. Through

the various hydromodification requirements that would be in place, the transportation network improvements would maintain predevelopment hydrology. Therefore, transportation network improvements associated with the proposed Plan would not substantially alter existing drainage patterns such that erosion or siltation would increase by 2035. This impact is less than significant.

2035 Conclusion

Compliance with regulatory requirements and implementation of similar design measures described above and in Section 4.10.2, "Regulatory Setting," would ensure that regional growth and land use changes as well as transportation network improvements associated with the proposed Plan would not substantially alter existing drainage patterns such that erosion or siltation would increase. Through the various requirements to incorporate hydromodification and LID measures, the proposed Plan would maintain predevelopment hydrology, and would reduce, infiltrate, and properly manage stormwater runoff such that alterations to the existing drainage pattern of an area, would not result in substantial erosion or siltation on or off site. Therefore, this impact (HWQ-2) in the year 2035 is less than significant.

2050

Regional Growth and Land Use Change

Similar to the 2035 analysis, regional growth and development associated with the proposed Plan could alter existing topography, change drainage patterns, increase impervious surface area, add pollutant sources, and reduce natural, undeveloped landscape. Most development by 2050 would consist of infill development and redevelopment in existing urban and suburban communities that are already highly developed with impervious surfaces. Redevelopment of existing areas or new development would likely require grading or earthwork and alter existing topography, which may increase the propensity for soils to become unstable and cause erosion or siltation on or off future development sites. As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. Infill and redevelopment would incrementally increase the amount of impervious surface area in existing urban and suburban communities. Conversely, development forecasted on vacant land, open space, and agricultural land, mainly in San Diego County, would cause greater increases in impervious surfaces than infill and redevelopment. Forecasted regional growth and land use change in the coastal areas of the region or near areas with canyons and hills, including parts of the city of San Diego, would result in alterations to existing topography and increase erosion and sediment discharge if disturbed slopes are unstable. However, Plan-related projects would need to comply with a variety of regulatory requirements for controlling erosion, and siltation, as well as design standards and other applicable regulations such as the Construction General Permit, and the Municipal Permit to reduce impacts. development associated with the proposed Plan would be required to adhere to existing laws and regulations, including the design standards described in the CBC and all standard design, grading, and construction practices to avoid or reduce erosion or siltation. Specifically, the CBC addresses the design and construction of excavations, foundations, and other building elements to mitigate adverse soil conditions by requiring structures and buildings are built to withstand potential hazards associated with unstable or problematic soils. Compliance with the CBC would minimize risks associated with locating future development on unstable geologic units or soils. See Section 4.7.2 for a description of applicable CBC requirements. Further, site-specific analyses would be required for future development as a result of regional growth. Corrective measures, such as structural reinforcement and using engineered fill to replace unstable and expansive soils, would be applied to the design of individual future projects. All site designs would be reviewed and approved by the appropriate agencies. Construction impacts would generally be addressed through compliance with the Construction General Permit. For projects disturbing more than 1 acre, a SWPPP and associated BMPs would be implemented to control and minimize runoff.

Operations and maintenance for development projects would be required to comply with hydromodification management requirements identified in the Municipal Permit, which requires the implementation of hydrologic control measures so that post project runoff flow rates and durations do not exceed predevelopment flow rates and durations. Further, the Municipal Permit would require LID, on site design, or off site structural BMPs for future development. These measures would substantially reduce runoff rates and volumes such that impacts associated with erosion would be avoided or minimized.

By incorporating design standards in compliance with regulatory requirements into development projects accommodating regional growth, surface runoff patterns and erosive flows would be controlled. Through the Municipal Permit requirements to incorporate hydromodification measures, future development that would accommodate regional growth would maintain predevelopment hydrology. Therefore, development associated with regional growth and land use change would not substantially alter existing drainage patterns such that erosion and siltation would increase by 2050. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to the 2035 analysis, the proposed transportation network improvements by 2050 would result in alterations to existing topography and drainage patterns without the incorporation of the appropriate BMPs. Transportation facilities that would alter existing drainage patterns include improvements near the coast and improvements to highways that would involve grading. Although most of the transportation network improvements would occur in already urbanized areas, some improvements, mainly in San Diego County, would occur on vacant land, increasing impervious surface areas, stormwater flow volume or velocity, and scouring and erosion in channels. Similar to the 2035 analysis, transportation network improvements would occur in areas with unstable soils, particularly improvements located in hilly or coastal areas such as the Coastal Rail Trail improvements, making these areas more susceptible to erosion. Transportation network improvements in place by 2050 are shown in Figures 2-7 and 2-8. Transportation network improvements and programs proposed under the proposed Plan would be required to conform to and comply with the water quality protection regulations discussed above and, as such, would employ necessary erosion protection and siltation control into their respective designs. Changes to surface runoff patterns, drainage patterns, and flows would be substantially less as a result.

Required design standards (e.g., municipal HMPs, Caltrans, FHWA, and FTA standards) would be implemented to eliminate or substantially reduce increased risk of erosion and siltation. By incorporating design standards in compliance with regulatory requirements, surface runoff patterns, and erosive flows associated with transportation network improvements would be controlled. Through the various hydromodification requirements that would be in place, the transportation network improvements would maintain predevelopment hydrology. Therefore, transportation network improvements associated with the proposed Plan would not substantially alter existing drainage patterns such that erosion and siltation would increase by 2050. This impact is less than significant.

2050 Conclusion

Compliance with regulatory requirements and implementation of similar design measures described above and in Section 4.10.2, "Regulatory Setting," would ensure that regional growth and land use changes as well as transportation network improvements associated with the proposed Plan would not substantially alter existing drainage patterns such that erosion and siltation would increase. Through the various requirements to incorporate hydromodification and LID measures, the proposed Plan would maintain predevelopment hydrology, and would reduce, infiltrate, and properly manage stormwater runoff such that alterations to the existing drainage pattern of an area, would not result in substantial erosion or siltation on or off site. Therefore, this impact (HWQ-2) in the year 2050 is less than significant.

MITIGATION MEASURES

No mitigation measures are required for this impact.

HWQ-3 SUBSTANTIALLY ALTER THE EXISTING DRAINAGE PATTERN OF AN AREA, INCLUDING THROUGH THE ALTERATION OF THE COURSE OF A STREAM OR RIVER OR THROUGH THE ADDITION OF IMPERVIOUS SURFACES, IN A MANNER WHICH WOULD (I) SUBSTANTIALLY INCREASE THE RATE OR AMOUNT OF SURFACE RUNOFF IN A MANNER WHICH WOULD RESULT IN FLOODING ON- OR OFF-SITE OR (II) IMPEDE OR REDIRECT FLOOD FLOWS.

Analysis Methodology

Evaluation of potential impacts associated with changes to the existing drainage pattern potential and flooding impacts is based on a review of the proposed Plan in the context of federal regulations such as FEMA's NFIP; and local regulations such as general plans and the County's Multi-Jurisdictional Hazard Mitigation Plan, and local flood control and stormwater management practices. The analysis examines how implementation of the proposed Plan, including components of the SCS land use pattern and planned transportation improvements, such as increased impervious surfaces, and construction activities, may alter existing drainage patterns that could lead to flooding or impede or redirect flood flows.

Future development associated with the implementation of the SCS land use pattern and transportation network improvement projects under the proposed Plan would alter existing topography and drainage patterns and could increase stormwater runoff volume and rates due to increased impervious area. Land use development generally alters drainage patterns by redistributing runoff that is discharging to waterbodies (hydromodification), whereas linear transportation projects can result in direct modifications to waterbodies through new and modified water crossing structures (e.g., bridges and culverts). Therefore, hydromodification and increased flood risks from modified water crossings or impeded or redirected flood flows under the proposed Plan are qualitatively evaluated in the analysis below. A qualitative analysis of the proposed Plan's ability to maintain predevelopment hydrology, properly minimize and treat project runoff, and incorporate LID site design is provided, and any resulting potential impacts associated with flooding are analyzed. Implementation of the proposed Plan would have a significant impact related to the existing drainage pattern if it were to substantially increase flooding on or off site or cause the impediment or redirection of flood flows. The analysis is based on the most current data and planning tools, including data from FEMA's FIRMs that delineate 100-year flood hazard areas to assist local governments with the land use planning and floodplain management decisions, in accordance with the National Flood Insurance Act, and the County of San Diego's 100-year flood hazard mapping identified in the Multi-Jurisdictional Hazard Mitigation Plan.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. The regional growth pattern in 2035 would result in development within 100-year and 500-year flood hazard zones (see Figure 4.10-3). FEMA prepares FIRMs that delineate floodplains in geographic areas across the nation to assist with appropriate land use planning and floodplain management decisions needed to meet the requirements of the NFIP. In general, the NFIP mandates that development is not to proceed within the 100-year floodplain if development is expected to increase flood

elevation by 1 foot or more. The County of San Diego FMP identifies actions and recommendations for flood risk reduction (County of San Diego 2007). Development that would accommodate growth under the proposed Plan is required to align with the County's hazard MAP as part of compliance with the County of San Diego FMP (County of San Diego 2007). Designing regional growth land use projects to comply with County and city general plan safety elements and flood ordinances would further ensure that development associated with the proposed Plan would be built to minimize flood risk.

As discussed in Impact HWQ-2, development that would accommodate regional growth and land use patterns associated with the proposed Plan would change drainage patterns, increase impervious surface area, and reduce natural (i.e., undeveloped) landscape. Development forecasted on vacant land, open space, and agricultural land, mainly in rural areas in San Diego County, would cause greater increases in impervious surfaces than infill and redevelopment, resulting in alterations to existing drainage patterns, an increase in potential for flooding, and impeded or redirected flood flows.

Potential flooding impacts resulting from construction would be primarily addressed through compliance with the Construction General Permit and the requirement to develop a SWPPP, as discussed in Impact HWQ-1. These regulations would require the implementation of BMPs during construction to minimize runoff from the construction site and reduce the potential for any on or off site flooding. During operations and maintenance, development projects would ensure predevelopment hydrology is maintained in compliance with current hydromodification requirements of the Municipal Permit, as discussed in Impact HWQ-2. Runoff from post construction operations for all new developments would be required to be mitigated and treated through LID, on site design, or off site structural BMPs. LID and incorporation of natural spaces, such as detention basins, infiltration strips, and porous paving that reduce, infiltrate, and manage stormwater runoff flows. These measures would be required to be properly sized and engineered to substantially lessen runoff from development, thereby avoiding adverse hydromodification and flooding impacts. In addition, the contractor would comply with the minimum construction BMPs identified in the regional MS4 permit and implement construction BMPs to manage stormwater run-on and runoff from individual construction sites. Therefore, the proposed Plan would not result in construction impacts that could increase the rate or amount of surface runoff in a manner which would result in flooding on or off site or impede or redirect flood flows by 2035.

To address the alteration of drainage patterns that could affect existing flood risk, compliance with the NPDES MS4 Phase I and Phase II permits requires agencies to implement stormwater management plans. Stormwater management plans require the implementation of site design control measures, which can include conserving natural areas, protecting slopes and channels, minimizing impervious surfaces, the use of vegetated swales and buffers, grass median strips, detention basins, ponds or constructed wetlands, infiltration basins, settlement ponds, or other LID practices and drainage control features such as rain gardens, vegetated rooftops, rain barrels, and permeable pavement. These design practices would help to maximize on site infiltration of runoff, preserve natural drainage flow where appropriate, and control stormwater drainage and runoff flow to minimize potential drainage impacts affecting existing flood risk. Although future development could result in an increased volume of surface water runoff from new impervious surfaces compared to existing conditions, compliance with local, state, and federal regulations would be effective in minimizing impacts related to alteration of drainage.

Land use patterns by 2035 under the proposed Plan to accommodate regional growth would be concentrated in built-out areas where drainage infrastructure already exists. In these areas, increasing intensification of land uses would either be accommodated by existing drainage infrastructure or project applicants would be required to construct infrastructure improvements in accordance with local ordinances within the plan area. Development that would occur in undeveloped and/or vacant areas with no previous infrastructure would be required to comply with NPDES permits, depending on project size; site design control measures and LID practices to address flooding; and local ordinances and regulations regarding on site drainage, stormwater management, and runoff. Compliance with applicable regulations would ensure that drainage would not be altered such that any changes to existing drainage patterns would not increase the rate or amount of surface runoff in a manner which would result in flooding on or off site or impede or redirect flood flows.

By incorporating these prescriptive design standards in compliance with regulatory requirements into development projects associated with regional growth and land use change, surface runoff volumes and flooding would be controlled. Through the requirements to incorporate hydromodification measures as required by the Municipal Permit, the regional growth and land use changes would maintain predevelopment hydrology and would not substantially increase the rate or amount of, or impede or redirect, flood flows. Therefore, development associated with regional growth and land use change would not substantially alter existing drainage patterns such that flooding on or off site would increase by 2035. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

As discussed in Impact HWQ-2, transportation network improvements (e.g., highway, arterial, transit, and bicycle) would result in alterations to drainage patterns without the incorporation of the appropriate BMPs. Some of these improvements and programs may involve major grading or earthwork, resulting in temporary changes to existing drainage patterns during construction. Grading and recontouring would be dependent on project alignments, existing topography, and the size/extent of runoff conveyance systems. Although most of the transportation network improvements would occur in already urbanized areas, some improvements, mainly in San Diego County, would occur on vacant land and would cross natural drainage areas. Impacts on both upstream and downstream resources result from alterations to streams, rivers, and floodways, such as increases in impervious areas and the construction of bridge pilings. Impervious areas increase stormwater flow volume or velocity, thereby increasing the risk of flooding. However, no other structures apart from bridge pilings associated with transportation network improvements are anticipated to be added that could redirect or exacerbate existing flood flows. In addition, the contractor would comply with the minimum construction BMPs identified in the regional MS4 permit and implement construction BMPs to manage stormwater run-on and runoff from individual construction sites. Therefore, transportation network improvements would not result in impacts associated with impeding or redirecting flood flows.

Current design practices are employed in accordance with local HMPs prepared with the purpose of managing increases in runoff discharge rates and durations from specific projects, where such increased rates and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.

Engineering standards exist for properly controlling and conveying surface runoff and surface waters when drainage modifications are necessary for project implementation. Caltrans' drainage designs would conform to the Highway Design Manual (Caltrans 2019), which requires the following design flood criteria:

- Roadway storm drain system and the freeway shoulder must be able to safely drain the 25-year return interval storm.
- Culverts must be designed to convey the 10-year interval storm (without causing the headwater elevation to rise above the inlet top of the culvert) and convey the 100-year interval storm without headwaters rising above an elevation that would cause objectionable backwater depths or outlet velocities.

The County of San Diego requires transportation projects in unincorporated areas to be designed to convey 50-year storm peak runoff volumes within the project drainage system and to be capable of conveying 100-year floodwaters without exceeding curb height or damaging structures along the right-of-way (County of San Diego

2014b). In addition, HMP regulations, as well as the Municipal Permit, require that PDPs maintain predevelopment hydrology. As a result, additional runoff volumes and peak flow discharges from impervious areas, such as freeways, must be attenuated to maintain hydrological conditions and not exceed stormwater conveyance capacities. LID is commonly applied to achieve this requirement. By incorporating these types of prescriptive design standards in compliance with regulatory requirements, surface runoff patterns and flooding associated with transportation network improvements would be controlled. Through the various hydromodification requirements that would be in place, the transportation network improvements would maintain predevelopment hydrology. Therefore, transportation network improvements associated with the proposed Plan would not substantially alter existing drainage patterns or impede or redirect flood flows such that flood risk would increase by 2035. This impact is less than significant.

2035 Conclusion

Compliance with regulatory requirements and implementation of similar design measures, as described above and in Section 4.10.2, "Regulatory Setting," would ensure that regional growth and land use changes, as well as transportation network improvements associated with the proposed Plan would not substantially alter existing drainage patterns or increase the rate or amount of, or impede or redirect flood flows such that flood risk would increase. Through the various requirements to incorporate hydromodification and LID measures, the proposed Plan would maintain predevelopment hydrology and would reduce, infiltrate, and properly manage stormwater runoff. Therefore, this impact (HWQ-3) in the year 2035 is less than significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. Similar to the 2035 analysis, the land use pattern in 2050 would result in development within 100-year and 500-year flood hazard zones (see Figure 4.10-3). Designing regional growth and land use projects to comply with NFIP mandates, the County of San Diego FMP, and County and city general plan safety elements and flood ordinances would minimize flood risk to future development. Compliance with individual requirements or regulatory oversight, approval, or involvement from municipal and county flood control management agencies would further reduce the risk of pollutant release due to project site inundation by restricting uses that are dangerous to health, safety, and property due to erosion or water hazards; require uses vulnerable to floods to be protected from flood damage at the time of construction; control the alteration of natural floodplains; control filling, grading, or dredging that may increase flood damage; and prevent construction of flood barriers that divert flood waters or increase flood hazards in other areas. As described above, the NFIP mandates that development is not to proceed within the 100-year floodplain if development is expected to increase flood elevation by 1 foot or more, which would prohibit new development in areas subject to flooding which could increase the risk of pollutant release due to inundation.

Similar to the 2035 analysis and as discussed in Impact HWQ-2, development that would accommodate regional growth and land use patterns associated with the proposed Plan would change drainage patterns, increase impervious surface area, and reduce natural, undeveloped landscape. Plan-related projects would need to comply with a variety of regulatory requirements for controlling floodwater, as well as design standards and other applicable regulations to reduce flooding impacts. Construction-related flooding impacts would generally be addressed through compliance with the Construction General Permit. For projects disturbing more than 1 acre, a SWPPP and associated BMPs would be implemented to control and minimize runoff, thereby reducing the potential for on or off site flooding or impeded or redirected flood flows.

Operations and maintenance for development projects would be required to maintain predevelopment hydrology in compliance with enforced hydromodification requirements, similar to requirements in the Municipal Permit, which would require LID, on site design, or off site structural BMPs. Through the requirements to incorporate hydromodification measures, the regional growth and land use changes would maintain predevelopment hydrology. Therefore, development associated with regional growth and land use change would not substantially alter existing drainage patterns, or increase the rate or amount of surface runoff in a manner which would result in flooding on or off site or impede or redirect flood flows by 2050. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to the 2035 analysis and as discussed in Impact HWQ-2, the proposed transportation network improvements by 2050, including the addition of Managed Lanes to Interstate (I) 5, I-15, I-805, State Route (SR) 15, SR 78, and SR 94 would increase impervious surface which could result in alterations to drainage patterns without the incorporation of the appropriate BMPs. Transportation network improvements and programs proposed under the proposed Plan would be required to conform to and comply with water quality protection regulations and, as such, would employ necessary flood control measures into their respective designs. Changes to surface runoff patterns, drainage patterns, and flows would be substantially less as a result. No structures apart from bridge pilings associated with transportation network improvements are anticipated to be added that could redirect or exacerbate existing flood flows. Required design practices (e.g., municipal HMPs, Caltrans standards, FHWA and FTA policies) would be implemented to eliminate or substantially reduce risk of flooding.

By incorporating design standards in compliance with regulatory requirements, surface runoff patterns and flooding associated with transportation network improvements would be controlled. Through the various hydromodification requirements that would be in place, the transportation network improvements would maintain predevelopment hydrology. Therefore, transportation network improvements associated with the proposed Plan would not substantially alter existing drainage patterns, or substantially increase the rate or amount of, or impede or redirect flood flows such that flood risk would increase by 2050. This impact is less than significant.

2050 Conclusion

Compliance with regulatory requirements and implementation of similar design measures, as described above and in Section 4.10.2, "Regulatory Setting," would ensure that regional growth and land use changes, as well as transportation network improvements, associated with the proposed Plan would not substantially alter existing drainage patterns or substantially increase the rate or amount of, impede, or redirect flood flows such that flood risk would increase. Through the various requirements to incorporate hydromodification and LID measures, the proposed Plan would maintain predevelopment hydrology and would reduce, infiltrate, and properly manage stormwater runoff such that on or off site flooding would not occur. Therefore, this impact (HWQ-3) in the year 2050 is less than significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change and transportation network improvements would result in alterations to drainage patterns. However, development and transportation projects as described in the proposed Plan are required to comply with existing and evolving regulatory requirements that control surface runoff patterns and floodwater, as well as design standards (e.g., SWPPP, hydromodification, and LID measures) and other applicable regulations to reduce impacts. The proposed Plan's drainage impacts would be worsened by climate change; however, regularly updated flood mapping, regulations (e.g., NPDES), and design standards are increasingly stringent and are expected to mitigate runoff.

MITIGATION MEASURES

No mitigation measures are required for this impact.

HWQ-4 SUBSTANTIALLY INCREASE RISK OF POLLUTANT RELEASE DUE TO INUNDATION OF A FLOOD HAZARD, TSUNAMI, OR SEICHE ZONE.

Analysis Methodology

This section analyzes whether areas where growth would occur and land use change and transportation network improvements that occur near the San Diego region's coastline would be subjected to hazards resulting from flooding, tsunamis, or seiches. In addition, this section analyzes whether inland areas where growth would occur and land use change and transportation network improvements that occur near surface water resources, such as streams and rivers, would be subject to flooding. Flooding, tsunami, and seiche hazard areas identified in local general plans or other data sources are referenced to determine whether any forecasted regional growth and land use change or planned transportation network improvements or programs under the proposed Plan would occur in the hazard areas identified.

Hazard areas associated with seiches include large enclosed or partially enclosed water bodies, such as reservoirs, coastal bays, and lakes. Tsunami hazard areas occur along the coastline; however, some areas are protected by the coastal formations and offshore islands. In addition, surface water streams and rivers are also subject to flooding and inundation. Where land use changes or planned transportation network improvements may occur in flood, tsunami or seiche zones, appropriate precautions, design standards, and other methods to protect the public and structures are referenced and discussed. Implementation of the proposed Plan would have a significant impact related to flooding, tsunami, and seiche hazard areas if forecasted regional growth and land use change or planned transportation network improvements under the proposed Plan would occur in areas with the potential for flooding or inundation conditions, resulting in an increased risk of pollutants being released due to inundation.

Seiches and tsunamis are rare events that are typically caused by geologic factors such as earthquakes. A new project that might result in the risk of pollutant release due to inundation would likely be limited to an industrial project that uses significant amounts of chemicals in industrial processes or stores chemical outdoors that could be washed away in the event of flooding from tsunami or seiche. This section evaluates the potential for future development that would accommodate regional growth that could be inundated by flooding and pose a risk of release of pollutants.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, approximately 93.3% of the forecasted regional population increase between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Development with project footprints that lie in low elevations directly adjacent to the coast would be susceptible to tsunami, including coastal areas in the cities of San Diego and Chula Vista. Tsunami inundation areas occur along the entire coastline from the California-Mexico border to north of Oceanside (California Department of Conservation 2025). However, as described in Section 4.10.1, "Existing Conditions," the risk of tsunamis in the San Diego region is low. In 92 years of record, 19 measurable tsunamis have been recorded in the San Diego region, with most only a few tenths of a meter high (Agnew 1979). There is no historical precedent for large damaging seiches in the San Diego region; therefore, the risk of seiches affecting development associated with regional growth would be expected to be low.

Although the risk of tsunami and seiche and the associated risk of pollution release are considered low in the San Diego region, development under the proposed Plan would occur in areas subject to these hazards. Regional growth in 2035 would result in development within 100-year and 500-year flood hazard zones (see Figure 4.10-3). Designing regional growth and land use projects to comply with NFIP mandates, the County of San Diego FMP, and County and City general plan safety elements and flood ordinances would minimize flood risk to development associated

with the proposed Plan. As described above, the NFIP mandates that development is not to proceed within the 100-year floodplain if development is expected to increase flood elevation by 1 foot or more, which would prohibit new development in areas subject to flooding which could increase the risk of pollutant release due to inundation.

Development projects associated with regional growth in the Plan area would also be subject to the requirements of applicable municipal and county flood control management regulations and plans such as the County of San Diego FMP, and local floodplain management ordinances (e.g., the County of San Diego Flood Damage Prevention Ordinance, the City of San Diego floodplain ordinance [Chapter 14, Article 3, Division 1]). Compliance with individual requirements or regulatory oversight, approval, or involvement from municipal and county flood control management agencies would further reduce the risk of pollutant release due to project site inundation by restricting uses that are dangerous to health, safety, and property due to erosion or water hazards; require uses vulnerable to floods to be protected from flood damage at the time of construction; control the alteration of natural floodplains; control filling, grading, or dredging that may increase flood damage; and prevent construction of flood barriers that divert flood waters or increase flood hazards in other areas.

The risk of release of pollutants is related to local seismic conditions and potential flooding that could occur. As described in Section 4.9, "Hazards and Hazardous Materials," development that occurs in the Plan area could include a range of type and intensity of pollutants during construction and operation. The use and storage of these pollutants is regulated to minimize the potential for accidental release. State and local regulations are also in place that require flood protection. Prior to flood events, measures such as sandbag barriers and gravel bag berms would be implemented and maintained to reduce the risk of pollutant release. As a result, there is not a substantial risk of pollutant release due to project inundation.

Compliance with enforced planning and design standards, regulations, and safety ordinances would serve to address and minimize the release of pollutants due to inundation in a flood hazard, tsunami, or seiche zone. Planning and design of development projects would be required to comply with safety policies in the County of San Diego General Plan Safety Element to reduce the risk associated with flooding hazards, such as Policy S-9.3, which requires development within mapped flood hazard areas be sited and designed to minimize on and off-site hazards to health, safety, and property due to flooding, and Policy S-9.6, which prohibits development in dam inundation areas. State planning and zoning law requires that all city and county general plans contain a safety element that identifies and appraises hazards including the effects of seismically induced waves, such as tsunamis and seiches. The County of San Diego General Plan Safety Element policies S-9.3 and S-9.6 reduce the risk of flooding hazards by requiring development within mapped flood hazard areas to be sited and designed to minimize on and off-site hazards (County of San Diego 2011b).

The portions of the regional growth and land use development pattern associated with the proposed Plan that are located within the existing floodplains, including the cities of San Diego and Chula Vista and San Diego County, would be impacted by a 100-year flood if appropriate design measures are not incorporated. Table 4.10-3 shows the land use types in each municipality in the San Diego region that encroach upon the 100-year floodplain for 2035.

Table 4.10-3 2035 Land Use Types in the 100-Year Floodplain

Land Use Type	Municipality
Airstrip	County of San Diego
Arterial commercial	Carlsbad, Chula Vista, Coronado, El Cajon, Encinitas, Escondido, Imperial Beach, Lemon Grove, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee, Solana Beach, Vista
Automobile dealership	Chula Vista, El Cajon, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos
Bay or lagoon	Carlsbad, Chula Vista, Coronado, Del Mar, Encinitas, Imperial Beach, National City, Oceanside, County of San Diego, San Diego, Solana Beach
Beach—active	Carlsbad, Coronado, Encinitas, Oceanside, County of San Diego, San Diego
Beach—passive	Carlsbad, Coronado, Del Mar, Encinitas, Oceanside, County of San Diego, San Diego
Casino	County of San Diego

Land Use Type	Municipality
Cemetery	County of San Diego, San Diego
Commercial under construction	Encinitas, San Diego, Santee
Communications and utilities	Carlsbad, Chula Vista, Coronado, Del Mar, Escondido, National City, Oceanside, County of San Diego, San Diego, San Marcos, Vista
Community shopping center	Carlsbad, Chula Vista, El Cajon, Encinitas, Escondido, National City, Oceanside, County of San Diego, San Diego, San Marcos, Santee, Vista
Convention center	San Diego
Dormitory	San Diego
Elementary school	Chula Vista, Escondido, National City, Oceanside, Poway, County of San Diego, San Diego, Santee, Vista
Extractive industry	Chula Vista, Coronado, National City, Poway, County of San Diego, San Diego
Field crops	Carlsbad, Encinitas, Escondido, Oceanside, Poway, County of San Diego, San Diego, San Marcos
Fire or police station	Chula Vista, Escondido, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Vista
Freeway	Carlsbad, Chula Vista, El Cajon, Encinitas, Escondido, La Mesa, Lemon Grove, National City, Oceanside, County of San Diego, San Diego, San Marcos, Santee, Vista
General aviation airport	El Cajon, Oceanside, County of San Diego
Golf course	Carlsbad, Chula Vista, Coronado, Escondido, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee
Golf course clubhouse	Chula Vista, National City, County of San Diego, San Diego
Government office or civic center	Coronado, Poway, County of San Diego, San Diego
Group quarters	San Marcos
Heavy industry	San Diego
Hospital—general	San Diego
Hotel or motel (high rise)	San Diego
Hotel or motel (low rise)	Carlsbad, Chula Vista, Del Mar, El Cajon, La Mesa, National City, Oceanside, County of San Diego, San Diego, San Marcos
Industrial park	Carlsbad, Chula Vista, El Cajon, Oceanside, County of San Diego, San Diego, San Marcos, Santee, Vista
Industrial under construction	Chula Vista, County of San Diego, San Diego
Intensive agriculture	Carlsbad, Encinitas, Oceanside, Poway, County of San Diego, San Diego, Vista
Jail or prison	County of San Diego, Santee
Junior college	Encinitas, Escondido, San Diego
Junior high school or middle school	Carlsbad, El Cajon, Escondido, Oceanside, San Diego, Vista
Junkyard, dump, or landfill	Chula Vista, County of San Diego, San Diego
Lake, reservoir, or large pond	Chula Vista, Escondido, National City, Oceanside, Poway, County of San Diego, San Diego, Santee
Landscape open space	Carlsbad, Chula Vista, Coronado, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee, Solana Beach, Vista
Library	National City, Poway, County of San Diego
Light industry—general	Chula Vista, Del Mar, El Cajon, Lemon Grove, National City, Oceanside, County of San Diego, San Diego, Santee, Vista
Marina	Chula Vista, Coronado, National City, Oceanside, San Diego
Marine terminal	National City, San Diego

Land Use Type	Municipality
Military training	County of San Diego, San Diego
Military use	Coronado, County of San Diego, Imperial Beach, National City, San Diego
Mission	Oceanside, County of San Diego, San Diego
Mixed use	Del Mar, Escondido, Imperial Beach, National City, Oceanside, Poway, San Diego, San Marcos, Vista
Mobile home park	Carlsbad, Chula Vista, County of San Diego, El Cajon, Escondido, La Mesa, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Multifamily—residential	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Escondido, Imperial Beach, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Multifamily—residential without units	County of San Diego Escondido, National City, San Diego
Neighborhood shopping center	Carlsbad, Chula Vista, County of San Diego, Encinitas, Escondido, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Office (low rise)	Carlsbad, Chula Vista, County of San Diego, El Cajon, Encinitas, Escondido, La Mesa, Lemon Grove, National City, Poway, San Diego, San Marcos, Solana Beach, Vista
Open space park or preserve	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Orchard or vineyard	County of San Diego, Oceanside, San Diego
Other group quarters facility	Carlsbad, County of San Diego, El Cajon, Escondido, Oceanside, San Diego, San Marcos, Santee, Vista
Other health care	Chula Vista, County of San Diego, Del Mar, Escondido, San Diego, Vista
Other public services	Carlsbad, Chula Vista, County of San Diego, El Cajon, Escondido, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Other recreation—high	Carlsbad, Chula Vista, County of San Diego, El Cajon, Encinitas, National City, Poway, San Diego, San Marcos, Santee, Vista
Other recreation—low	County of San Diego, San Diego, Vista
Other retail trade and strip commercial	Carlsbad, Chula Vista, Coronado, County of San Diego, El Cajon, Escondido, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Other school	Carlsbad, County of San Diego, Escondido, National City, Oceanside, Poway, San Diego, San Marcos
Other transportation	Carlsbad, Chula Vista, County of San Diego, Del Mar, Imperial Beach, National City, Poway, San Diego
Other university or college	San Diego
Park—active	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Escondido, Imperial Beach, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Park & Ride lot	Chula Vista
Parking lot—structure	San Diego
Parking lot—surface	Chula Vista, Coronado, County of San Diego, National City, Oceanside, San Diego, San Marcos, Vista
Post office	County of San Diego, El Cajon, Escondido, Oceanside, San Diego
Public storage	Chula Vista, County of San Diego, El Cajon, Escondido, Oceanside, San Diego, San Marcos, Vista
Racetrack	County of San Diego, Del Mar
Rail station or transit center	County of San Diego, La Mesa, Oceanside, San Diego
Railroad right-of-way	Carlsbad, Chula Vista, County of San Diego, Del Mar, El Cajon, Encinitas, National City, Oceanside, San Diego, San Marcos, Solana Beach, Vista
Regional shopping center	Carlsbad, County of San Diego, Escondido, National City, Oceanside, San Diego
Religious facility	Chula Vista, County of San Diego, Escondido, Oceanside, Poway, San Diego, San Marcos, Santee, Vista

Land Use Type	Municipality
Residential recreation	Carlsbad, Chula Vista, Coronado, County of San Diego, Escondido, National City, Oceanside, San Diego, Santee, Vista
Residential under construction	Chula Vista, County of San Diego, Escondido, San Diego
Resort	Carlsbad, Coronado, County of San Diego, Oceanside, San Diego, Solana Beach
Road right-of-way	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Road under construction	San Diego
School district office	County of San Diego, Escondido, San Marcos
SDSU, CSU San Marcos, or UC San Diego	San Diego
Senior high school	Carlsbad, Chula Vista, County of San Diego, El Cajon, Escondido, Oceanside, San Diego, San Marcos, Santee
Service station	Carlsbad, Chula Vista, El Cajon, Encinitas, Escondido, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Single family—detached	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Single family—multiple units	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Single family—residential	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, Encinitas, Escondido, Oceanside, Poway, San Diego, Solana Beach, Vista
Single family–residential without units	Carlsbad, Coronado, County of San Diego, Del Mar, Encinitas, Escondido, Oceanside, Poway, San Diego, San Marcos, Solana Beach, Vista
Single room occupancy units (SROs)	San Diego
Spaced rural residential	Carlsbad, Chula Vista, County of San Diego, Del Mar, Encinitas, Escondido, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Specialty commercial	County of San Diego, San Diego
Stadium or arena	San Diego
Tourist attraction	County of San Diego, San Diego
UC San Diego hospital, VA hospital, or Balboa Hospital	San Diego
Undevelopable natural area	Coronado, County of San Diego, El Cajon, Escondido, National City, Oceanside, San Diego, Santee
Vacant and undeveloped land	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, Lemon Grove, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee, Vista
Warehousing	Chula Vista, County of San Diego, Del Mar, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos
Water	County of San Diego, Imperial Beach, Vista
Wholesale trade	Chula Vista, County of San Diego, Poway, San Diego, San Marcos

Source: FEMA 2025.

Compliance with local floodplain management ordinances (e.g., County of San Diego Flood Damage Prevention Ordinance, the City of San Diego floodplain ordinance [Chapter 14, Article 3, Division 1]) and water quality requirements (e.g., regional waste discharge requirements) would be required for all development projects to minimize flood hazards and associated risk of release of pollutants. Flood ordinances include requirements for reducing flood losses, including restricting uses that are dangerous to health, safety, and property due to erosion or water hazards; requiring uses vulnerable to floods to be protected from flood damage at the time of construction; controlling the alteration of natural floodplains; controlling filling, grading, or dredging that may increase flood damage; and preventing construction of flood barriers that will divert flood waters or increase flood hazards in other areas. Flood ordinances also include design standards for abutments to prevent collapse or lateral movement during a 100-year flood.

Development under the proposed Plan would occur in areas subject to inundation hazards from failure of a dam or levee, including coastal areas in the city of San Diego and areas downstream of Lake Murray, Sweetwater Reservoir, and Lower Otay Lake, as depicted in Figure 2-4 which shows the proposed 2035 SCS land use pattern. Planning and design of development projects would be required to comply with Policy S-9.6 of the County of San Diego General Plan Safety Element, which prohibits development in dam inundation areas to reduce the risk of damage associated with dam or levee failure.

Project designs and review approvals would include reference to the Safety Element, California Department of Conservation maps showing tsunami inundation areas, FEMA maps, and other pertinent resources to determine at-risk areas such that proposed projects in coastal and rough terrain areas are designed for safety. By complying with all applicable regulations and safety ordinances outlined above and in Section 4.10.2, "Regulatory Setting," storm flows would be controlled, substantially reducing flood hazards. Through the various requirements to incorporate floodplain management, safety ordinances, and siting requirements to restrict development in areas prone to flooding, the risk of pollutant release due to inundation by flood hazard, tsunami, or seiche would be minimized. Therefore, the regional growth and land use change would not substantially increase the risk of pollutant release due to inundation in a flood hazard, tsunami, or seiche zone. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to regional growth and land use changes, the transportation network improvements in place by 2035 would be located in or near coastal areas. Proposed improvements that lie in low elevations directly adjacent to the coast would be susceptible to tsunami, including coastal areas in the city of San Diego. However, the risk of tsunamis in the San Diego region is low. There is no historical precedent for large damaging seiches in the San Diego region; therefore, the risk of seiches and associated risk of pollutant release affecting transportation network improvements would be low.

Although the risk of tsunami and seiche and the associated risk of pollution release are low in the San Diego region, transportation improvements under the proposed Plan would occur in areas potentially subject to these hazards. Transportation network improvements within 100-year flood hazard areas, including mostly local roadway and arterial improvements, would be exposed to flood hazards. Table 4.10-4 shows the transportation network improvements planned for 2035 that would encroach upon 100-year floodplains.

Designing regional growth and land use projects to comply with NFIP mandates, the County of San Diego FMP, and County and City general plan safety elements and flood ordinances would minimize flood risk to

transportation improvements associated with the proposed Plan. Compliance with individual requirements or regulatory oversight, approval, or involvement from municipal and county flood control management agencies would further reduce the risk of pollutant release due to project site inundation by restricting uses that are dangerous to health, safety, and property due to erosion or water hazards; require uses vulnerable to floods to be protected from flood damage at the time of construction; control the alteration of natural floodplains; control filling, grading, or dredging that may increase flood damage; and prevent construction of flood barriers that divert flood waters or increase flood hazards in other areas. As described above, the NFIP mandates that development is not to proceed within the 100-year floodplain if development is expected to increase flood elevation by 1 foot or more, which would prohibit new development in areas subject to flooding which could increase the risk of pollutant release due to inundation.

Caltrans policies related to flooding require that engineered conveyances (whether hardscaped or soft bottom) integrate energy dissipation protection, streambank erosion protection, bridge pier scour protection, and other suitable design controls to eliminate or substantially reduce erosion and transport of sediment or silt to downstream areas. By incorporating these standard engineering practices flooding that could result in the release of pollutants as a result of inundation would be avoided or substantially reduced. Compliance with local floodplain management ordinances (e.g., County of San Diego Flood Damage Prevention Ordinance, the City of San Diego floodplain ordinance [Chapter 14, Article 3, Division 1]) would be required for all transportation network improvement projects to minimize impacts associated with flooding. Flood ordinances would include requirements for reducing flood hazards, including restricting uses that are dangerous to health, safety, and property due to erosion or water hazards; requiring uses vulnerable to floods and associated pollutant release to be protected from flood damage at the time of construction; controlling the alteration of natural floodplains; controlling filling, grading, or dredging that may increase flood damage and adverse water quality impacts; and preventing construction of flood barriers that will divert flood waters or increase flood hazards and the risk of conveyance of pollutants to other areas. Flood ordinances also include design standards for abutments to prevent collapse or lateral movement during a 100-year flood.

The risk of release of pollutants is related to local seismic conditions and potential flooding that could occur. As described in Section 4.9, "Hazards and Hazardous Materials," transportation improvements that would occur in the plan area could involve the use of pollutants during construction and operation. The use and storage of these pollutants is regulated to minimize the potential for accidental release. Local regulations, including floodplain management ordinances (e.g., County of San Diego Flood Damage Prevention Ordinance, the City of San Diego floodplain ordinance [Chapter 14, Article 3, Division 1]) are also in place that require flood protection to minimize impacts associated with flooding. Prior to flood events, measures such as sandbag barriers and gravel bag berms would be implemented and maintained to reduce the risk of pollutant release. As a result, there is not a substantial risk of pollutant release due to project inundation.

Table 4.10-4 2035 Transportation Network Improvements in the 100-Year Floodplain

Improvement Type	Improvement
Bike	Bayshore Bikeway Segment 1
Bike	Bayshore Bikeway: Barrio Logan Segment (Beardsley Street to Park Boulevard)
Bike	Bayshore Bikeway: Segment 8B—Palomar Street to Main Street

Source: FEMA 2025.

Transportation network improvements under the proposed Plan would also occur in areas subject to inundation hazards from failure of a dam or levee. Though more dams exist in the region, these areas are large reservoirs that would produce large volumes of water if a dam were to fail. Cal OES dam inundation maps and LFPZ maps would be reviewed for all projects associated with transportation network improvements of the proposed Plan to determine the extent of inundation for at-risk areas in the event of a dam or levee failure, in compliance with Policy S-9.6 of the County of San Diego General Plan Safety Element, which prohibits development in dam inundation areas to reduce the risk of damage associated with dam or levee failure. Planning and design of transportation network improvements would be required to comply with Policy S-9.6 of the County of San Diego

General Plan Safety Element, which prohibits development in dam inundation areas to reduce the risk of dam or levee failure hazards and associated pollutant release.

By incorporating the required design standards and complying with all applicable regulations and ordinances outlined above and in Section 4.10.2, "Regulatory Setting," impacts associated with release of pollutants due to inundation of a flood hazard, tsunami, or seiche zone would be minimized. Through the various requirements to incorporate floodplain management, safety ordinances, and siting requirements to prohibit development in areas prone to flooding, runoff would be controlled, flooding hazards would be substantially reduced, and the risks associated with tsunami and seiche hazards would be minimized. Safety policies from the Safety Element, such as the County of San Diego Safety Element policies discussed above, would reduce the risk of property damage associated with tsunami and seiche hazards. Therefore, the transportation network improvements would not substantially increase the risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone. This impact is less than significant.

2035 Conclusion

Compliance with applicable regulatory requirements and implementation of design measures, safety ordinances and policies, and hazardous materials storage requirements described above and in Section 4.10.2, "Regulatory Setting," would ensure that regional growth and land use changes, as well as transportation network improvements, would minimize the release of pollutants due inundation of a flood hazard, tsunami, or seiche zone. Through the various requirements to incorporate floodplain management, safety ordinances, and siting requirements to prohibit development in areas prone to flooding, the proposed Plan would not substantially increase the risk of pollutant release due to inundation in a flood hazard, tsunami, or seiche zone. Therefore, this impact (HWQ-4) in the year 2035 is less than significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. Project footprints that lie in low elevations directly adjacent to the coast would be susceptible to tsunami, including coastal areas within the cities of San Diego and Chula Vista; however, the risk of tsunamis in the San Diego region is low. There is no historical precedent for large damaging seiches in the San Diego region; therefore, the risk of seiches affecting regional growth and land use change development would be low.

Although the risk of tsunami and seiche and the associated risk of pollution release are considered low in the San Diego region, development under the proposed Plan would occur in areas subject to these hazards, such as the cities of San Diego and Chula Vista. Regional growth in 2050 would result in development within 100-year and 500-year flood hazard zones (see Figure 4.10-3). Designing regional growth land use projects to comply with NFIP mandates, the County of San Diego FMP, and County and City general plan safety elements and flood ordinances would minimize flood risk to development associated with the proposed Plan. As described above, the NFIP mandates that development is not to proceed within the 100-year floodplain if development is expected to increase flood elevation by 1 foot or more, which would prohibit new development in areas subject to flooding which could increase the risk of pollutant release due to inundation.

Development projects associated with regional growth in the Plan area would also be subject to the requirements of applicable municipal and county flood control management regulations and plans such as the County of San Diego FMP, and local floodplain management ordinances (e.g., the County of San Diego Flood Damage Prevention Ordinance, the City of San Diego floodplain ordinance [Chapter 14, Article 3, Division 1]). Compliance

with individual requirements or regulatory oversight, approval, or involvement from municipal and county flood control management agencies would further reduce the risk of pollutant release due to project site inundation.

The risk of release of pollutants is related to local seismic conditions and potential flooding that could occur. As described in Section 4.9, "Hazards and Hazardous Materials," development that occurs in the Plan area could include a range of type and intensity of pollutants during construction and operation. The use and storage of these pollutants is regulated to minimize the potential for accidental release. State and local regulations are also in place that require flood protection. Prior to flood events, measures such as sandbag barriers and gravel bag berms would be implemented and maintained to reduce the risk of pollutant release. As a result, there is not a substantial risk of pollutant release due to project inundation.

Compliance with enforced planning and design standards, regulations, and safety ordinances would serve to address and minimize the release of pollutants due to inundation in a flood hazard, tsunami, or seiche zone. Planning and design of development projects would be required to incorporate safety policies such as County of San Diego General Plan Safety Element Policy S-9.3, which requires development within mapped flood hazard areas be sited and designed to minimize on and off-site hazards to health, safety, and property due to flooding, and Policy S-9.6, which prohibits development in dam inundation areas to reduce the risk associated with flooding hazards. State planning and zoning law requires a safety element (City of San Diego 2015) in all city and county general plans that identifies and appraises hazards including the effects of seismically induced waves, such as tsunamis and seiches. The County of San Diego General Plan Safety Element policies S-9.3 and S-9.6 reduce the risk of flooding hazards by requiring development within mapped flood hazard areas to be sited and designed to minimize on and off-site hazards.

The regional growth and land use changes associated with the proposed Plan that are located in the existing floodplains, including the cities of San Diego and Chula Vista and San Diego County, would be impacted by a 100-year flood if appropriate design measures are not incorporated. Refer to Table 4.10-5 for the proposed changes in land use types that encroach upon the 100-year floodplain through 2050. However, as discussed in the 2035 analysis, compliance with local floodplain management ordinances (e.g., County of San Diego Flood Damage Prevention Ordinance, the City of San Diego floodplain ordinance [Chapter 14, Article 3, Division 1]) and water quality requirements (e.g., regional waste discharge requirements) would be required for all development projects to minimize hazards due to flood conditions and associated risk of release of pollutants. Planning and design of development projects would also be required to incorporate Policy S-9.6 of the County of San Diego General Plan Safety Element, which prohibits development in dam inundation areas to reduce the risk of damage associated with dam or levee failure.

By complying with all applicable regulations and ordinances outlined above and in Section 4.10.2, "Regulatory Setting," storm flows would be controlled, and flooding hazards would be substantially reduced. Through the various requirements to incorporate floodplain management, safety ordinances, and siting requirements to prohibit development in areas prone to flooding, the risk of pollutant release due to inundation by flood hazard, tsunami, or seiche would be minimized. Therefore, the regional growth and land use change would not substantially increase the risk of pollutant release due to inundation in a flood hazard, tsunami, or seiche zone. This impact is less than significant.

Table 4.10-5 2050 Land Use Types in the 100-Year Floodplain

Land Use Type	Municipality
Airstrip	County of San Diego
Arterial commercial	Carlsbad, Chula Vista, Coronado, El Cajon, Encinitas, Escondido, Imperial Beach, Lemon Grove, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee, Solana Beach, Vista
Automobile dealership	Chula Vista, El Cajon, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Vista
Bay or lagoon	Carlsbad, Chula Vista, Coronado, Del Mar, Encinitas, Imperial Beach, National City, Oceanside, County of San Diego, San Diego, Solana Beach

Land Use Type	Municipality
Beach—active	Carlsbad, Coronado, Encinitas, Oceanside, County of San Diego, San Diego
Beach—passive	Carlsbad, Coronado, Del Mar, Encinitas, Oceanside, County of San Diego, San Diego
Casino	County of San Diego
Cemetery	County of San Diego, San Diego
Commercial under construction	Encinitas, San Diego, Santee
Communications and utilities	Carlsbad, Chula Vista, Coronado, Del Mar, Escondido, National City, Oceanside, County of San Diego, San Diego, San Marcos, Vista
Community shopping center	Carlsbad, Chula Vista, El Cajon, Encinitas, Escondido, La Mes, National City, Oceanside, County of San Diego, San Diego, San Marcos, Santee, Vista
Convention center	San Diego
Dormitory	San Diego
Elementary school	Chula Vista, Escondido, National City, Oceanside, Poway, County of San Diego, San Diego, Santee, Vista
Extractive industry	Chula Vista, Coronado, National City, Poway, County of San Diego, San Diego
Field crops	Carlsbad, Encinitas, Escondido, Oceanside, Poway, County of San Diego, San Diego, San Marcos
Fire or police station	Chula Vista, Escondido, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Vista
Freeway	Carlsbad, Chula Vista, El Cajon, Encinitas, Escondido, La Mesa, Lemon Grove, National City, Oceanside, County of San Diego, San Diego, San Marcos, Santee, Vista
General aviation airport	El Cajon, Oceanside, County of San Diego
Golf course	Carlsbad, Chula Vista, Coronado, Escondido, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee
Golf course clubhouse	Chula Vista, National City, County of San Diego, San Diego
Government office or civic center	Coronado, Poway, County of San Diego, San Diego
Group quarters	San Marcos
Heavy industry	San Diego
Hospital—general	San Diego
Hotel or motel (high rise)	San Diego
Hotel or motel (low rise)	Carlsbad, Chula Vista, Del Mar, El Cajon, La Mesa, National City, Oceanside, County of San Diego, San Diego, San Marcos
Industrial park	Carlsbad, Chula Vista, El Cajon, Oceanside, County of San Diego, San Diego, San Marcos, Santee, Vista
Industrial under construction	Chula Vista
Intensive agriculture	Carlsbad, Encinitas, Oceanside, Poway, County of San Diego, San Diego
Jail or prison	County of San Diego, Santee
Junior college	Encinitas, Escondido, San Diego
Junior high school or middle school	Carlsbad, El Cajon, Escondido, Oceanside, San Diego, Vista
Junkyard, dump, or landfill	Chula Vista, County of San Diego, San Diego
Lake, reservoir, or large pond	Chula Vista, Escondido, National City, Oceanside, Poway, County of San Diego, San Diego, Santee
Landscape open space	Carlsbad, Chula Vista, Coronado, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee, Solana Beach, Vista
Library	National City, Poway, County of San Diego

Land Use Type	Municipality
Light industry—general	Chula Vista, Del Mar, El Cajon, Lemon Grove, National City, Oceanside, County of San Diego, San Diego, San Marcos, Santee, Vista
Marina	Chula Vista, Coronado, National City, Oceanside, San Diego
Marine terminal	National City, San Diego
Military training	County of San Diego, San Diego
Military use	Coronado, County of San Diego, Imperial Beach, National City, San Diego
Mission	Oceanside, County of San Diego, San Diego
Mixed use	Chula Vista, Coronado, Del Mar, El Cajon, Escondido, Imperial Beach, National City, Oceanside, Poway, San Diego, San Marcos, Vista
Mobile home park	Carlsbad, Chula Vista, County of San Diego, El Cajon, Escondido, La Mesa, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Multifamily—residential	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Escondido, Imperial Beach, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Multifamily—residential without units	County of San Diego Escondido, National City, San Diego
Neighborhood shopping center	Carlsbad, Chula Vista, County of San Diego, Encinitas, Escondido, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Office (low rise)	Carlsbad, Chula Vista, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, La Mesa, Lemon Grove, National City, Poway, San Diego, San Marcos, Solana Beach, Vista
Open space park or preserve	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, Encinitas, Escondido, Imperial Beach, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Orchard or vineyard	County of San Diego, Oceanside, San Diego
Other group quarters facility	Carlsbad, County of San Diego, El Cajon, Escondido, Oceanside, San Diego, San Marcos, Santee, Vista
Other health care	Chula Vista, County of San Diego, Del Mar, Escondido, San Diego, Vista
Other public services	Carlsbad, Chula Vista, County of San Diego, El Cajon, Escondido, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Other recreation—high	Carlsbad, Chula Vista, County of San Diego, El Cajon, Encinitas, National City, Poway, San Diego, San Marcos, Vista
Other recreation—low	County of San Diego, San Diego, Vista
Other retail trade and strip commercial	Carlsbad, Chula Vista, Coronado, County of San Diego, El Cajon, Escondido, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Other school	Carlsbad, County of San Diego, Escondido, National City, Oceanside, Poway, San Diego, San Marcos
Other transportation	Carlsbad, County of San Diego, Del Mar, Imperial Beach, National City, Poway, San Diego
Other university or college	San Diego
Park—active	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Escondido, Imperial Beach, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Parking lot—surface	Chula Vista, Coronado, County of San Diego, National City, Oceanside, San Diego, San Marcos, Vista
Post office	El Cajon, Escondido, Oceanside, San Diego
Public storage	Chula Vista, County of San Diego, El Cajon, Escondido, Oceanside, San Diego, San Marcos, Vista
Public or semipublic	San Marcos

Land Use Type	Municipality
Racetrack	County of San Diego, Del Mar
Rail station or transit center	County of San Diego, La Mesa, Oceanside, San Diego
Railroad right-of-way	Carlsbad, Chula Vista, County of San Diego, Del Mar, El Cajon, Encinitas, La Mesa, National City, Oceanside, San Diego, San Marcos, Solana Beach, Vista
Regional shopping center	Carlsbad, Escondido, National City, Oceanside, San Diego
Religious facility	Chula Vista, County of San Diego, Escondido, Oceanside, Poway, San Diego, San Marcos, Santee, Vista
Residential recreation	Carlsbad, Chula Vista, Coronado, County of San Diego, Escondido, National City, Oceanside, San Diego, Santee, Vista
Residential under construction	Chula Vista, County of San Diego, Escondido, San Diego
Resort	Carlsbad, Coronado, County of San Diego, Oceanside, San Diego, Solana Beach
Road right-of-way	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Road under construction	San Diego
School district office	County of San Diego, Escondido, San Marcos
SDSU, CSU San Marcos, UC San Diego	San Diego
Senior high school	Carlsbad, Chula Vista, County of San Diego, El Cajon, Escondido, Oceanside, San Diego, San Marcos, Santee
Service station	Carlsbad, Chula Vista, El Cajon, Encinitas, Escondido, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Single family—detached	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Single family—multiple units	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, Vista
Single family—residential	County of San Diego, Oceanside
Single family—residential without units	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, Encinitas, Escondido, Oceanside, Poway, San Diego, Solana Beach, Vista
Single room occupancy units (SROs)	San Diego
Spaced rural residential	Carlsbad, Chula Vista, County of San Diego, Del Mar, Encinitas, Escondido, Poway, San Diego, San Marcos, Santee, Vista
Specialty commercial	County of San Diego, Oceanside, San Diego
Stadium or arena	San Diego
Tourist attraction	County of San Diego, San Diego
UC San Diego hospital, VA hospital, or Balboa Hospital	San Diego
Undevelopable natural area	Coronado, County of San Diego, El Cajon, Escondido, National City, Oceanside, San Diego, Santee
Vacant and undeveloped land	Carlsbad, Chula Vista, Coronado, County of San Diego, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, National City, Oceanside, Poway, County of San Diego, San Diego, San Marcos, Santee, Vista

Land Use Type	Municipality
Warehousing	Chula Vista, County of San Diego, Del Mar, Lemon Grove, National City, Oceanside, Poway, San Diego, San Marcos
Water	County of San Diego, Imperial Beach, Vista
Wholesale trade	Chula Vista, County of San Diego, Poway, San Diego, San Marcos

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to regional growth and land use change, the transportation network improvements in place by 2050 would be located in or near coastal areas. Proposed improvements that lie in low elevations directly adjacent to the coast would be susceptible to tsunami, including coastal areas in the city of San Diego; however, the risk of tsunamis in the San Diego region is low. There is no historical precedence for large damaging seiches in the San Diego region; therefore, the risk of seiches and associated risk of pollutant release affecting transportation network improvements would be low.

Although the risk of tsunami and seiche and the associated risk of pollution release are low in the San Diego region, transportation improvements under the proposed Plan would occur in areas potentially subject to these hazards.

Transportation network improvements within 100-year flood hazard areas, including Managed Lanes and Managed Lane connectors, would be exposed to flood hazards without the appropriate design measures. Table 4.10-6 shows the transportation network improvements planned for 2050 that would encroach upon the 100-year floodplain. Caltrans policies related to flooding require that engineered conveyances (whether hardscaped or soft bottom) integrate energy dissipation protection, streambank erosion protection, bridge pier scour protection, and other suitable design controls to eliminate or substantially reduce erosion and transport of sediment or silt to downstream areas. By incorporating these standard engineering practices flooding that could result in the release of pollutants as a result of inundation would be avoided or substantially reduced. By incorporating the required design standards and complying with all applicable regulations and ordinances outlined above and in Section 4.10.2, "Regulatory Setting," impacts associated with release of pollutants due to inundation of a flood hazard, tsunami, or seiche zone would be minimized. Through the various requirements to incorporate floodplain management, safety ordinances and policies, flooding hazards would be substantially reduced, and the risks associated with tsunami and seiche hazards would be minimized. Therefore, the transportation network improvements would not substantially increase the risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone. This impact is less than significant.

Table 4.10-6 2050 Transportation Network Improvements in the 100-Year Floodplain

Improvement Type	Improvement
Bike	Bear Valley Bikeway
Bike	Chollas Creek Bikeway: North Fork
Bike	Clairemont Mesa to Linda Vista Bikeway
Bike	Golden Hill to Fairmount Park
Bike	I-15 Bikeway: Murphy Canyon Road to Affinity Court
Bike	I-15 Bikeway: Poway Road interchange to Carmel Mountain Road
Bike	I-15 Bikeway: Via Rancho Parkway to Citracado Parkway

Improvement Type	Improvement
Bike	I-805 connector: Bonita Road to Floyd Avenue
Bike	I-805 connector: Bonita Road to H Street
Bike	Midway to Pacific Beach Bikeway
Bike	North Coast Bike Trail
Bike	North County Inland Bikeway: El Camino Real
Bike	Pacific Highway Coastal Rail Trail airport connections (PACTAC)
Bike	San Diego River Bikeway connections
Bike	San Luis Rey River Trail
Bike	Saturn Boulevard Bikeway
Bike	SR 125 Connector: Bonita Road to United States–Mexico Border
Bike	SR 52 Bikeway: I-5 to Santo Road
Bike	SR 94 multiuse pathway
Highway	I-15 Managed Lanes
Highway	I-5 Managed Lanes

2050 Conclusion

Compliance with applicable regulatory requirements and implementation of design measures, safety ordinances and policies, and hazardous materials storage requirements described above and in Section 4.10.2, "Regulatory Setting," would ensure that regional growth and land use changes, as well as transportation network improvements, would minimize the release of pollutants due inundation of a flood hazard, tsunami, or seiche zone. Through the various requirements to incorporate floodplain management, safety ordinances, and siting requirements to prohibit development in areas prone to flooding, the proposed Plan would not substantially increase the risk of pollutant release due to inundation in a flood hazard, tsunami, or seiche zone. Therefore, this impact (HWQ-4) in the year 2050 is less than significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change and transportation network improvements would result in risk of pollution from inundation in flood hazard, tsunami, and seiche zones. Climate change is increasing the risk of inundation especially in established flood hazard zones. Chollas, Mission Valley, Sorrento Valley and the Tijuana River Valley in the City of San Diego as well as Oceanside, San Marcos, Escondido, and Encinitas have been identified as the most flood-prone areas (City of San Diego n.d.-b). Parts of El Cajon, Santee, and Poway have been designated as floodplains (Caoile 2024). As stormwater travels, it collects trash, bacteria, and toxic pollutants such as detergents, fertilizers, pesticides, motor oil, heavy materials, and pet waste and distributes that into the region's water bodies. Pollution from these hazards can be minimized if development and transportation projects implemented by the proposed Plan remain in compliance with applicable regulatory requirements design measures, safety ordinances, and water quality requirements. The proposed Plan's inundation risks would be worsened by climate change; however, regulatory requirements, design measures, safety ordinances, and water quality requirements would reduce risks.

MITIGATION MEASURES

No mitigation measures are required for this impact.

4.10.5 Cumulative Impacts Analysis

C-HWQ-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO HYDROLOGY AND WATER QUALITY

The area of geographic consideration for cumulative impacts on hydrology and water quality is the Southern California and Northern Baja California region. The analysis of cumulative hydrology and water quality impacts considers how land use change and the transportation system would impact hydrology and water quality across the Southern California and Northern Baja region as a whole because the majority of water bodies in the San Diego area are part of hydrologic systems located across multiple jurisdictions. As a result, water pollution or alterations to a portion of a watershed produced by urban development in one jurisdiction can result in hydrology and water quality impacts that affect other jurisdictions or the entire region.

A projection approach for hydrology and water quality cumulative analysis allows for an overarching discussion of regional and cross-border impacts throughout multiple watersheds associated with general patterns of regional urbanization, growth, and land use changes while also allowing for specific consideration of any projects with known impacts to hydrology and water quality. Cumulative impacts on hydrology and water quality are evaluated in two steps. First, the combined effects of the proposed Plan, adopted plans, and probable future projects are considered to determine whether their impacts are collectively (i.e., cumulatively) significant. If the cumulative impact is significant, the proposed Plan's incremental contribution is then assessed to determine whether it is cumulatively considerable, which would be considered a significant cumulative impact associated with the Plan. Specifically, significant cumulative impacts related to hydrology and water quality would occur if the Plan would result in a considerable contribution to a cumulatively significant degradation of water quality in violation of any water quality standards or waste discharge requirements or substantial increased sources of polluted runoff;

substantial reduction in groundwater quantity or quality; substantial alteration of the existing drainage pattern of an area such that flood risk, erosion, or siltation would increase; exposure of people, structures, or facilities to a significant risk involving flooding; or exposure of people or structures to a significant risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone.

Impacts of the Proposed Plan

Compliance with existing regulatory requirements described in Section 4.10.2, "Regulatory Setting," would ensure that the regional growth and land use change and the transportation network improvements would not result in: substantial degradation of water quality in violation of any water quality standards or waste discharge requirements, or substantial increased sources of polluted runoff; substantial reduction in groundwater quantity or quality; substantial alteration of the existing drainage pattern of an area such that flood risk, erosion, or siltation would increase; exposure of people, structures, or facilities to a significant risk involving flooding; or exposure of people or structures to a significant risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone. These impacts would be less than significant in 2035 and 2050 (Impact HWQ-1 through HWQ-4).

Impacts of Related Projects

Projects planned in the Southern California region, such as the Navy OTC Revitalization Project, San Diego International Airport (SDIA) Airport Development Plan, California High-Speed Rail Train, Midway Rising Specific Plan, and City of San Diego Pure Water North City, would involve ground-disturbing activities that could result in impacts related to water quality and changes to drainage. Other land development and infrastructure projects throughout the region, such as transportation infrastructure, energy generation and transmission corridors, and commercial and residential land development, would also result in impacts if these projects were not in compliance with federal, state, and local water quality requirements, such as the CWA implemented by Porter-Cologne Act; Water Code Section 13000 et seq.; NPDES regulations; and the Municipal Permit.

Impacts of Projections in Adopted Plans

The Southern California Association of Governments 2024-2050 Regional Transportation Plan/Sustainable Communities Strategy (2024-2050 RTP/SCS) EIR identified the potential to violate water quality standards associated with wastewater and storm water permits. The EIR also concluded that the 2024-2050 RTP/SCS would alter the existing drainage patterns in ways that would result in substantial erosion or siltation. Implementation was found to also reduce groundwater infiltration due to increased impervious surfaces and increase flooding hazards by locating projects on alluvial fans and in 100-year flood hazard areas. These water quality and hydrology impacts would be significant and unavoidable, even with the implementation of proposed mitigation (SCAG 2024).

The 2019 IRWM Plan was prepared by the San Diego Regional Water Management Group, which consists of the San Diego County Water Authority (SDCWA), the City of San Diego, and the County of San Diego. IRWM planning is a relatively new California initiative with regional plans designed to improve collaboration in water resources management and comprehensively address all aspects of water management and planning throughout an IRWM region. IRWM plans cross jurisdictional and watershed boundaries; involve multiple agencies, stakeholders, individuals, and groups; and attempt to address the issues and differing perspectives of all the entities involved through mutually beneficial solutions. Specific to water quality, the IRWM includes Objective H to effectively reduce sources of pollutants and environmental stressors to protect and enhance human health, safety, and the environment (Regional Water Management Group 2018).

Water quality control plans or basin plans have been written by each RWQCB. These plans determine the beneficial uses of each water body in the basin and set forth narrative and numerical WQOs for constituents that could have a substantial impact related to those beneficial uses. They also describe implementation programs to protect the beneficial uses of all water in the region, and surveillance and monitoring activities to evaluate the effectiveness of the basin plan. For example, the San Diego Basin Plan includes multiple policies specific to the protection of water quality, including Policy Three, "Point sources and nonpoint sources of pollution shall be

controlled to protect designated beneficial uses of water," and Policy Four, "Instream beneficial uses shall be maintained, and when practical, restored, and enhanced" (San Diego RWQCB 2021).

Adopted land use plans for local jurisdictions in Southern California would support the construction of new development and redevelopment through policy changes, general plan updates, and zoning amendments that encourage and facilitate population growth and land use changes. These development projects would impact hydrology and water quality. The severity of these impacts would be determined by location of the projects within the watersheds, and the sensitivity of the receiving bodies and the types of BMPs employed. All US projects would be required to adhere to all of the regulatory requirements described in Section 4.10.2, "Regulatory Setting." Projects associated with policy changes and amendments would also impact hydrology and water quality for the same reasons as discussed with infrastructure projects.

Waste discharges into some receiving waters from Northern Baja California would ultimately enter the Tijuana River and the Pacific Ocean where the waste would impact beaches in the southern part of the San Diego region. The Tijuana River is a 303(d)-listed water body for various impairments. The Tijuana River Estuary, a National Estuarine Sanctuary, supports a variety of threatened and endangered plants and animals and is 303(d)-listed for eutrophic conditions, indicator bacteria, lead, low dissolved, oxygen, nickel, pesticides, thallium, trash, toxicity, and turbidity (San Diego RWQCB 2021). Discharges from Northern Baja, which are not controlled by regional regulations, would impact these water bodies within the region.

Some of the plans considered in the cumulative analysis include the Water Quality Control Plans for the five basins in the greater region: San Diego Basin, Colorado River Basin, Santa Ana Basin, Los Angeles Basin, and the Lahontan Basin (San Diego RWQCB 2021; CRB RWQCB 2024; Santa Ana RWQCB 1995; LA RWQCB 1994; Lahontan RWQCB 2021). These basin plans set forth WQOs for constituents that could have a significant impact related to the beneficial uses of water. Although these documents do not have accompanying environmental analysis, they provide important overarching strategies, future planning considerations, and planned large projects related to water quality and hydrology throughout the region.

Cumulative Impacts and Impact Conclusions

2035

Substantial Degradation of Surface or Groundwater Quality Plans

As described above, compliance with federal, state, and local water quality requirements, such as the CWA implemented by Porter-Cologne Act, Water Code Section 13000 et seq.; NPDES regulations; and the Municipal Permit, would ensure that implementation of the proposed Plan would not result in a substantial degradation of water quality in violation of any water quality standards or waste discharge requirements. When the proposed Plan's impact are added to impacts related to surface or groundwater quality in water sources originating in the United States cumulative impacts would be less than significant due to federal and state regulatory requirements also applicable to development throughout the region for the protection of WQOs. WQOs would protect beneficial uses throughout Southern California and ensure effectiveness of regulations pertaining to water quality and hydrologic modifications.

However, contributions to cumulative water quality impacts occur in part because polluted water from Northern Baja California, which is not subject to federal and state regulatory requirements, discharges into the Tijuana River and affects receiving waters throughout the region. Although impacts exist due to unregulated polluted water that enters the region, the proposed Plan would not add to this water quality impact to produce a significant cumulative water quality impact for the reasons outlined above, including adherence to federal and state regulatory requirements.

Thus, cumulative water quality impacts would not be significant, and the proposed Plan's contribution to the cumulative water quality impact would not be cumulatively considerable in 2035.

Drainage and Release of Pollutants in Flood or Seiche Zones

As described above, in 2035, implementation of the proposed Plan would not result in ; substantial alteration of the existing drainage pattern of an area such that flood risk, erosion, or siltation would increase; would not expose e people, structures, or facilities to a significant risk involving flooding; and would not exposure of people or structures to a significant risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone. When the proposed Plan's impact is added to impacts related to substantial alteration of the existing drainage pattern of an area such that flood risk, erosion, or siltation within the Southern California and Northern Baja California region, cumulative impacts would be less than significant due to federal and state regulatory requirements, such as flood ordinances and the Municipal permit also applicable to development throughout the region for the protection of water quality from pollutants. Therefore, the proposed Plan would not result in a cumulatively considerable contribution to a cumulative impact related to adverse hydrological effects caused by depletion of groundwater, changes in drainage patterns, or the release of pollutants in flood or seiche zones.

2050

Substantial Degradation of Surface or Groundwater Quality Plans

As described above, compliance with federal, state, and local water quality requirements such as the CWA implemented by Porter-Cologne Act, Water Code Section 13000 et seq.; NPDES regulations; and the Municipal Permit, would ensure that implementation of the proposed Plan would not result in a result in a substantial degradation of water quality in violation of any water quality standards or waste discharge requirements. When the proposed Plan's impact are added to impacts related to surface or groundwater quality in water sources originating in the United States cumulative impacts would be less than significant due to federal and state regulatory requirements also applicable to development throughout the region for the protection of WQOs to protect beneficial uses throughout Southern California, and the effectiveness of regulations pertaining to water quality and hydrologic modifications.

However, contributions to cumulative water quality impacts occur in part because polluted water from Northern Baja California, which is not subject to federal and state regulatory requirements, discharges into the Tijuana River and affects receiving waters throughout the region. Although impacts exist due to unregulated polluted water that enters the region, the proposed Plan would not add to this water quality impact to produce a significant cumulative water quality impact for the reasons outlined above, including adherence to federal and state regulatory requirements. Thus, cumulative water quality impacts would not be significant, and the proposed Plan's contribution to the cumulative water quality impact would not be cumulatively considerable in 2050.

Drainage and Release of Pollutants in Flood or Seiche Zones

As described above, in 2050, implementation of the proposed Plan would not result in substantial alteration of the existing drainage pattern of an area such that flood risk, erosion, or siltation would increase; would not expose people, structures, or facilities to a significant risk involving flooding; and would not exposure of people or structures to a significant risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone. When the proposed Plan's impact is added to impacts related to substantial alteration of the existing drainage pattern of an area such that flood risk, erosion, or siltation within the Southern California and Northern Baja California region, cumulative impacts would be less than significant due to federal and state regulatory requirements, such as flood ordinances and the Municipal permit also applicable to development throughout the region for the protection of water quality from pollutants. Therefore, the proposed Plan would not result in a cumulatively considerable contribution to a cumulative impact related to adverse hydrological effects caused by depletion of groundwater, changes in drainage patterns, or the release of pollutants in flood or seiche zones.

MITIGATION MEASURES

No mitigation measures are required.

4.11 LAND USE AND PLANNING

This section evaluates the land use and planning impacts of the proposed Plan.

4.11.1 Existing Conditions

REGIONAL SETTING

Historical Land Use and Regional Growth Patterns

The San Diego region is located in the southwestern corner of the United States and is bordered by Mexico to the south, the Pacific Ocean to the west, Orange and Riverside counties to the north, and Imperial County to the east. The San Diego region encompasses over 4,260 square miles and includes 18 incorporated cities, 17 tribal governments, and unincorporated San Diego County.

Existing Land Use

There are 2,725,648 acres in the San Diego region. Approximately 799,266 acres (30%) are developed by various land uses including residential, commercial/office, and industrial or generally support human activities, such as agriculture, military use, recreation, and infrastructure (transportation, communication, utilities) (SANDAG 2021a). Open space parks account for the largest land area, with 1,374,188 acres, or about 50% of the region. Vacant land (524,010 acres) accounts for another 19%, while the remaining approximately 1% of the land area is covered by water (28,184). Table 4.11-1 breaks down the entire San Diego region by land use type for 2022. The 2022 land use pattern is shown in Figure 4.11-1.

Table 4.11-1 Existing Land Use in the San Diego Region (2022)

Land Use Type	Acres
Agriculture	110,103
Commercial and office	20,142
Education and institutions	24,302
Heavy and light industry	18,734
Military	93,286
Mixed use	223
Mobile homes	5,896
Multifamily residential	16,637
Open space parks	1,374,188
Recreation	38,946
Single-family residential	143,477
Spaced rural residential	213,476
Transportation, communications, utilities	111,564
Under construction	2,482
Vacant	524,010
Water	28,184
Total	**2,725,648**

Notes:
[1] Total is 2 acres less than the sum of each land use listed in the table, due to the rounding of acreages for each land use type.

Source: SANDAG 2025.

Regional Growth Pattern for Local Jurisdictions

The western portion of the region consists of all 18 of the region's incorporated cities and military lands. As of 2022, development in this area consisted primarily of single-family residential development interspersed with open space parks and recreation land. Most of the region's multifamily residential, commercial and office, and industrial land uses also are found in the western third of the region. The eastern portion of the region is in the jurisdiction of the unincorporated county as well as 17 tribal governments. This area is predominantly characterized by open space and parks, but also the tribal reservations, vacant land, rural residential land, agriculture, and small pockets of single-family residential. Development in the eastern two-thirds is generally rural and low-density relative to the higher density urban development of the western third. Over the last decade, many local jurisdictions have updated their land use plans and zoning ordinances, which collectively moved the region's vision of the future toward more compact development near transit with greater open space preservation. Focusing on housing and job centers in existing urbanized areas has replaced previous assumptions of more dispersed development patterns.

Table 4.11-2 provides details about existing population, area and transportation networks in the local jurisdictions.

Table 4.11-2 Jurisdictional Information

Jurisdiction	Size (square miles)	2022 Population	Percent of Regional Population	Major Highways	Major Transit Systems
Carlsbad	39.1	115,585	3.5	I-5, SR 78	COASTER, Amtrak, NCTD Bus
Chula Vista	50.9	276,785	8.4	I-5, I-805, SR 125, SR 54	Trolley, MTS bus
Coronado	14.0	22,277	0.7	SR 75, SR 282	MTS bus
Del Mar	1.8	3,929	0.1	None	COASTER, Amtrak, NCTD bus
El Cajon	14.4	105,638	3.2	I-8, SR 125, SR 67	Trolley, MTS bus
Encinitas	19.6	61,515	1.9	I-5	COASTER, Amtrak, NCTD bus
Escondido	36.2	150,679	4.6	I-15, SR 78	SPRINTER, NCTD bus, MTS bus

Figure 4.11-1 2022 Land Use

Other Public and Non-Jurisdictional Lands

Tribal Governments

The San Diego region is home to 19 Native American reservations represented by 17 tribal governments, the most in any county in the United States, as shown in Figure 4.11-2. There are more than 135,000 acres of tribal reservation lands in the region (SanGIS 2025). As sovereign domestic nations, tribal governments govern land use on their reservations and land holdings. SANDAG and the regional tribal governments work together to facilitate government-to-government planning and coordination. Table 4.11-3 details information regarding federally recognized tribal nations in the San Diego region.

Table 4.11-3 Tribal Nations in the San Diego Region

Tribal Nation	Reservation Name	Population	Housing Units	Reservation Acreage	Location
Barona Band of Mission Indians	Barona	514	157	7,434	Barona Indian Reservation near Lakeside, about 30 miles northeast of San Diego
Campo Band of Mission Indians of the Kumeyaay Nation	Campo	502	138	15,674	Southeastern San Diego County in the Laguna Mountains
Joint Power Authority between Barona and Viejas	Capitan Grande	0	0	15,632	Northwest quadrant of the Cleveland National Forest
Ewiiaapaayp Band of Kumeyaay Indians	Ewiiaapaayp	0	0	5,549	Immediately east of Cleveland National Forest and west of Anza-Borrego Desert State Park off of CR 1
Inaja Cosmit Band of Diegueño Mission Indians	Inaja and Cosmit	0	0	809	Within the boundaries of Cleveland National Forest, southwest of Julian, off SR 78
Jamul Indian Village of Kumeyaay Nation	Jamul Indian Village	0	0	6	10 miles southeast of El Cajon, along SR 94
La Jolla Band of Luiseño Indians	La Jolla	221	107	8,879	On Mount Palomar; off SR 76, 25 miles east of Escondido
La Posta Band of the Kumeyaay Nation	La Posta	65	13	3,848	56 miles east of San Diego and 46 miles west of El Centro in the Laguna Mountains
Los Coyotes Band of Cahuilla/Cupeño Indians	Los Coyotes	87	36	24,786	50 miles east of San Diego between Cleveland National Forest and Anza-Borrego Desert State Park
Manzanita Band of Diegueño Mission Indians	Manzanita	87	28	4,551	In southeastern San Diego County off of I-8, near the town of Boulevard and in the Carrizo Desert
Mesa Grande Band of Diegueño Mission Indians	Mesa Grande	60	29	1,833	Near Santa Ysabel, north of Highway 78
Pala Band of Mission Indians	Pala	924	308	14,235	40 miles northeast of San Diego, on the San Luis Rey River
Pauma Band of Luiseño Indians	Pauma and Yuima	132	48	5,982	Northeastern corner of San Diego County, in the foothills of Mount Palomar

Tribal Nation	Reservation Name	Population	Housing Units	Reservation Acreage	Location
Pechanga Band of Indians	Pechanga	337	168	88	Northwestern corner of San Diego County
Rincon Band of Luiseño Indians	Rincon	1,059	321	4,764	Northeastern corner of San Diego County, along the San Luis Rey River
San Pasqual Band of Diegueño Mission Indians	San Pasqual	1,153	319	1,967	12 miles from Escondido, adjoining the community of Valley Center and on CR S6
Iipay Nation of Santa Ysabel	Santa Ysabel	147	57	15,368	Near Santa Ysabel and Julian along SR 76
Sycuan Band of the Kumeyaay Nation	Sycuan	110	39	2,233	6 miles from El Cajon between I-8 and SR 94
Viejas Band of Kumeyaay Indians	Viejas	211	84	1,687	35 miles east of San Diego, north of I-8 and Alpine, 30 miles north of the United States–Mexico border

Notes: CR = County Road; SR = State Route; I = Interstate. This table provides information on residential occupancy on the reservations and not data on tribal enrollment because tribal members can and do live on and off reservations.

Military Installations

San Diego's location on the Pacific Ocean is ideal for many military operations in the southwest portion of the country. San Diego's military installations, shown in Figure 4.11-3, include a variety of sizes and uses and provide a large employment base for the region. Major military installations in the region include Marine Corps Base (MCB) Camp Pendleton, Naval Base Point Loma, Marine Corps Recruit Depot (MCRD) San Diego, Marine Corps Air Station (MCAS) Miramar, and Naval Base Coronado (NBC), as described in greater detail below:

- MCB Camp Pendleton is located at the northern boundary of San Diego County near Oceanside and encompasses more than 125,000 acres. Located approximately 38 miles north of Downtown San Diego in North County, MCB Camp Pendleton offers a broad spectrum of training facilities for many active and reserve Marine, Army, and Navy units, as well as national, State, and local agencies (MCB Camp Pendleton n.d.).
- Naval Base Point Loma is located on approximately 280 acres of coastal land just west and north of Downtown San Diego. Naval Base Point Loma provides support to 70 US Pacific Fleet afloat and shore-based tenant commands headquartered on the base and is a highly technical hub of naval activity (My Base Guide n.d.).
- MCRD San Diego is located on 506 acres northwest of downtown San Diego, adjacent to San Diego International Airport (SDIA). MCRD San Diego provides training for marines as well as military community and family services.
- MCAS Miramar is located on approximately 23,000 acres in the western central portion of the region. It is home to the 3d Marine Aircraft Wing and is centrally located near more than 10 West Coast Navy and Marine Corps installations (MCAS Miramar n.d.).
- NBC is a consolidated Navy installation encompassing eight military facilities stretching from San Clemente Island, which is located 70 miles west of San Diego, to the La Posta Mountain Warfare Training Facility, which is located 60 miles east of San Diego. Those facilities include Naval Air Station North Island; Naval Amphibious Base Coronado; Naval Outlying Landing Field Imperial Beach; Naval Auxiliary Landing Field San Clemente Island; Silver Strand Training Complex; Camp Michael Monsoor; and the Survival, Evasion, Resistance and Escape Facility in Warner Springs. Naval Air Station North Island is the anchor base of NBC (US Navy n.d.).

Figure 4.11-3 Military Installations in the San Diego Region

San Diego Unified Port District

The San Diego Unified Port District (Port) was created by the California State Legislature to manage San Diego Bay and surrounding waterfront land. The Port oversees two maritime cargo terminals, two cruise ship terminals, 20 public parks, various wildlife reserves and environmental initiatives, the Harbor Police department, and the leases of more than 600 tenant and subtenant businesses around San Diego Bay. The Port has been granted authority for an approximate total of 5,483 acres or about 37% of the total tidelands on San Diego Bay. The shoreline frontage approaches 33 miles, which is equivalent to 61% of the total bay shoreline (San Diego Unified Port District 2025). The Port has a Port Master Plan, which is intended to provide the official planning policies, consistent with a general statewide purpose, for the physical development of the tide and submerged lands conveyed and granted in trust to the Port District (San Diego Unified Port District 2024). The Port is currently in the process of updating its Port Master Plan (referred to as the Port Master Plan Update), where the California Coastal Commission approval is anticipated in 2025.

Airport Authority

The San Diego County Regional Airport Authority (SDCRAA) was created on January 1, 2003, as an independent agency to manage the day-to-day operations of SDIA and also serve as the region's airport land use commission (ALUC) to ensure the adoption of land use plans that protect public health and safety for areas surrounding all 16 of the San Diego region's public and private airports (SDCRAA 2025); these airports are listed in Table 4.11-4. SDCRAA accomplishes this by the orderly development of airports and the adoption of land use measures that minimize the public's exposure to excessive noise and safety hazards around airports (SDCRAA n.d.).

Table 4.11-4 San Diego Region's Public, Private, and Military Airports

Airport	Location
Agua Caliente Springs Airport	Northeast of Agua Caliente County Park, Eastern San Diego County
Borrego Valley Airport	Borrego Springs, Eastern San Diego County
Fallbrook Community Airpark	Fallbrook, North San Diego County
Ocotillo Airport	Ocotillo Wells, Eastern San Diego County
Ramona Airport	Ramona, Northeast San Diego County
Gillespie Airport	El Cajon, East San Diego County
McClellan-Palomar Airport	City of Carlsbad, North San Diego County
MCB Camp Pendleton	North San Diego County
Jacumba Airport	Jacumba, East San Diego County
Oceanside Municipal Airport	Oceanside, North San Diego County
Brown Field Municipal	Otay Mesa, South San Diego County
Montgomery Gibbs Executive Airport	Kearney Mesa, City of San Diego
MCAS Miramar	Miramar, City of San Diego
San Diego International	Downtown San Diego, City of San Diego
NOLF Imperial Beach	Imperial Beach, San Diego County
NAS North Island	Coronado, San Diego County

4.11.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

Coastal Zone Management Act

The US Congress passed the 1972 Coastal Zone Management Act (CZMA) (U.S. Code, Title 16, Section 1451 et seq.) to manage the nation's coastal resources. The CZMA is administered by the US Department of Commerce, National Oceanic and Atmospheric Administration's Office of Ocean and Coastal Resource Management. The CZMA balances competing land and water issues in coastal zones through the National Coastal Zone Management Program. Its goal is to preserve, protect, develop, and, where possible, restore or enhance the resources of the nation's coastal zone. Federal activities within or affecting the coastal zone must, to the maximum extent practicable, be consistent with the state's coastal management program (NOAA 2024).

Cleveland National Forest Plan

The US Department of Agriculture's Cleveland National Forest Plan consists of a three-part (vision, strategy, and design criteria) land and resource management plan (forest plan). The legislative mandate for the management of national forests requires that public lands be conservatively used and managed in order to ensure their sustainability and to guarantee that future generations will continue to benefit from their many values. Forest plans are founded on the concept of sustainable use of the national forests. The first part of the plan describes the national forest in the future, the niche it occupies in the community framework, and the desired conditions the Forest Service is striving to realize, as well as the challenges the national forest will resolve in getting there. The second part defines and describes each of the land use zones. The land use zones are an on-the-ground manifestation of the desired conditions and are the primary tools used to describe the strategic direction, including the management intent and suitable uses for areas of the national forest where the zone is used. The final part of the forest plan is the design criteria and constitutes the "rules" that the Forest Service will follow as it implements projects and activities over time (USFS 2005). In March 2011 the Pacific Southwest Region of the Forest Service released a statement of its Leadership Intent for Ecological Restoration, which laid out the region's guiding vision and goals for its stewardship of wildland and forests for the next 15–20 years. This plan reflects the Regional leadership's current thinking on how the Leadership Intent will be implemented (USFS 2018).

Bureau of Land Management Eastern San Diego County Resource Management Plan

The US Bureau of Land Management (BLM) has developed a Resource Management Plan (RMP) for the Eastern San Diego County Planning Area. The RMP covers approximately 102,869 acres of BLM administered lands. The Eastern San Diego County Planning Area spans an area of the eastern portion of Southern California's Peninsular Ranges. Most of the higher land to the west is a part of the Cleveland National Forest, while the low desert region to the east is included in the Anza-Borrego Desert State Park. Riverside County and the United States–Mexico border mark the northern and southern boundaries of the Planning Area, while Imperial County borders it to the east and western San Diego County to the west (BLM 2008).

The purpose of the plan is to provide guidance in the management of the lands and resources in eastern San Diego County that will achieve the following.

1. Address conflicts between motorized, mechanized, and nonmotorized/nonmechanized recreationists.
2. Protect sensitive natural and cultural resources from impacts due to recreational use, livestock grazing, and other land uses.
3. Provide guidance for renewable energy development.
4. Provide groundwater recharge and additional recreational opportunities within the Planning Area.

The Eastern San Diego County RMP is comprehensive in nature, providing guidance for management of all uses and resources in the Eastern San Diego County Planning Area (BLM 2008).

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

Regional Housing Needs Assessment

State law requires that SANDAG consider state housing goals and identify areas within the region sufficient to meet the regional housing needs allocation (RHNA) for the next 8 years. The RHNA is the state-mandated process to identify the total number of housing units (by affordability level) that every city and county must accommodate in Housing Elements.

The RHNA allocates each jurisdiction's "fair share" of the region's projected housing needs over the housing element planning period (2021-2029) for each of four household income groups as compared to the area median income (AMI) and as defined by the California Department of Housing and Community Development (i.e., extremely low-income or less than 30 percent of the AMI, very low-income or less than 50 percent of the AMI, low-income or less than 80 percent of the AMI, and moderate-income or less than 120 percent of the AMI). The RHNA is used by jurisdictions when updating their housing elements as the basis for assuring that adequate sites and zoning are available to accommodate the allocation.

SB 375 requires that the RHNA be consistent with the SCS and that the SCS identify areas sufficient to house the projected regional housing need for the region, since in most of California these documents are both prepared by the same regional organization. To ensure this consistency, SB 375 aligned the RHNA process with the SCS update, which has extended the RHNA and Housing Element update cycle in the SANDAG region from 5 years to 8 years. Because RHNA updates are required every 8 years and MTP/SCS updates are required every 4 years, the SCS and RHNA update process are linked during every other SCS cycle.

California Coastal Act

The California Coastal Act of 1976 (CCA) was enacted to "protect, maintain and where feasible, enhance and restore the overall quality of the coastal zone environment and its natural and artificial resources" (Public Resources Code Section 30001.5 et seq.). The CCA applies to the Coastal Zone, which is generally defined as extending offshore to the limits of California's jurisdiction and from the shoreline 1,000 yards upland from the mean high tide line. The CCA requires each jurisdiction within the Coastal Zone to prepare a local coastal program consisting of land use plans, zoning, and other implementing actions as needed to comply with the policies set forth in CCA Chapter 3. These affect housing and other land uses, coastal access, and public works, including all types of transportation facilities. The coastal cities and the Port District are wholly or partially within the Coastal Zone and are subject to these requirements. The adopted local coastal programs are administered by the local agencies with ultimate approval by the California Coastal Commission (CCC).

Coastal Act policies that are applicable to transportation and land use projects that would implement the Plan include, but are not limited to, the following:

- **Section 30212.5.** Wherever appropriate and feasible, public facilities, including parking areas or facilities, shall be distributed throughout an area so as to mitigate against the impacts, social or otherwise, of overcrowding or overuse by the public of any single area.
- **Section 30213.** Lower cost visitor and recreational facilities shall be protected, encouraged, and where feasible, provided. Developments providing public recreational opportunities are preferred.
- **Section 30221.** Oceanfront land suitable for recreational use shall be protected for recreational use and development unless present and foreseeable future demand for public or commercial recreational activities that could be accommodated on the property is already adequately provided in the area.
- **Section 30222.** The use of private lands suitable for visitor serving commercial recreational facilities designed to enhance public opportunities for coastal recreation shall have priority over private residential, general industrial, or general commercial development, but not over agricultural or coastal-dependent industry.

- **Section 30222.5.** Oceanfront land that is suitable for coastal dependent aquaculture shall be protected for that use, and proposals for aquaculture facilities located on those sites shall be given priority, except over other coastal dependent developments or uses.
- **Section 30223.** Upland areas necessary to support coastal recreational uses shall be reserved for such uses, where feasible.
- **Section 30255.** Coastal-dependent developments shall have priority over other developments on or near the shoreline, except as provided elsewhere in this division, coastal-dependent developments shall not be sited in a wetland. When appropriate, coastal-related development should be accommodated within reasonable proximity to the coastal-dependent uses they support.

California Planning and Zoning Law

The legal framework in which California cities and counties exercise local planning and land use functions is provided in the California Planning and Zoning Law (Government Code Section 65000 et seq.) Under State planning law, each city and county is required to adopt a general plan "for the physical development of the county or city, and any land outside its boundaries which bears relation to its planning" (Government Code Section 65300 et seq.). The California Supreme Court has called the general plan the "constitution for future development" (*Lesher Communications, Inc. v. City of Walnut Creek* [1990] 52 Cal. 3d 531). The general plan expresses the community's development goals and embodies public policy relative to the distribution of future land uses, both public and private. A general plan consists of a number of elements, including land use, circulation, housing, conservation, open space, noise, and safety; other elements may be included at the discretion of the jurisdiction that relate to the physical development of the county or city. The general plan must be comprehensive and internally consistent. Of particular importance is the consistency between the circulation and land use elements; the general location and extent of existing and proposed major thoroughfares, transportation routes, terminals, and other public utilities and facilities must be consistent with the general distribution and intensity of land used for housing, business, industry, open space, education, public areas, waste disposal facilities, agriculture, and other public and private uses.

The Office of Land Use and Climate Innovation (LCI) is statutorily required by Government Code Section 65040.2 to adopt and periodically revise the State General Plan Guidelines for the preparation and content of general plans for all cities and counties in California. The 2017 version of the State General Plan Guidelines includes legislative changes, new guidance, policy recommendations, external links to resource documents, and additional resources (LCI 2017).

A more detailed discussion of the general plans for the individual jurisdictions within the San Diego region is included in Regional and Local Laws, Regulations, Plans, and Policies below. Local jurisdictions may also adopt specific plans, which are used to implement the general plan in particular geographic areas (Government Code Section 65450).

In addition, every local jurisdiction within the region has land use regulations that implement the general plan. The zoning ordinance is the primary land use regulation used to implement the goals and policies of its general plan. Zoning ordinances, which are required to be consistent with the general plan, provide detailed direction related to development standards; permitted, conditionally permitted, and prohibited uses; and other regulations such as parking standards and sign regulations. Zoning ordinances and land use approvals must be consistent with applicable specific plans as well as the general plan.

Cities and counties are also required to comply with the Subdivision Map Act (Government Code Section 66410 et seq.). The Subdivision Map Act sets forth the conditions for approval of a subdivision map and requires enactment of subdivision ordinances by which local governments have direct control over the types of subdivision projects to be approved and the physical improvements to be installed.

Senate Bill 375 (Chapter 728, Statutes of 2008)

Senate Bill (SB) 375 provides for a regional planning process to coordinate land use, housing, and transportation planning to help California meet State greenhouse gas (GHG) emissions reduction targets. SB 375 requires regional transportation plans developed by metropolitan planning organizations, including SANDAG, to incorporate an SCS that demonstrates how the region would achieve regional GHG emissions reduction targets for light duty vehicles set by California Air Resources Board. SB 375 does not require local governments to revise their "land use policies and regulations, including [their] general plan," to be consistent with the SCS (Government Code Section 65080 et seq.) The land use portion of the SCS is implemented through voluntary local government actions.

Local Agency Formation Commission Law

The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (Government Code Section 56000 et seq.) requires that each county must have a local agency formation commission (LAFCO) responsible for creating orderly local government boundaries. The goals of the act include encouraging orderly growth and efficient public services for cities and special districts, preserving prime agricultural and open space lands, and discouraging urban sprawl. While LAFCOs have no direct authority over land use, their actions determine which government agency will be responsible for new planning areas. LAFCOs address a wide range of boundary actions, including creation of spheres of influence for cities, adjustment to boundaries of special districts, annexations, incorporations, detachments of areas from cities, and dissolution of cities.

LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

SANDAG 2021 Regional Plan

SANDAG 2021 Regional Plan is the predecessor to the proposed Plan. The 2021 Regional Plan is the long-term blueprint for the San Diego Region to meet regulatory requirements, address traffic congestion, and create equal access to jobs, education, healthcare, and other community resources. The 2021 Region Plan is the result of planning, data analysis, and community engagement to reimagine the San Diego region with a transformative transportation system, a sustainable pattern of growth and development, and innovative demand and management strategies (SANDAG 2021a). The 2021 Regional Plan also puts forth a forecasted development pattern that is driven by regional goals for sustainability, mobility, housing affordability, and economic prosperity. To achieve the goals of the 2021 Regional Plan, the plan consists of five interdependent strategies, called the 5 Big Moves, designed to address the greatest transportation and mobility challenges for the region: safety and traffic congestion, social inequities, and state and federal requirements to reduce GHG emissions and air pollution.

The 2021 Regional Plan also includes an SCS that integrates coordinated transportation and land use planning that exceeds the state's target for reducing per capita GHG emissions set by the California Air Resources Board. The SCS includes a land use pattern that forecasts growth within Mobility Hubs, which are communities with high concentrations of people, destinations, and travel choices. The Mobility Hubs offer on-demand travel options and supporting infrastructure that enhance connections to high-quality Transit Leap services, while also helping people make short trips to local destinations around the community using Flexible Fleets. Mobility Hubs can span one, two, or a few miles based on community characteristics, and are uniquely designed to fulfill a variety of travel needs while strengthening a sense of place. Additionally, the SCS land use pattern also identified areas within the region that are sufficient to house the 6th Cycle RHNA Plan allocations. The 2021 Regional Plan and its SCS are valid for State compliance, funding eligibility, and other purposes through December 31, 2025.

Airport Land Use Commission and Airport Land Use Compatibility Plans

The California State Aeronautics Act (Public Utilities Code Section 21670 et seq.) directs each county with an airport to establish an ALUC. In each county containing a public use airport, an ALUC is required to assist local agencies in ensuring compatible land uses in the vicinity of existing or proposed airports; to coordinate planning at State, regional, and local levels; to prepare and adopt an airport land use plan as required by Public Resources Code Section 21675; to review plans or regulations submitted by local agencies; and to review and make

recommendations regarding the land uses, building heights, and other issues relating to air navigation safety and promotion of air commerce. The SDCRAA is the ALUC for the San Diego region. It is responsible for the preparation of airport land use compatibility plans (ALUCPs), which identify policies and procedures for land use and airport compatibility for areas surrounding public use and military airports. Local jurisdictions are responsible for land use compatibility controls around the airports.

San Diego Unified Port District – Port Master Plan

The Port Master Plan is the land use document governing the land and water development within the jurisdiction governed by the Port District. It was originally adopted by the Board of Port Commissioners in 1980 and was certified by the CCC on January 21, 1981. The document serves as the governing planning document pursuant to the California Coastal Act for the land and water area within Port District jurisdiction, which extends from the western edge of Pacific Highway coincident with the historic mean high tide line to several hundred feet into San Diego Bay (tidelands). The Port Master Plan divides the tidelands into 10 Planning Districts, or precise plans. Each Planning District is further divided into Planning Subareas, which group together tideland properties into functional units, thereby facilitating planning efforts. The document provides the official planning policies, consistent with a general statewide purpose, for the physical development of the tidelands and submerged lands conveyed and granted in trust to the Port District.

The Port of San Diego is currently updating its Port Master Plan, which is referred to as the Port Master Plan Update (PMPU). The Port certified the Program Environmental Impact Report for the PMPU on February 28, 2024, and anticipates receiving CCC approval in 2025 (San Diego Unified Port District 2025).

General Plans and Land Use Regulations

Every city in the San Diego region, as well as San Diego County, has a general plan that designates appropriate land uses throughout the jurisdiction and identifies the community's land use, circulation, environmental, economic, and social goals and policies as they relate to land use and development. The general plans also provide a basis for local government decision-making, including decisions on development approvals and exactions, and they provide citizens with opportunities to participate in the planning and decision-making processes of their communities. The County of San Diego General Plan focuses on areas not included in city general plans (i.e., unincorporated areas). The current versions of each jurisdiction's general plan, as well as associated updates, are listed in Table 4.11-5. All of these jurisdictions have prepared or are preparing Housing Element (2021–2029) Updates with some completed and others in various stages of the drafting process.

Table 4.11-5 General Plans

Jurisdiction	General Plan	Adoption Date/Updates
Carlsbad	Carlsbad General Plan	September 2015 (Housing Element updated in April 2021, Public Safety Element updated in 2024, Land Use & Community Design Element updated in 2024)
Chula Vista	City of Chula Vista General Plan	December 2005, amended 2021 (Housing Element updated in April 2021, amended in September 2022)
Coronado	Coronado General Plan	November 1986, Revised November 2003 (Housing Element updated in April 2024)
Del Mar	The Community Plan	March 1976, amended 1985 (Housing Element updated in April 2023)
El Cajon	City of El Cajon General Plan 2000	January 2001 (Housing Element updated in July 2021, Environmental Justice Element updated in July 2021, Safety Element updated in 2021)
Encinitas	City of Encinitas General Plan	May 1995 (Housing Element being updated in July 2021, Land Use Element update in September 2024)
Escondido	General Plan	May 2012 (Housing Element being updated as of March 2021, amended in 2023, Safety Element being updated as of June 2025)

Jurisdiction	General Plan	Adoption Date/Updates
Imperial Beach	City of Imperial Beach General Plan/Local Coastal Program Land Use Plan	September 2024 (Housing Element updated in June 2021)
La Mesa	2012 General Plan	July 2013 (Housing Element updated as of April 2023, amended June 2023)
Lemon Grove	General Plan	1996 (Housing Element updated as of December 2023; Comprehensive General Plan update also underway as of 2025)
National City	National City General Plan	June 2011 (Land Use Element updated in March 2024, Safety Element updated in March 2024, Transportation Element updated in March 2024, Housing Element updated in August 2021)
Oceanside	General Plan	June 2002 (Housing Element updated in September 2023; Comprehensive General Plan update also underway as of 2025)
Poway	Poway Comprehensive General Plan	November 1991 (Housing Element updated as of April 2024; Public Safety Element being updated as of June 2025)
City of San Diego	City of San Diego General Plan	July 2024 (Housing Element updated in June 2021)
San Marcos	City of San Marcos General Plan	February 2012 (Housing Element updated as of July 2021; Comprehensive General Plan update also underway as of June 2025)
Santee	City of Santee General Plan	August 2003 (Housing Element updated as of May 2022, Safety and Environmental Justice Element updated in May 2025, Land Use Element update in progress as of June 2025)
Solana Beach	City of Solana Beach General Plan	1988, Amended 2014 (Housing Element updated as of February 2023)
Vista	Vista General Plan 2030	February 2012 (Housing Element updated as of June 2022; Comprehensive General Plan update also underway as of June 2025)
County of San Diego	San Diego County General Plan	August 2011, Amended 2020 (Housing Element updated as of July 2021)

Adopted general plan land use assumptions are used as input to develop SANDAG's regional growth forecast. The forecast is based on the most recent planning assumptions, considering local general plans and other factors, as required by SB 375 (Government Code Section 65080[b][2][B]). Also, every local jurisdiction within the region has land use regulations that implement their general plan, including a subdivision ordinance and zoning ordinance. Zoning ordinances, which are required to be consistent with the general plan, provide detailed direction related to development standards; permitted, conditionally permitted, and prohibited uses; and other regulations such as parking standards and sign regulations.

Local Coastal Plans

Each local jurisdictional authority (city or county) with lands within the coastal zone is required to develop, and comply with a coastal management plan. The Coastal Act requires that any person or public agency proposing development within the Coastal Zone obtain a coastal development permit (CDP) from either the CCC or the city or county having the jurisdictional authority to issue a CDP. To comply with the CZMA, localities develop local coastal plans (LCPs). Table 4.11-6 identifies the local jurisdictions in the San Diego region with coastal zone jurisdiction and Figure 4.11-4 shows the respective Coastal Zone boundaries.

Community Plans and Specific Plans

A city or county may also provide land use planning by developing community or subregional plans, including specific plans for smaller, more specific areas within its jurisdiction. These more localized plans provide for focused guidance for developing a specific area, with development standards tailored to the area, as well as systematic implementation of the general plan. Both the County of San Diego and the City of San Diego have numerous community and specific plans. A community plan is used to plan the future of a particular area to a finer level of detail than the general plan and supplements the policies of the general plan; however, these community and specific plans must be consistent with the jurisdiction's general plan. All of the jurisdictions within the San Diego region have developed and implemented numerous specific plans that delineate land uses, infrastructure, development standards and criteria, and environmental conservation measures.

To support the preparation of the analysis in Section 4.11.4, "Environmental Impacts and Mitigation Measures," SANDAG worked closely with each jurisdiction to gather information about adopted community plans and specific plans that have yet to be implemented to assess whether the proposed Plan has any inconsistencies with these plans, per State CEQA Guidelines Section 15125(d). Each jurisdiction compiled a list of adopted plans not yet fully implemented. Information as to the type of development allowed, buildout assumptions, development completed to date, and the buildout year of each plan was provided. A comprehensive table of community and specific plan information by jurisdiction is included in Appendix K.

4.11.3 Significance Criteria

Appendix G of the State CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts, in the form of Initial Study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the checklist questions in Appendix G. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR and the unique characteristics of the proposed Plan.

Checklist questions for Land Use and Planning are included in Section XI (a and b) of Appendix G of the State CEQA Guidelines. Appendix G criterion XI (a) is addressed in LU-1 and criterion XI (b) is addressed in LU-2. For the purposes of this EIR, implementation of the proposed Plan would have a significant land use and planning impact if it would:

LU-1 Physically divide an established community.

LU-2 Cause a significant environmental impact due to a conflict with any land use plan, policy or regulation (including, but not limited to, the general plan, local coastal program, or zoning ordinance) and result in a physical change to the environment not already addressed in the other resource chapters of this EIR.

The analysis discloses impacts to land use and planning. There is insufficient evidence to support a meaningful analysis of how the proposed Plan's land use and planning impacts would be worsened by climate change. Therefore, a climate change analysis for land use and planning impacts is not included in this section.

4.11.4 Environmental Impacts and Mitigation Measures

LU-1 PHYSICALLY DIVIDE AN ESTABLISHED COMMUNITY

Analysis Methodology

This analysis examines how regional growth and land use or transportation network improvements and programs under the proposed Plan could physically divide established communities. Forecasted regional growth that occurs in new developments outside of established communities would, by definition, not physically divide established communities, and is not addressed further under Impact LU-1. For regional growth and land use change, the analysis focuses on development within established communities.

The analysis focuses on whether the proposed Plan would introduce land uses that would result in the disruption of the physical arrangement of an existing neighborhood such that a physical separation or the creation of a barrier could disrupt the physical interaction between established land uses that comprise a neighborhood or community. The potential for community disruption was assessed by evaluating the location of substantial land use density increases in relation to established communities. A review of existing land use mapping was conducted to evaluate how the proposed Plan would affect land use patterns and the development of currently vacant and open space lands. Regional growth and land use change are analyzed based on areas with the greatest projected land use changes in term of projected population, jobs, densities, and land uses by location. The analysis also considers impacts by area to determine (1) the general amount and type of land that might be impacted, and (2) where impacts may be concentrated.

The analysis of transportation network improvements and programs considers whether new or expanded transportation projects or improvements under the proposed Plan would physically divide established communities. Increased frequencies on existing rail corridors and bus routes, new bus service on existing roadways, and transportation program investments (e.g., more flexible fleet options, Managed Lane Connectors, direct access ramps) under the proposed Plan would not physically divide established communities and are not addressed further under Impact LU-1. The analysis consists of a review of existing land use maps to evaluate the location of proposed major transportation network improvements and programs in relation to surrounding land uses and community development. The transportation network improvements and services considered include those that have the potential for physical impacts based on characteristics such as expansion, widening, new construction, or new configurations.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Physical barriers such as freeways and highways, rail lines, major heavy industrial uses, and large institutional land uses such as military facilities often form the boundaries of existing established communities in the region and also internally divide existing established communities. For example, the major interstate highways form large physical barriers that divide several established communities throughout the region, and large institutional facilities like military facilities and the San Diego Convention Center separate established communities from the San Diego Bay. The established communities of the region generally feature extensive, interconnected roadway networks. Implementation of the land use change would result in future development being integrated into existing communities along the existing transportation network and would, therefore, not physically divide established communities.

Adopted general plans and subregional or community plans for established communities routinely prevent developments that would physically divide established communities, and often include policies to remove existing physical barriers. For example, the community plan for Downtown San Diego includes policies to re-connect streets historically divided by large-scale developments and neighborhoods physically divided by the construction of I-5 (City of San Diego 2006). The proposed Plan forecasts regional growth within established communities such as the city of San Diego and Chula Vista and along key transportation corridors. The development of new housing units and employment land uses within existing established communities would typically occur on vacant or underutilized sites such as surface parking lots, low-rise commercial strips, industrial buildings, and warehouses and would also result from the conversion of low-density single-family housing properties to multifamily residences. The proposed Plan would serve to promote connectivity within an existing community by siting land uses of similar character and nature in a more compact and mixed-use pattern. Thus, it is reasonably foreseeable that the pattern of regional growth and development would result in beneficial impacts related to the connectivity of an existing community, rather than an adverse effect. Moreover, infill development in established communities would occur in accordance with the adopted general plans and other subregional or community plans of the cities and County of San Diego, as well as their zoning and subdivision ordinances.

Construction activities associated with development involve temporary disruptions within established communities such as lane or road closures and service delays or detours for bus routes. Local jurisdictions routinely require traffic control plans and related measures to ensure that construction activities accommodate vehicular, bicycle, and pedestrian access, such as designating alternate routes or scheduling disruptive activities late at night or on weekends. Without such traffic control plans and related measures, these activities could temporarily physically divide a community by eliminating access routes or introducing barriers during construction. With implementation of these plans and measures, however, construction activities would not result in the physical division of established communities.

Based on the above analysis, regional growth and land use change for 2035 would not physically divide an established community. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. While portions of these improvements to existing transportation facilities may involve temporary or permanent right-of-way acquisitions adjacent to existing facilities, the improvements to existing facilities or within existing public rights-of-way would not physically divide established communities because improvements do not include components such as the construction of a new roadway or railway within an existing community. The planned rail grade separation at certain locations on the SPRINTER, Green line, Blue Line, and Orange Trolley lines would improve connections between communities currently physically divided by rail lines. Based on the above analysis, implementation of transportation network improvements would not physically divide an established community. This impact is less than significant.

2035 Conclusion

Implementation of transportation network improvements, regional growth and land use change, would not physically divide established communities. Therefore, this impact (LU-1) in the year 2035 is less than significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Chapter 2, "Project Description," of this Draft EIR, from 2036 to 2050, the regional population is forecasted to decrease by 4,112 people (-0.1%), housing is forecast to increase by 65,577 units (4.8%), and employment is forecasted to increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, Carlsbad and El Cajon. Approximately 78.8% of new housing units are in the cities of San Diego (51.6%), and Chula Vista (17.1%), and the unincorporated jurisdictions. Similarly, these same three jurisdictions contribute to approximately 70.3% of new jobs between 2036 and 2050.

As described in the 2035 analysis, physical barriers such as freeways and highways, rail lines, major industrial uses, and large institutional land uses such as military facilities often form the boundaries of existing established communities in the region, and also internally divide existing established communities. The established communities of the region generally feature extensive, interconnected roadway networks. The proposed Plan forecasts regional growth within established communities such as the city of San Diego and Chula Vista and along key transportation corridors. The development of new housing units and employment land uses within these established communities would typically occur on vacant or underutilized sites such as surface parking lots, and low-density residential properties, low-rise commercial strips, industrial buildings, and warehouses. The proposed Plan would serve to promote connectivity within an existing community by siting land uses of similar character and nature in a more compact and mixed-use pattern. Thus, it is reasonably foreseeable that the pattern of regional growth and development would result in beneficial impacts related to the connectivity of an existing community, rather than an adverse effect. Moreover, infill development in established communities would occur in accordance with the adopted general plans and other subregional and community plans of the cities and County of San Diego, as well as their zoning and subdivision ordinances. Adopted general plans and subregional and community plans for established communities routinely prevent development that would physically divide established communities, and often include policies to remove existing physical barriers.

Construction activities associated with development involve temporary disruptions within established communities such as lane or road closures and service delays or detours for bus routes. Local jurisdictions routinely require traffic control plans and related measures to ensure that construction activities accommodate vehicular and pedestrian access, such as designating alternate routes or scheduling disruptive activities late at night or on weekends. Without such traffic control plans and related measures, these activities could temporarily physically divide a community by eliminating access routes or introducing barriers during construction. With implementation of these plans and measures, however, construction activities would not result in the physical division of established communities. Based on the above analysis, regional growth and land use changes would not physically divide an established community in year 2050. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period.

Between 2036 and 2050, most transportation network improvements would affect existing transportation facilities, such as SPRINTER, Blue Line, Green Line, and Orange Line Trolley line station enhancements; rail grade separations; managed lanes, managed lane connectors, and direct access ramps along existing freeways and highways; improvements to regional arterials; and active transportation projects. While portions of these improvements to existing transportation facilities would likely involve temporary or permanent right-of-way acquisitions adjacent to existing facilities, the improvements to existing facilities or within existing public rights-of-way would not physically divide established communities. The planned rail grade separation on the SPRINTER,

Blue Line, Green Line, and Orange Trolley lines would improve connections between communities currently physically divided by rail lines.

Other planned transportation network improvements may require acquisition of new rights-of-way in highly developed established communities, such as the SPRINTER extension to North County Mall. The future alignments and engineering designs for this rail extension have not yet been determined, but are likely to be located, to the extent feasible, along existing freeways, roadways, and rail corridors in order to minimize costs associated with property acquisition and reduce impacts on owners of private property, including businesses and residents. Some segments of future rail extensions could have alignments and design features that physically divide established communities. Where applicable, these individual transportation network improvements would undergo separate environmental review under CEQA and National Environmental Policy Act (NEPA). The corresponding project-specific environmental documentation would identify significant impacts with regard to the physical division of established communities, if any, and identify mitigation measures to avoid or lessen the impact. Because the exact location of future rail extensions are unknown at this time, project-level physical division of established community impacts associated with planned commuter rail extensions may not be able to be avoided or substantially lessened. Therefore, transportation network improvements could physically divide established communities by 2050. This is a significant impact.

2050 Conclusion

Implementation of transportation network improvements, but not regional growth and land use change, could physically divide established communities. Therefore, this impact (LU-1) in the year 2050 is significant.

MITIGATION MEASURES

LU-1 PHYSICALLY DIVIDE AN ESTABLISHED COMMUNITY

2050

LU-1a Provide Access and Connections for Transportation Network Improvements.

During planning, design, and project-level CEQA review of transportation network improvements, including new rail extensions and roadway widening improvements, SANDAG shall, and other transportation project sponsors can and should, design new transportation network improvements within established communities to avoid the creation of barriers that physically divide such communities. Where avoidance is not feasible, measures to reduce the creation of barriers that physically divide such communities should be considered, including but not limited to, the following:

- Selecting alignments within or adjacent to existing public rights-of-way.
- Designing sections above- or below-grade to avoid or reduce physical division of communities, where feasible.
- Providing direct crossings, overcrossings, or undercrossings at regular intervals for various modes of travel (e.g., pedestrians/bicyclists, vehicles).

SIGNIFICANCE AFTER MITIGATION

2050

Implementation of mitigation measure LU-1a would reduce impacts regarding the physical division of established communities associated with transportation network improvements through implementation of feasible alignments, design options, and other design features that avoid or substantially reduce impacts on community division. However, there is no guarantee that the impact would be reduced to less-than-significant levels for all projects. Therefore, the physical division of established communities resulting from transportation network improvements would remain significant and unavoidable.

LU-2 CAUSE A SIGNIFICANT ENVIRONMENTAL IMPACT DUE TO A CONFLICT WITH ANY LAND USE PLAN, POLICY OR REGULATION (INCLUDING, BUT NOT LIMITED TO, THE GENERAL PLAN, LOCAL COASTAL PROGRAM, OR ZONING ORDINANCE) AND RESULT IN A PHYSICAL CHANGE TO THE ENVIRONMENT NOT ALREADY ADDRESSED IN THE OTHER RESOURCE CHAPTERS OF THIS EIR

Analysis Methodology

The land use and planning analysis describes existing land use and zoning as well as regional and local land use plans, policies, or regulations, and is intended to help fulfill the requirements of CEQA Guidelines Section 15125(d). The analysis also describes changes in the land use due to the forecasted regional growth and land use change and planned transportation network improvements under the proposed Plan. The emphasis of the analysis is on plan consistency and potential conflicts between the proposed Plan and existing land use plans, policies, and regulations adopted to avoid or mitigate environmental effects.

The proposed Plan is considered consistent with the provisions of the identified regional and local plans if it meets the general intent of the applicable land use plans. Subregional plans that have been adopted by local jurisdictions are identified in Appendix K to this EIR. A given project need not be in perfect conformity with each and every policy nor does State law require precise conformity of a proposed project with every policy or land use designation for a site. Courts have recognized that general and specific plans attempt to balance a range of competing interests. It follows that it is nearly, if not absolutely, impossible for a project to be in perfect conformity with each and every policy set forth in the applicable plan. If the proposed Plan is determined to be inconsistent with specific individual objectives or policies of an applicable plan but is largely consistent with the land use or the other goals and policies of that plan and would not preclude the attainment of the primary intent of the land use plan, the proposed Plan would not be considered inconsistent with the plan. Furthermore, in this impact analysis, any such inconsistency would also have to result in a new physical change in the environment, not analyzed in the other resource chapters of this EIR, to result in a significant environmental impact. The discussion below provides a brief overview of the most relevant policies and development standards from the various planning documents. However, the proposed Plan's consistency conclusions are based upon the planning documents as a whole.

As described in Appendix F of the proposed Plan, the SCS land use pattern establishes a growth and development pattern that accommodates the RHNA Determination, ensuring sufficient housing capacity, and reflects the most recent planning assumptions, incorporating local land use policies and conditions. SANDAG collaborated with all 19 regional jurisdictions, including the 18 cities and the County of San Diego to develop the SCS land use pattern. This process involved holding a series of meetings to review and verify the parcel-level capacity data. The housing capacity data described in Appendix F of the proposed Plan reflects development potential and guides the allocation of forecast totals to subregional areas. During the process of developing the SCS land use pattern, it became clear that adjustments were needed for the cities of Coronado and Solana Beach, where initial housing build-out estimates were below the cities' proposed or adopted Housing Elements. For both cities, the build-out estimate for each city's adopted Housing Element was used to accommodate their 6th Cycle RHNA allocations. Therefore, the proposed land uses for the Plan are consistent with the local jurisdictions' Housing Elements.

Conflicts with land use portions of adopted general plans, local coastal programs, the Port Master Plan, or other applicable subregional plans, such as specific plans and community plans, are generally analyzed in this section. Conflicts with resource-specific plans, policies, or regulations are analyzed in the respective EIR sections. For example, consistency with ALUCPs is addressed in Sections 4.9, "Hazards and Hazardous Materials," and 4.13, "Noise and Vibration," and consistency with habitat conservation plans is addressed in Section 4.4, "Biological Resources."

For regional growth and land use change, the impact analysis uses SANDAG's forecasted growth rates as described in Chapter 2, "Project Description," to analyze forecasted development based on the SCS land use pattern throughout the region as projected under the proposed Plan, including new growth in existing urbanized areas. Land use plans, policies, and regulations by jurisdiction are considered generally and describe how the

proposed Plan may shape future development patterns that, as a consequence of the proposed Plan's implementation, might cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation that was established to avoid or mitigate an environmental effect.

Regional growth and land use change and planned transportation network improvements within federal lands would generally be consistent with the planning strategies outlined by the Cleveland National Forest Plan and the Eastern San Diego County RMP. Because regional growth and land use change and expansion of the transportation network within federal lands are generally restricted, conflicts with these existing plans would be avoided and, therefore, are not evaluated further.

The analysis of transportation network improvements focuses on the proposed Plan's new infrastructure or facilities that may conflict with adopted local land use plans, policies, or regulations. Improvements and programs involving only operational changes would not substantially affect local land use plans, policies, or regulations, and therefore are not evaluated further. Spatial analysis is used to evaluate location of large-scale transportation projects and their consistency with local land use plans, policies, or regulations.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1 in Chapter 2, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted to have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

The forecasted development of the proposed Plan is based on the Series 15 Regional Growth Forecast SCS land use pattern, which is, in turn, based on the adopted general plans of the cities and County of San Diego and on the most recent planning assumptions, considering local general plans and other factors, as required by SB 375 (Government Code Section 65080[b][2][B]). Local coastal programs are components of local general plans. The Regional Growth Forecast is described in detail in Appendix F of the proposed Plan.

SANDAG's 6th Cycle RHNA Plan is integrated into the proposed Plan's SCS land use pattern and is consistent with updated (6th Cycle, 2021–2029) Housing Elements. As required by state law, all jurisdictions' 6th Cycle (2021–2029) Housing Element updates have been completed. Subregional plans, such as community or specific plans, are required to be consistent with adopted general plans. Because the proposed Plan is based on adopted general plans, the proposed Plan would not conflict with subregional plans. As described in Appendix F of the proposed Plan, SANDAG collaborated with all 19 regional jurisdictions, including the 18 cities and the County of San Diego. Development patterns would focus more residential, commercial, and office uses in existing urban areas; growth in the unincorporated areas would be focused within existing rural communities. These development patterns, which would be served by transit capital projects, improvements in transit service, and active transportation projects, are consistent with local land use plans, policies, and subregional plans in urban areas.

Therefore, the SCS land use pattern between 2022 and 2035 would not conflict with land use plans, policies, and regulations, including general plans, local coastal programs, specific plans, and community plans, adopted for the purpose of avoiding or mitigating an environmental effect. This impact is less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as

interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

The planned transportation improvements may require the acquisition of public rights-of-way not currently captured in all of the plans and projects in local jurisdictions. However, SANDAG's planned transportation network improvements for 2035 are intended to improve the transportation network in a manner that will efficiently serve the projected regional growth,, manage congestion, provide transportation options for residents, improve safety, and provide a plan for achieving SANDAG's state-mandated target to reduce regional emissions of GHGs. Transportation improvements are included for their potential to provide multimodal benefits, improve safety, alleviate existing or forecasted bottlenecks, connect housing to jobs, and meet future projected travel volumes in a way that manages, rather than eliminates, congestion.

However, it cannot be guaranteed that all planned rail improvements would have alignments and design features that would avoid land use conflicts with adopted plans. Individual rail improvements, such as improvements to Regional Rail 398, would undergo separate environmental review under CEQA and NEPA, where applicable. The corresponding project-specific environmental documentation would identify significant impacts with regard to conflicts with land use portions of adopted plans, if any, and identify mitigation measures to avoid or lessen significant physical impacts on the environment resulting from any conflicts.

Nevertheless, it cannot be concluded that all project-level conflicts would be avoided or substantially lessened. Therefore, transportation network improvements in year 2035 would conflict with land use plans, policies, and regulations, including general plans, specific plans, and community plans, adopted for the purpose of avoiding or mitigating an environmental effect. However, the impacts of transportation network improvements are already evaluated in other sections of this EIR, so these conflicts would not cause new significant impacts. Therefore, this impact is less than significant.

2035 Conclusion

Implementation of regional growth and land use change and transportation network improvements would not conflict with land use plans, policies, and regulations, including general plans, local coastal programs, specific plans, and community plans, adopted for the purpose of avoiding or mitigating an environmental effect, and would not result in a physical change to the environment not already addressed in the other resource chapters of this EIR. Further environmental impacts associated with policy conflicts are already evaluated in other sections of this EIR. Therefore, this impact (LU-2) in the year 2035 is less than significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Chapter 2, "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units are in the Cities of San Diego (51.6%), Chula Vista (17.1%), and the unincorporated jurisdictions. Similarly, these same three jurisdictions contribute to approximately 70.3% of new jobs between 2036 and 2050.

As described above, SANDAG's 6th Cycle RHNA Plan is integrated into the proposed Plan's SCS land use pattern and is consistent with updated (6th Cycle, 2021–2029) Housing Elements. Because the proposed Plan is based on adopted general plans, the proposed Plan would not conflict with subregional plans. As described in Appendix F of the proposed Plan, SANDAG collaborated with all 19 regional jurisdictions, including the 18 cities and the County of San Diego. Development patterns would focus more residential, commercial, and office uses in existing

urban areas; growth in the unincorporated areas would be focused within existing rural communities. These development patterns, which would be served by transit capital projects, improvements in transit service, and active transportation projects, are consistent with local land use plans, policies. The proposed Plan's focus on development in the urbanized western portions of the San Diego region is also consistent with the planning goals of smaller rural communities in the eastern portion of the region to maintain a more rural, nonurbanized character.

Therefore, regional growth and land use change between 2036 and 2050 would not conflict with land use plans, policies, and regulations, including general plans, local coastal programs, specific plans, and community plans, adopted for the purpose of avoiding or mitigating an environmental effect. This impact is less than significant.

Transportation Network Improvements and Programs

In 2050, most transportation network improvements would affect existing transportation facilities, such as SPRINTER, Blue, Orange, and Green Trolley line station enhancements; rail grade separations; managed lanes, managed lane connectors, and direct access ramps along existing freeways and highways; improvements to regional arterials; and active transportation projects.

The planned transportation improvements may require the acquisition of public rights-of-way not currently captured in all of the plans and projects of local jurisdictions. However, SANDAG's planned transportation network improvements for 2050 are intended to improve the transportation network in a manner that will efficiently serve the projected regional growth (including in local jurisdictions), manage congestion, provide transportation options for residents, improve safety, and to provide a plan for achieving SANDAG's state-mandated target to reduce regional emissions of GHGs. Transportation improvements are included for their potential to provide multimodal benefits, improve safety, alleviate existing or forecasted bottlenecks, connect housing to jobs, and meet future projected travel volumes in a way that manages, rather than eliminates, congestion.

However, it cannot be guaranteed that all planned rail improvements would have alignments and design features that would avoid land use conflicts with adopted plans. Individual rail improvements, such as improvements to Regional Rail 398 and the SPRINTER extension to North County Mall, would undergo separate environmental review under CEQA and NEPA, where applicable. The corresponding project-specific environmental documentation would identify significant impacts with regard to conflicts with land use portions of adopted plans, if any, and identify mitigation measures to avoid or lessen significant physical impacts on the environment resulting from any conflicts.

Nevertheless, it cannot be concluded that all project-level conflicts would be avoided or substantially lessened. Therefore, transportation network improvements in year 2050 would conflict with land use plans, policies, and regulations, including general plans, specific plans, and community plans, adopted for the purpose of avoiding or mitigating an environmental effect. However, the impacts of transportation network improvements are already evaluated in other sections of this EIR, so these conflicts would not cause new significant impacts. Therefore, this impact is less than significant.

2050 Conclusion

Implementation of regional growth and land use change and transportation network improvements would not likely conflict with local jurisdictions' land use plans, including general plans, specific plans, local coastal programs, and community plans, and would not result in a physical change to the environment not already addressed in the other resource chapters of this EIR. Further, impacts related to conflicts with individual policies associated with environmental protection and mitigation are already evaluated in other sections of this EIR. Therefore, this impact (LU-2) in the year 2050 is less than significant.

MITIGATION MEASURES

No mitigation measures are required for this impact.

4.11.5 Cumulative Impacts Analysis

C-LU-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE IMPACTS RELATED TO LAND USE AND PLANNING.

This section discusses the cumulative effects of past, present, and reasonably foreseeable future projects and the contribution of regional growth and land use change and transportation network improvements and programs included in the proposed Plan to these effects. The geographic scope for the cumulative land use and planning analysis is the Southern California region. While land uses and development patterns are typically established in local land use planning documents specific to jurisdictions, it is important to consider land use change and how the transportation system would influence the development pattern across the Southern California region as a whole because land uses merge and flow together along jurisdictional boundaries. A wide variety of land use patterns and development types can be found throughout the Southern California region including urban and rural development, commercial and industrial developments, military installations, tribal reservations, agricultural land, parks and open space, and habitat conservation areas.

The cumulative impact is the combination of the land use and planning impacts of the proposed Plan, land use impact projections in adopted plans, and impacts on land use resulting from substantial regional projects. Significant cumulative impacts related to land use would occur if established communities are physically divided, or if conflicts are created with land use plans adopted for the purpose of avoiding or mitigating an environmental effect.

This cumulative land use and planning impact assessment considers and relies on the impact analysis presented in the Southern California Association of Governments (SCAG) 2024-2050 RTP/SCS and its EIR (SCAG 2024a, 2024b). The SCAG 2024-2050 RTP/SCS and associated EIR generally encompass Imperial, Orange, San Bernardino, Riverside, Los Angeles, and Ventura counties. The San Diego County General Plan and its EIR (County of San Diego 2011) was used to consider land use effects within San Diego County. Additionally, multiple agencies and jurisdictions have land use control throughout the region, including local cities and counties, numerous military branches, tribal governments, state and federal agencies, port authorities, and airport authorities that outline their policies in various planning documents.

Impacts of the Proposed Plan

The land use patterns outlined in the proposed Plan focus greater development intensity in existing urban centers. The proposed Plan provides a strategy to accommodate population, housing, and job growth in such a way as to achieve consistency with regional planning and the SCS requirements. The pattern of more intensive land uses, along with the transit improvements is intended to accommodate regional growth in urban communities. Therefore, land use changes under the proposed plan would not physically divide an established community. However, transportation network improvements, such as new commuter rail extensions into previously unserved areas, could in some locations result in a physical division of an established community in 2050 (Impact LU-1).

Regional growth forecasted and development patterns that would occur under the proposed Plan would be consistent with applicable land use plans. During preparation of the proposed Plan, SANDAG aligned the SCS land use pattern with relevant local general plans, community plans, specific plans, and development constraints. Transportation network improvements in 2035 and 2050 would conflict with land use plans, policies, and regulations, including general plans, specific plans, and community plans, adopted for the purpose of avoiding or mitigating an environmental effect. However, the impacts of transportation network improvements are already evaluated in other sections of this EIR, so these conflicts would not cause new significant impacts. Therefore, the proposed Plan would not cause a significant environmental impact due to a conflict with any land use plan, policy or regulation and result in a physical change to the environment not already addressed in the other resource chapters of this EIR (Impact LU-2).

Impacts of Related Projects

Projects planned in the Southern California region, such as the California High Speed Rail Train (HST), airport expansions in the San Diego region, or long linear projects such as rail pipeline or energy transmission infrastructure, would result in impacts related to the physical division of established communities. For example, the HST project in the San Diego region would result in property acquisition along existing rights of way and some acquisition along new rights of way in undeveloped areas, resulting in significant displacement and land use compatibility impacts (HSRA 2005).

Projects planned in the Southern California region, such as the HST, airport expansions in the San Diego region, or long linear projects such as rail pipeline or energy transmission infrastructure, would result in impacts related to conflicts with adopted general plans or other applicable land use plans. For example, the HST project in the San Diego region would result in property acquisition along existing rights-of-way and some acquisition along new rights-of-way in undeveloped areas, resulting in land use compatibility impacts (HSRA 2005). The EIR/Environmental Impact Statement (EIS) prepared for the HST project determined that the project would result in significant cumulative impacts on land use. The EIR for the SDIA Airport Development Plan identified significant land use impacts due to conflict with certain aspects of land use plans, policies or regulations adopted for the purpose of avoiding or mitigating an environmental effect. The project would generate future noise and traffic impacts that are in conflict with certain community plans and policies, resulting in significant and unavoidable impacts (SDIA 2019).

The EIS for the Navy OTC Revitalization Project evaluated several alternatives and determined that the project would result in increased density under several alternative options that would contribute to significant additional proposed growth in dwelling units, population, jobs, and non-residential uses over the targets contained in the applicable community plan (US Navy 2021).

Impacts of Projections in Adopted Plans

The SCAG 2024-2050 RTP/SCS EIR found that implementation of the Connect SoCal 2024 Plan has the potential to physically divide an established community (SCAG 2024b). The County of San Diego General Plan Update EIR identified a less than significant cumulative impact associated with the physical division of an established community due to future roadway development under the proposed General Plan Update, including new roads, road extensions, and widening of existing roads throughout the county (County of San Diego 2011).

Land use impacts are typically isolated to a jurisdiction, except where land uses may interact or conflict with land uses in adjacent jurisdictions. Growth and development within the cumulative impact analysis area could result in a cumulative land use impact if the development is inconsistent with applicable land use plans or policies. The SCAG 2024-2050 RTP/SCS EIR found that implementation of the Connect SoCal 2024 Plan has the potential to conflict with existing land use plans (SCAG 2024b). The County of San Diego General Plan Update EIR identified a less than significant cumulative impact associated with the physical division of an established community due to future roadway development under the proposed General Plan Update, including new roads, road extensions, and widening of existing roads throughout the county. The EIR found that the General Plan Update would not contribute to a significant cumulative impact associated with conflicts with local plans, policies, and regulations (County of San Diego 2011).

Cumulative Impacts and Impact Conclusions

2035

Physically Divide an Established Community

A significant cumulative impact in the year 2035 would result if the combined impacts of the proposed Plan and direct land use impacts of adopted plans and related projects described above, including the HST, SCAG 2024-2050 RTP/SCS and the County of San Diego General Plan Updated were significant when considered together. As discussed above, regional growth and land use change and implementation of the transportation network improvements in the proposed Plan would not result in the division of established communities or conflict with

land use plans in 2035. Although cumulative impacts related to the physical division of an established community would be significant, the proposed Plan's contribution would be less than significant and would not be cumulatively considerable.

Conflict with any Land Use Plan, Policy or Regulation

A significant cumulative impact in the year 2035 would result if the combined impacts of the proposed Plan and impact projections from adopted plans within the Southern California region were significant when considered together. As described above, the proposed Plan would not conflict with land use plans in 2035. Although cumulative land use impacts throughout the Southern California region by 2035 would be significant, the proposed Plan's contribution would be less than significant and not be cumulatively considerable.

2050

Physically Divide an Established Community

As discussed above, implementation of the transportation network improvements in the proposed Plan would result in the division of established communities and conflict with land use plans in 2050. The combination of the direct land use impacts from the proposed Plan together with impacts of the adopted plans and related projects described above, including the HST, SCAG 2024-2050 RTP/SCS and the County of San Diego General Plan Update would result in significant cumulative land use impacts regarding the division of an established community by 2050. Therefore, the proposed Plan would contribute to cumulative impacts related to the physical division of an established community (Impact C-LU-1).

Conflict with any Land Use Plan, Policy or Regulation

As described above, implementation of the proposed Plan would not conflict with land use patterns of adopted general plans or other applicable land use plans in 2050. The 2050 time period is beyond the planning horizon of the adopted 2024-2050 SCAG RTP/SCS, and the County General Plan Update does not specify a planning horizon date. However, with anticipated long-term growth and development throughout the region, it can be expected that similar land use and planning impacts would continue throughout the planning area. Although cumulative land use impacts throughout the Southern California region by 2050 would be significant, the proposed Plan's contribution would be less than significant and not be cumulatively considerable.

MITIGATION MEASURES

C-LU-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO LAND USE AND PLANNING

2050

Mitigation measure LU-1a intended to reduce land use impacts due to transportation improvements in 2050 would be applicable to cumulative land use impacts. Mitigation measure LU-1 requires project-level CEQA review of transportation network improvements to avoid the creation of barriers that physically divide established communities. Implementation of mitigation measure LU-1a would not guarantee reduction of proposed Plan impacts associated with physically dividing established communities to a less-than-significant level. Therefore, the proposed Plan's incremental contributions to the cumulative land use impacts in 2050 would remain cumulatively considerable post-mitigation.

4.12 MINERAL RESOURCES

This section evaluates the potential mineral resources impacts of the proposed Plan.

4.12.1 Existing Conditions

SAN DIEGO REGION MINERAL RESOURCES

Mineral resources in the San Diego region serve various public, commercial, scientific, and recreational purposes. The term "mineral resources" refers to a concentration of naturally occurring minerals in a form and amount that make economic extraction potentially feasible (SMGB 2024). Locally important mineral resources in the San Diego region include construction aggregate materials (sand, gravel, and crushed rock), industrial and chemical mineral materials (limestone, dolomite, and marble), and metallic and rare materials (precious metals, gemstones, iron and other ferro-alloy metals, copper, lead, zinc, and optical-grade calcite) (County of San Diego 2011). These finite resources are each important to the region's economy, but due to the importance of aggregate materials in construction of vital infrastructure, aggregate materials are the most economically important mineral category. Other mineral resources in the San Diego region include the Pala Gem Mining District, which is on land governed by the Pala Band of Mission Indians (Hudson Institute of Mineralogy 2024); granite and marble dimension stone used for buildings and countertops; and a variety of industrial and chemical minerals, such as ash, boron, and clay.

The location of mineral resources is related to the geologic environments in which certain mineral deposits were formed. In the San Diego region, deposits formed during the Quaternary, Tertiary, and Cretaceous periods can be the source of mineral resources (County of San Diego 2011). For example, Quaternary alluvium is a source of sand and gravel that can be mined and processed to produce construction aggregate (Dudek 2020).

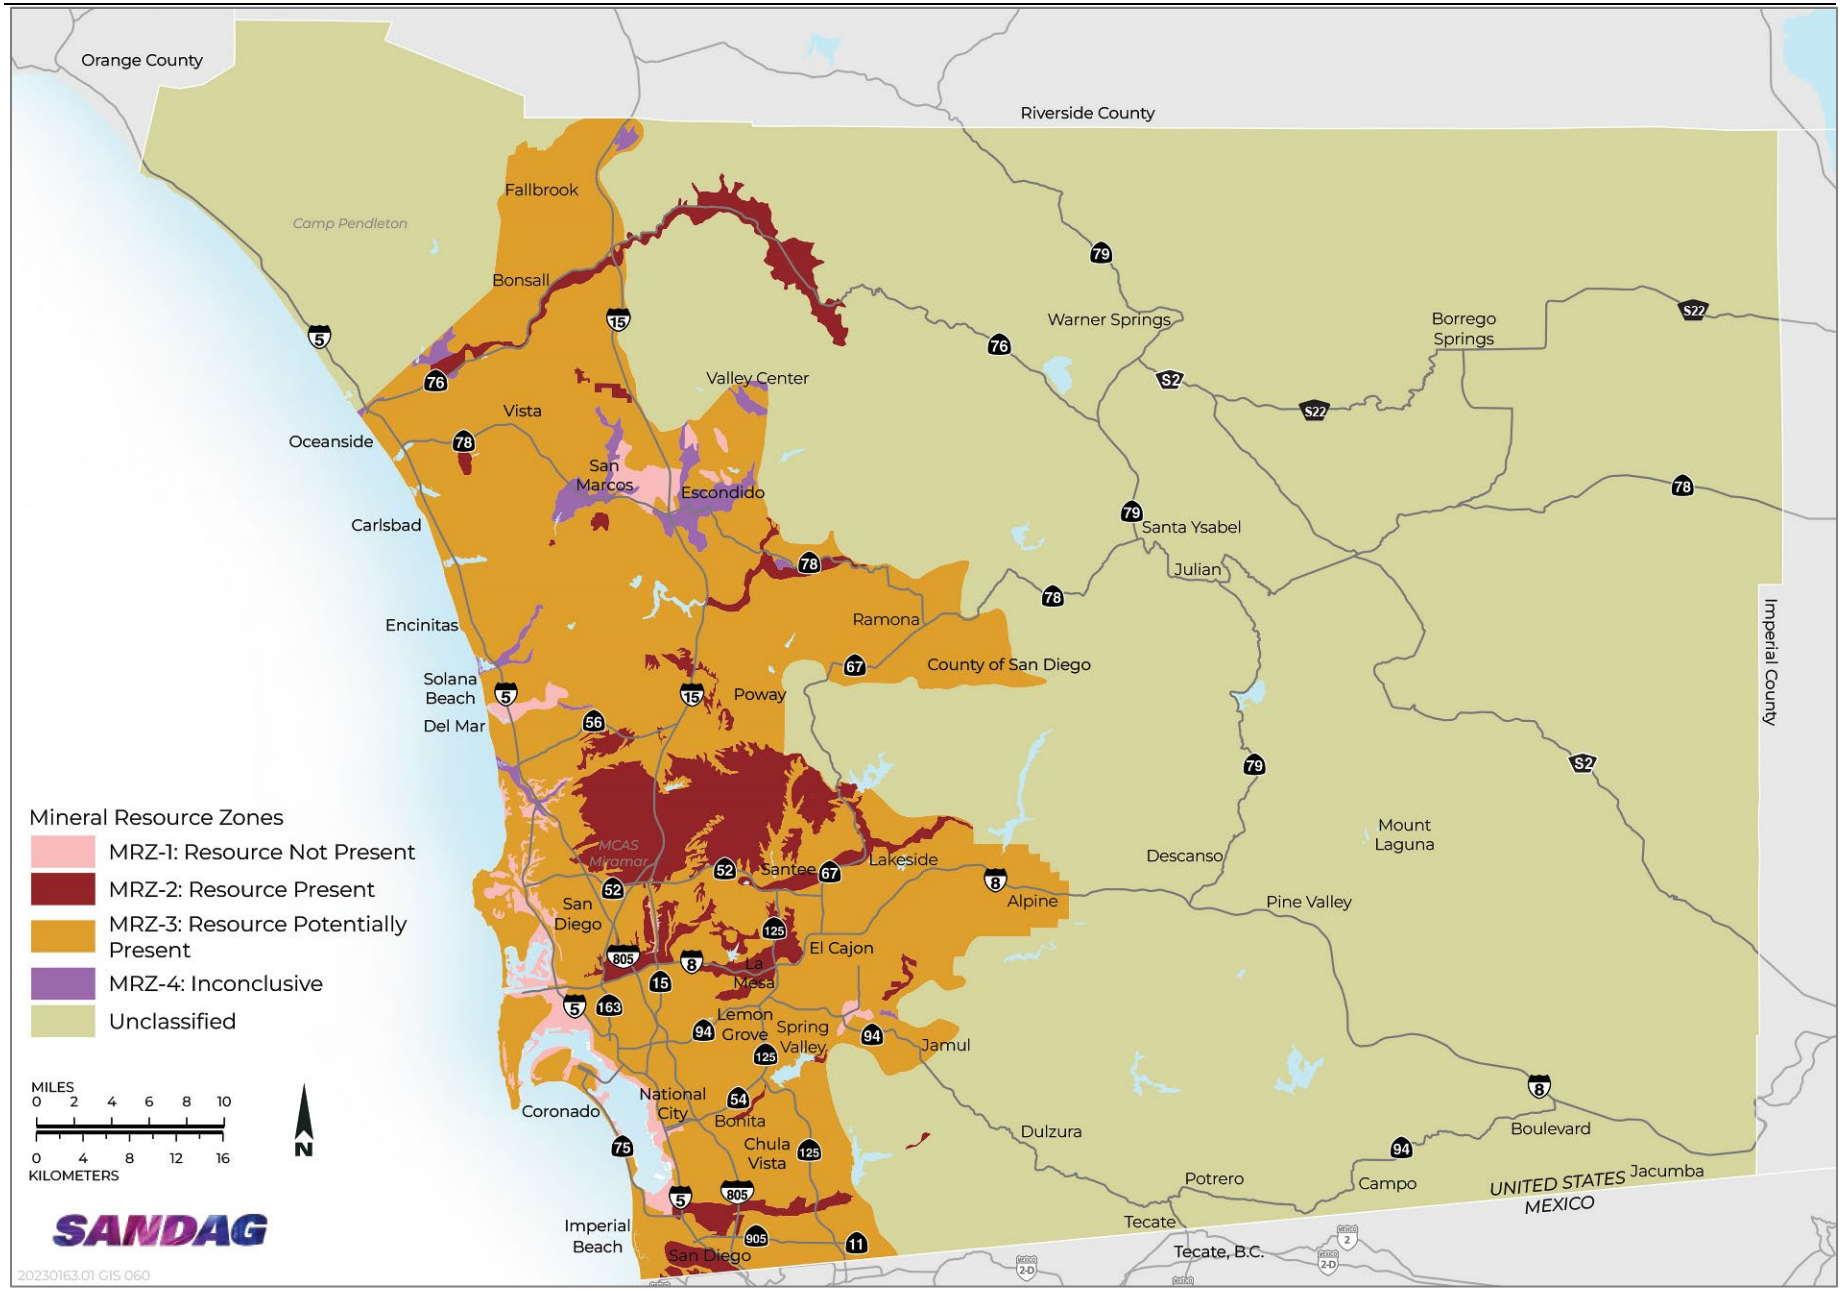
MINERAL RESOURCE ZONES

The State Surface Mining and Reclamation Act of 1975 (SMARA) (Public Resources Code Sections 2710–2796) establishes policies for the conservation, development, and reclamation of valuable mineral resources, and requires cities and counties to incorporate in their general plans the mapped locations of lands categorized by the State Mining and Geology Board (SMGB) as Mineral Resource Zones (MRZs). The primary objective of the classification and designation processes is to ensure, through appropriate lead agency policies and procedures, that mineral deposits of statewide or regional significance are available when needed. MRZs are described in Table 4.12-1. Resource recovery sites are areas where mineral resources could be extracted for use and may be designated in local land use plans. The MRZs depicted in Figure 4.12-1 only classifies the western portion of the County and is the most complete information currently available.

Table 4.12-1 Description of Mineral Zones

Zone	Description
MRZ-1	Areas where available geological information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence.
MRZ-2	Areas underlain by mineral deposits where geological data show that significant measured or indicated resources are present or where geological information indicates that significant inferred resources are likely to be present.
MRZ-3	Areas containing known mineral deposits that may qualify as mineral resources. These areas are considered to have a moderate potential to qualify as mineral resources or they occur in geologic settings that appear to be favorable environments for specific mineral deposits.
MRZ-4	Areas where geologic information does not rule out either the presence or absence of mineral resources.

Source: SMGB 2024.



Source: SANDAG, 2025.

Figure 4.12-1 Mineral Resource Zones

As shown in Figure 4.12-1, the majority of the western portion of the San Diego region is categorized as MRZ-3, which is a category given to areas containing known mineral deposits that have a moderate potential to qualify as mineral resources or that occur in geologic settings that appear to be favorable environments for specific mineral deposits.

The MRZ-1 and MRZ-4 areas make up a small portion of the San Diego region. It is important to note that there is a distinction between MRZ-1 and MRZ-4 categories, which is relevant for land-use considerations. The MRZ-1 category is given to areas where the available geological information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence. The MRZ-4 category, however, does not imply that there is a low likelihood for the presence of mineral resources. Rather, the MRZ-4 category indicates that there is a lack of knowledge regarding the presence of mineral resources. Further exploration would be required for the reclassification of MRZ-4 lands if there is evidence that a mineral resource is present.

Areas designated as MRZ-2 are those underlain by mineral deposits where geological data show that significant measured or indicated resources are present or where geological information indicates that significant inferred resources are likely to be present. Of the four MRZ categories, MRZ-2 has the highest potential to contain known significant mineral resource deposits. The existing MRZ-2 areas in the San Diego region are concentrated along major drainages, such as the San Luis Rey River (along SR 76 between I-15 and SR 78), Otay River, the Tijuana River, the San Diego River, Carroll Canyon, Sweetwater River, and the San Dieguito River. As a result, many of the region's existing mining operations are located along rivers and water courses.

AGGREGATE SUPPLY AND DEMAND

Construction aggregate is the largest nonfuel mineral commodity produced in California (CGS 2018). Aggregate materials include sand, gravel, and crushed stone, and are key ingredients in concrete and asphalt, which are essential for constructing and maintaining the physical framework of buildings and infrastructure. Aggregate is used for the construction of roads and rails, parking lots, buildings, homes, schools, hospitals, shopping centers, and other essential facilities. California Geological Survey completed the Aggregate Sustainability in California report in 2018 to provide general information about the current availability of, and future demand for, California's permitted aggregate reserves, which includes the San Diego region. According to the report, the Western San Diego region is projected to have a high demands for aggregate with a projection to need more than 500 million tons of aggregate in the next 50 years (CGS 2018). Figures 4.12-2 and 4.12-3 shows the locations of potential aggregate supply sites in the San Diego region.

4.12.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

Indian Mineral Development Act of 1982

The Indian Mineral Development Act (25 U.S. Code Sections 2101–2108) outlines provisions for minerals agreement contracts for tribal nations. Subject to the approval of the Secretary of the Bureau of Indian Affairs (BIA) and any limitation or provision contained in its constitution or charter, tribes may enter into certain agreements providing for the exploration for, or extraction, processing, or other development of, energy and nonenergy mineral resources for which tribes own a beneficial or restricted interest, or providing for the sale or other disposition of the production or products of tribal mineral resources.

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

Surface Mining and Reclamation Act of 1975

SMARA requires cities and counties to incorporate in their general plans certain mapped designations, including lands categorized as MRZs. MRZ classifications are set forth in guidelines developed by SMGB (2024) and are used to communicate information concerning the location of mineral resources.

This page is intentionally left blank.

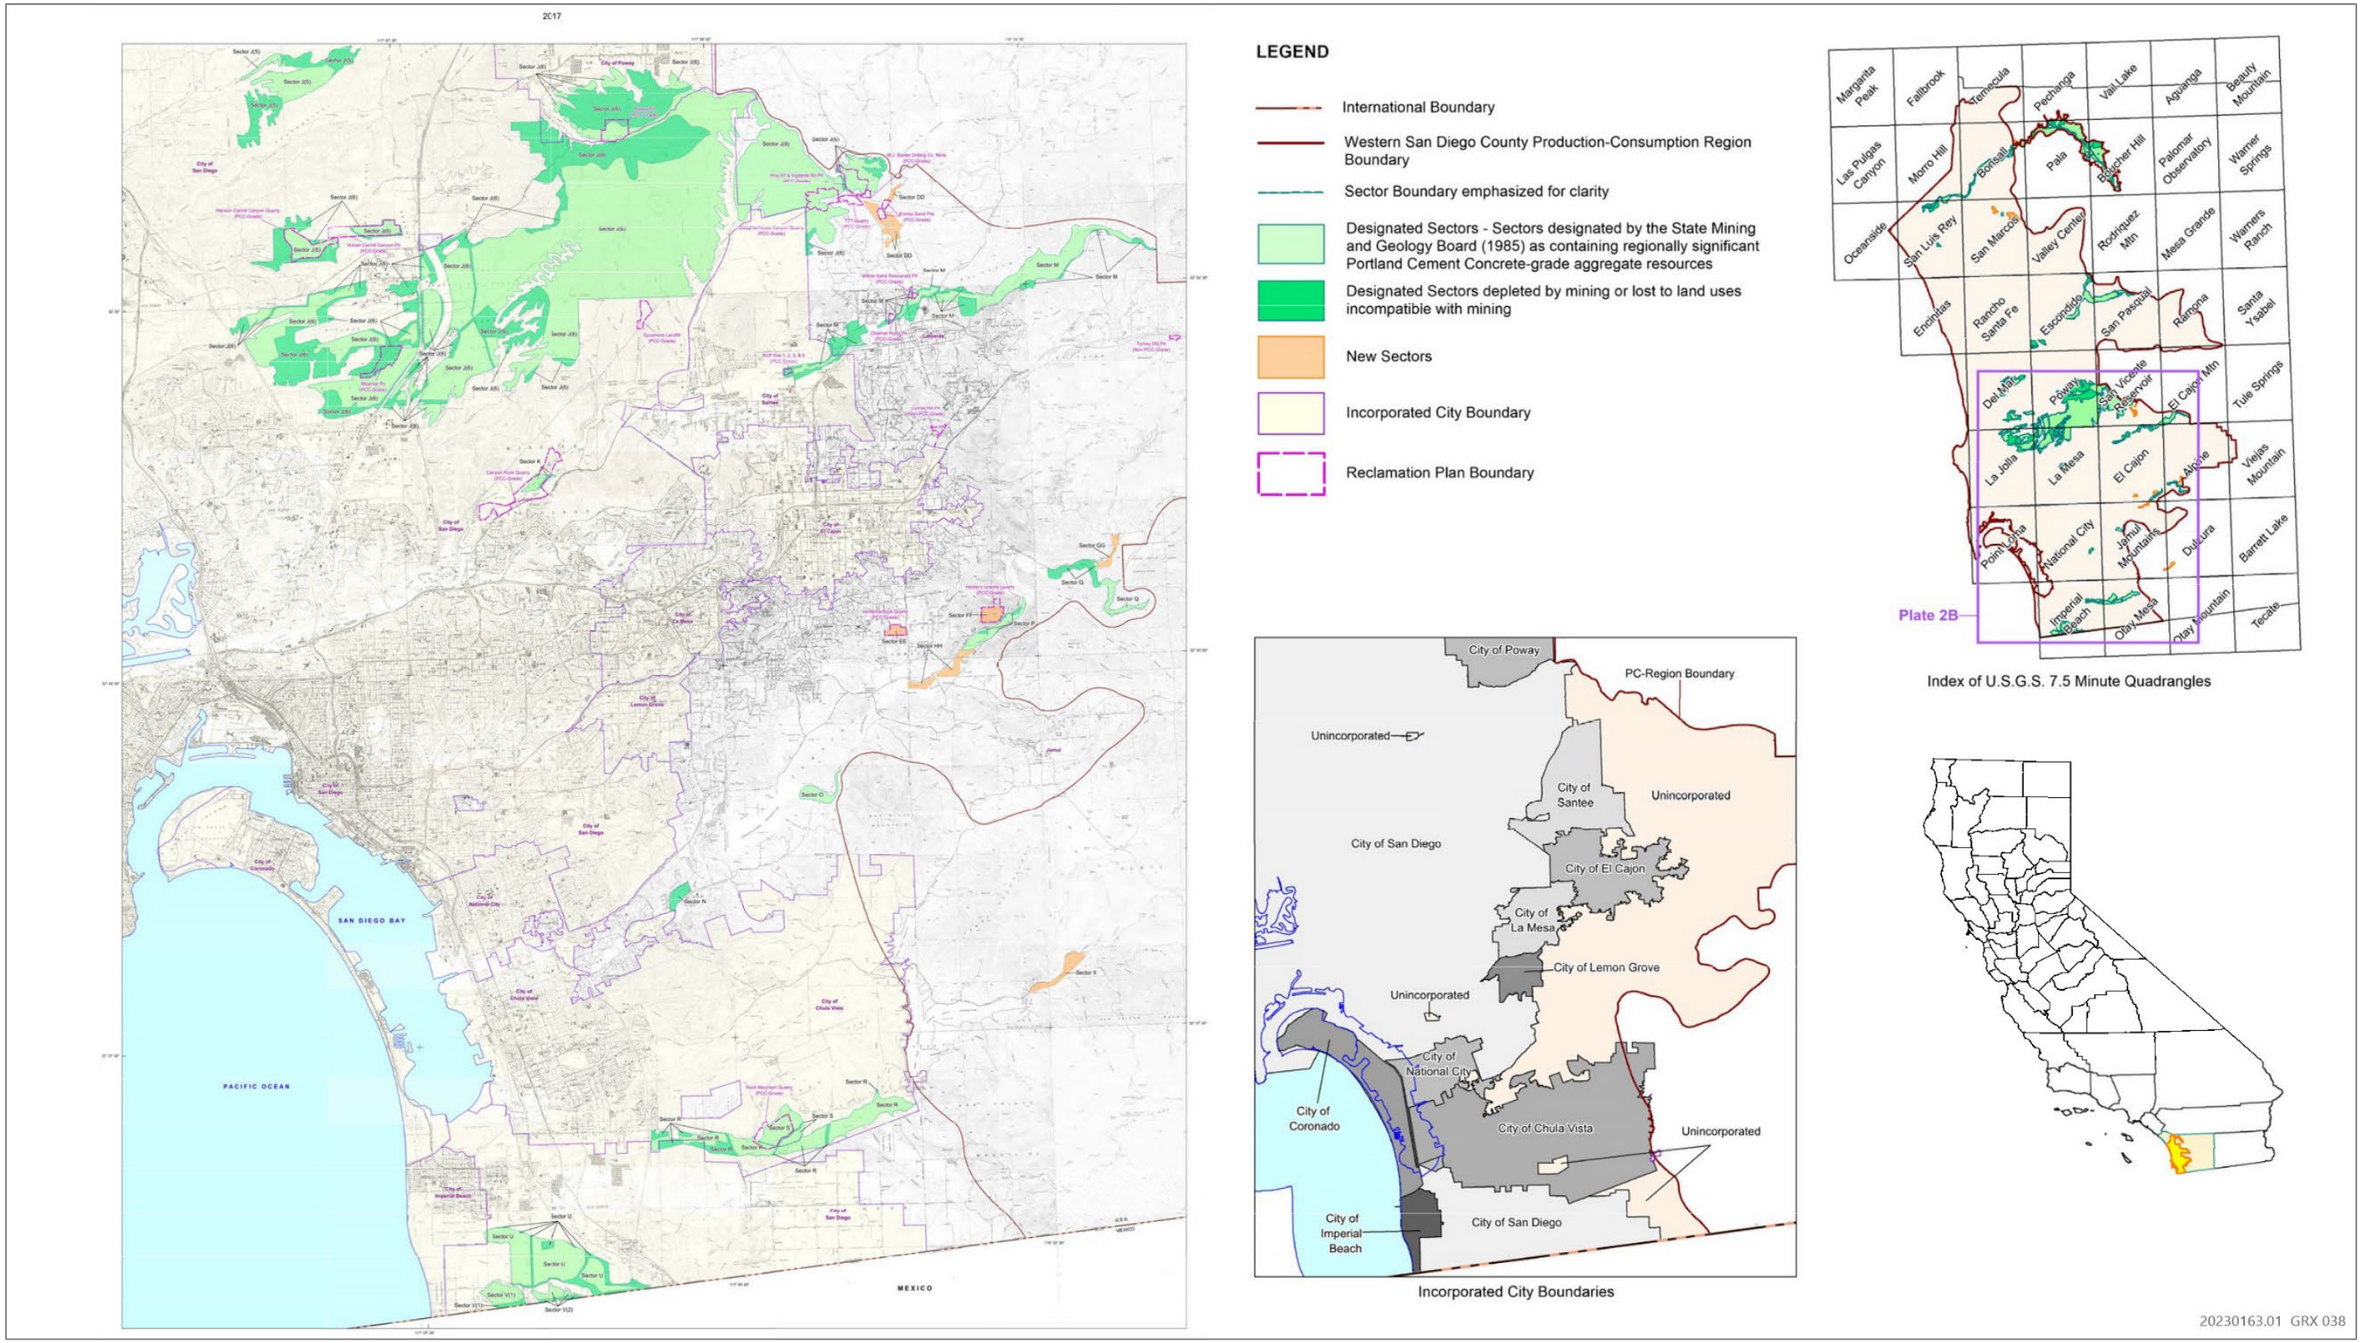
Source: Image produced and provided by California Geologic Survey in 2018; Adapted by Ascent in 2025.

Figure 4.12-2 Potential Aggregate Supply Sites – Northern



Source: Image produced and provided by California Geologic Survey in 2018; Adapted by Ascent in 2025.

Figure 4.12-3 Potential Aggregate Supply Sites – Southern

Mineral lands are mapped according to jurisdictional boundaries (e.g., counties, groups of counties, or major parts of counties), and all mineral commodities in the area are mapped, including aggregate. Priority is given to areas where future mineral resource extraction could be precluded by incompatible land use or to mineral resources likely to be mined during the 50-year period following their classification.

Section 2762(d) of SMARA establishes specific requirements for notifying the lead agency prior to permitting a use that would threaten the potential for future extraction of identified mineral resources from either (1) MRZ-2 lands or (2) land designated in a lead agency's general plan as having important minerals to be protected. Prior to permitting a use that would threaten the potential to extract minerals on lands with either of these two designations, the lead agency must prepare a statement specifying its reasons for permitting the proposed use and provide public notice of the statement. The statement must be forwarded to the state geologist and SMGB for review and is required to comply with the public review requirements of CEQA.

LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

General Plans

To comply with California Government Code Section 65302, a general plan must include "[a] conservation element for the conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources" (Section 65302[d]). Sand, gravel, and crushed rock provide construction aggregate materials and are economically the most important mineral resource in the San Diego region (County of San Diego 2011). According to the San Diego County General Plan, locally important resource recovery sites or areas where important resource recovery sites could potentially be located, are designated by the CGS as MRZ-2 or MRZ-3, or as being underlain by Quaternary alluvium. Important mineral resource recovery sites are not identified in the San Diego County General Plan Update; however, areas designated as MRZ-2 by the CGS are areas where mines currently operate and other areas where resources are known or likely to be present (County of San Diego 2011). Per the guidance in the San Diego County General Plan, the locations of mineral resources, if any, are identified in each general plan. Policies and regulations for extraction activities are addressed in general plans and local codes, as shown in Table 4.12-2.

Table 4.12-2 Policies or Regulations by Jurisdiction

Jurisdiction	Policy or Regulation on Mineral Resources
Carlsbad	The City of Carlsbad classifies Open Space for Managed Production of Resources, including major mineral resources (City of Carlsbad 2015).
Chula Vista	City of Chula Vista Municipal Code Section 19.69 covers surface mining regulations (City of Chula Vista 2024). The Chula Vista General Plan policies concerning mineral resources include: ▶ E 5.1: Ensure that permit applications for proposed mineral resource extraction are consistent with the Chula Vista MSCP Subarea Plan. ▶ E 5.2: Consider and minimize impacts from mining operations to existing and future surrounding land uses. ▶ E 5.3: Ensure that approved mining reclamation plans fully comply with requirements of the Chula Vista MSCP Subarea Plan; Chula Vista Greenbelt Master Plan; Otay Valley Regional Park Concept Plan; and all other applicable plans regarding the restoration of biological habitats and the creation of trails and parkland (City of Chula Vista 2005).
Coronado	The City of Coronado identifies open space for the managed production of resources including areas that contain mineral deposits, such as bedrock, clay sand silts, and salt. The City recognizes salt ponds as a valuable resource not only for salt evaporation purposes, but also for providing habitat for birds and marine wildlife (City of Coronado 2003).
Del Mar	The City of Del Mar Municipal Code Chapter 23.32 contains provisions on excavating and grading permits (City of Del Mar 2024).
El Cajon	The City of El Cajon General Plan states that the City of El Cajon does not have any commercial deposits of ores or minerals (City of El Cajon 2001).

Jurisdiction	Policy or Regulation on Mineral Resources
Encinitas	The City of Encinitas General Plan contains a policy allowing mineral resource extraction within the coastal zone, except in environmentally sensitive areas (City of Encinitas 2024).
Escondido	The current City of Escondido General Plan does not include any goals or policies that specifically address mineral resources or mineral extraction (City of Escondido 2012).
Imperial Beach	The City of Imperial Beach General Plan and Local Coastal Plan do not include policies regarding mineral resources (City of Imperial Beach 2024).
La Mesa	The Conservation Element of the La Mesa General Plan states that La Mesa does not have any of the resources typically discussed in a conservation element, including mineral resources. The General Plan EIR does not discuss mineral resources, and the City of La Mesa does not have policies pertaining to mineral resources (City of La Mesa 2013).
Lemon Grove	The City of Lemon Grove does not have any known mineral deposits; therefore, there are no policies pertaining to mineral resources (City of Lemon Grove 1996).
National City	The City of National City's General Plan contains language on the salt ponds of the San Diego National Wildlife Refuge. The U.S. Fish and Wildlife Service has prepared a comprehensive conservation plan that includes a holistic habitat restoration plan for the existing salt works property (City of National City 2012).
Oceanside	The City of Oceanside General Plan's long-range policies include regulating mineral extraction activities to minimize hazards and conflicts with other land uses, as well as to preserve and enhance the appearance of the area (City of Oceanside 2002).
Poway	The City of Poway's General Plan states that the City's only known valuable mineral resource is construction-quality sand and gravel that is located in the southern area of the city. Currently, one sand and gravel extraction operation is located in Beeler Canyon on the southernmost portion of this area. The City's General Plan also states that areas designated as Region-Serving Open-Space (areas that are lightly developed with activities or facilities that serve the region as unique or outstanding recreational, safety, or managed production, such as agriculture and mineral extraction) should be retained as open space and in some cases increased to serve the region's expanding needs (City of Poway 1991). Chapter 16.54 of the City of Poway's Municipal Code contains regulations on surface mining and reclamation.
City of San Diego	The City of San Diego General Plan includes policies to balance mineral extraction with habitat conservation. These policies include: ▶ CE-K.1: Promote the recycling and reclamation of construction materials to provide for the City's current and future growth and development needs ▶ CE-K.2: Permit new or expanding mining operations within the multi-habitat planning area (MHPA) in accordance with MSCP policies and guidelines. ▶ CE-K.3: Produce sand and gravel with minimal harm and disturbance to adjacent property and communities. ▶ CE-K.4: Plan rehabilitation of depleted mineral areas to facilitate reuse consistent with state requirements, the Surface Mining and Reclamation Act (SMARA), and local planning goals and policies, including the MSCP. ▶ CE-K.5: Consider local evaporative salt production for future economic value, open space use, and for important ecological habitat. (City of San Diego 2024) Section 141.1004 of the City's Municipal Code covers regulations pertaining to mining and extractive industries.
San Marcos	According to the San Marcos General Plan, the City currently does not have active mines or quarries, although two historical mining/quarry locations exist within city limits. The City will maintain awareness of and comply with state policies regarding protection and extraction of these resources (City of San Marcos 2012). City of San Marcos Zoning Ordinance Chapter 20.460 covers regulations pertaining to surface mining.
Santee	According to the City of Santee's General Plan, Santee includes a number of areas containing valuable mineral (primarily sand and gravel) resources. These include areas along the San Diego River, within hilly areas north of Carlton Hills, south of Prospect Avenue between Mesa Road and Fanita Drive, and at the north end of Magnolia Avenue. In view of the potential environmental and flooding problems associated with the mining of these resources, the City of Santee needs to carefully review and regulate all sand mining and mineral recovery proposals (City of Santee 2003). The City's General Plan contains specific policies concerning mineral resources:

Jurisdiction	Policy or Regulation on Mineral Resources
	▶ Policy 5.1: The City shall require that all proposed mining operations are adequately reviewed during the project and environmental review processes to minimize to the greatest degree possible, all identified environmental impacts, especially water quality, habitat preservation, and bridge undermining. ▶ Policy 6.1: The City shall require the planned reclamation of mined lands following extraction of mineral resources with consideration of the land's potential for recreational, wildlife habitat, and scenic uses, as well as for residential, industrial, or commercial development (City of Santee 2003). Title 15, Chapter 15.58, Article VI of the City's Municipal Code covers regulations pertaining to surface mining and reclamation.
Solana Beach	The Conservation and Open Space Element of the City of Solana Beach General Plan states that open space is used for the managed production of resource-including areas containing mineral deposits (City of Solana Beach 2014).
Vista	The City of Vista General Plan does not have policies regarding the extraction of mineral resources; however, the General Plan Update EIR states that all future development associated with the General Plan Update would undergo individual review to ensure that significant mineral resources are protected (City of Vista 2011).
County of San Diego	San Diego County Zoning Ordinance Section 2820 et seq., known as the S82 Extractive Use Regulations, is intended to identify and create areas within the county where mining, quarrying, or oil extractive uses are permitted (County of San Diego 2011). Typically, the S82 Extractive Use Regulations would be applied to areas of mineral deposits to signify the presence of such deposit and notify adjacent or affected properties of the intention to allow extraction of minerals within the zone. These regulations are used to preserve areas with valuable mineral deposits until extraction can take place. San Diego County Zoning Ordinance Section 6550 et seq. (Extractive Use Regulations) provides the means for public review and regulation of mineral extraction and associated on site processing operations. County of San Diego Code of Regulatory Ordinances Sections 87.701–87.714 regulate all surface mining operations in the unincorporated area of the County of San Diego as authorized by the San Diego County Zoning Ordinance and SMARA. The objectives of these regulations are: a. The continued mining of minerals will be permitted in a manner that will protect the public health and safety and will provide for the protection and subsequent beneficial use of mined and reclaimed land; and b. The possible adverse effects of surface mining operations on the environment, including air pollution, impedance of groundwater movement, water quality degradation, damage to aquatic or wildlife habitat, flooding, erosion, and sedimentation, will be prevented or minimized; and c. The production and conservation of minerals will be encouraged while giving consideration to values relating to recreation, watershed, wildlife, range and forage, and aesthetic enjoyment.

Note: MSCP = Multiple Species Conservation Plan; SMARA = State Surface Mining and Reclamation Act.

Source: Data compiled by Circlepoint in 2025.

4.12.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts in the form of initial study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the CEQA Guidelines Appendix G checklist questions. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR, the unique nature of the proposed Plan's mineral resources impacts, and the unique characteristics of the proposed Plan.

Checklist questions for mineral resources are provided in Section XII of CEQA Guidelines Appendix G. To streamline the analysis, the two separate mineral resources criteria (a) and (b) in CEQA Guidelines Appendix G, which are closely related, have been combined as MR-1 for the purposes of this EIR. Implementation of the proposed Plan would have a significant mineral resources impact if it would:

MR-1 Result in the loss of availability of known aggregate and mineral resources supply sites that would be of value to the region and the residents of the state or result in the loss of availability of a locally important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan.

The analysis discloses impacts on mineral resources. There is insufficient evidence to support a meaningful analysis of how the proposed Plan's mineral resources impacts would be worsened by climate change. Therefore, a climate change analysis for mineral resources impacts is not included in this section.

4.12.4 Environmental Impacts and Mitigation Measures

MR-1 RESULT IN THE LOSS OF AVAILABILITY OF KNOWN AGGREGATE AND MINERAL RESOURCES SUPPLY SITES THAT WOULD BE OF VALUE TO THE REGION AND THE RESIDENTS OF THE STATE, OR RESULT IN THE LOSS OF AVAILABILITY OF A LOCALLY-IMPORTANT MINERAL RESOURCE RECOVERY SITE DELINEATED IN A LOCAL GENERAL PLAN, SPECIFIC PLAN, OR OTHER LAND USE PLAN.

ANALYSIS METHODOLOGY

A significant impact on mineral resources would occur if implementation of regional growth and land use change or transportation network improvements and programs would result in the loss of availability of known aggregate supply sites and mineral resources that would be of value to the region and the residents of the state.

Mapped MRZ-2 lands from data provided by SANDAG are used for this analysis. The regional aggregate supply site information from California Geological Survey's Aggregate Sustainability in California report prepared in 2018 is depicted in Figures 4.12-2 and 4.12-3. The analysis quantifies direct impacts of regional growth and transportation network improvements that would occur on lands designated as MRZ-2 that would potentially be available for extraction of mineral resources.

Indirect impacts on mineral resources are analyzed qualitatively by considering the effects of forecasted changes in land use and transportation network improvements that would be incompatible with current or future mining operations in locations where mineral resources are present. Incompatible land uses would include those such as residential, institutional (e.g., schools, hospitals) or environmentally sensitive open space areas, where social or environmental factors make it unlikely that resources would be mined nearby.

IMPACT ANALYSIS

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. The cities of San Diego, Oceanside, and San Marcos both overlap areas designated as MRZ-2. The city of Chula Vista does not contain overlap areas designated as MRZ-2.

Lands designated as MRZ-2 locations are areas with known mineral resources. As shown in Figure 4.12-1, MRZ-2 locations exist along many of the major waterways in San Diego County, several of which are also the route of regional highways. In the north part of the county, these include SR 76 along the San Luis Rey River and along the San Dieguito River between I-15 and SR 78. In the central part of the county, MRZ-2 areas are found in the hills north of SR 52 and east of I-805, and along the San Diego River, including along I-8. In the south part of the county they occur along the Otay River in south Chula Vista and Otay Mesa, and from Imperial Beach south to the United States–Mexico border along the Tijuana River. Resource recovery sites are areas where mineral resources

could be extracted for use. Locally important resource recovery sites or areas where important resource recovery sites could potentially be located, or where mines are currently operating, are designated by CGS as MRZ-2 or MRZ-3, as shown on Figure 4.12-1.

Permanent loss of availability to land containing mineral resources in the region is caused by the development of incompatible uses, which directly or indirectly makes the resource inaccessible for future extraction. To accommodate regional growth and land use change by 2035, portions of vacant and undeveloped land in MRZ-2 locations would be developed for land uses considered incompatible with mining operations.

Although there are several places in the San Diego region where active mining operations have functioned in proximity to urban development, such as Mission Valley or Carroll Canyon in the City of San Diego, residential development typically restricts the availability of lands for mining operations. Noise from quarry and mining activities is typically the largest environmental impact on nearby noise-sensitive land uses (such as residential developments, industrial developments, commercial developments, and major public facilities). Residents can be concerned about potential dust, noise, blasting vibrations, truck traffic, unsightly scars on the land, and loss of habitat caused by aggregate mining. Aggregate, a regionally important mineral resource, is found in portions of MRZ-2 locations, as seen in Figures 4.12-2 and 4.12-3.

In 2035, additional vacant and undeveloped land in MRZ-2 locations would be developed for uses considered incompatible with mining operations. Development to accommodate regional growth and land use change would be constructed throughout the region. As identified in Table 4.12-3, from 2022 to 2035, regional growth and land use changes would result in the loss of approximately 644 acres of undeveloped MRZ-2 land. These impacts would result in the loss of known mineral resources.

Table 4.12-3 Conversion of Undeveloped MRZ-2 Lands under the Proposed Plan 2035 Regional Growth and Land Use Change

2022 Existing Undeveloped Land within MR-Z-2 Lands	Acres to be Converted 2022 - 2035
42,963	644

Source: Compiled by Ascent in 2025.

Therefore, regional growth and land use change under the proposed Plan would result in the loss of availability of known aggregate and mineral resources that would be of value to the region and the residents of the state, and result in the loss of availability of a locally important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan as identified in the San Diego County General Plan which areas designated as MRZ-2 (County of San Diego 2011). As a result, this impact would be significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

As identified in Table 4.12-4, in 2035, transportation network improvements and programs would result in the loss of approximately 260 acres of undeveloped MRZ-2 land between 2022 and 2035. New impacts between 2022 and 2035 are primarily due to the Mast Park to Lakeside baseball park section of the San Diego River Trail in the City of Santee, and SR 52 Complete Corridor Managed Lanes. MRZ-2 overlap would not be encountered within the City of Chula Vista; however, in the cities San Marcos, Oceanside, and San Diego have areas where MRZ-2 overlap

would occur due to the Next Gen Rapid, Active Transportation, Flexible Fleet, Managed Lanes and Next Gen Rapid projects. These projects would result in the loss of known mineral resources and mineral resource recovery sites.

Table 4.12-4 Conversion of Undeveloped MRZ-2 Lands under the Proposed Plan 2035 Transportation Network Improvements and Programs

2022 Existing Undeveloped Land within MR-Z-2 Lands	Acres to be Converted 2022 - 2035
42,963	260

Source: Compiled by Ascent in 2025.

Therefore, regional growth and land use change under the proposed Plan would result in the loss of availability of known aggregate and mineral resources that would be of value to the region and the residents of the state, and result in the loss of availability of a locally important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan. The San Diego County General Plan defines locally important mineral resource recovery sites as MRZ-2 designated areas (County of San Diego 2011). As a result, this impact would be significant.

2035 Conclusion

Implementation of regional growth and land use change, as well as transportation network improvements and programs, would result in the loss of availability of known aggregate or other mineral resources, as well as the loss of availability of locally important mineral resource recovery sites, including the loss of loss of 904 acres of MRZ-2 lands as a result of transportation network improvements. Therefore, this impact (MR-1) is significant in the year 2035.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. The cities of Carlsbad, El Cajon, San Diego, and unincorporated jurisdictions overlap with areas designated as MRZ-2. The City of Chula Vista does not overlap with areas designated as MRZ-2.

In 2050, additional vacant and undeveloped land in MRZ-2 locations would be developed for uses considered incompatible with mining operations. Development to accommodate regional growth and land use change would be constructed throughout the region. As identified in Table 4.12-5, from 2036 to 2050, regional growth and land use change would result in the loss of approximately 356 acres of undeveloped MRZ-2 land. Nevertheless, these impacts would result in the loss of known mineral resources and mineral resource recovery sites. Therefore, regional growth and land use change under the proposed Plan would result in the loss of availability of known aggregate and mineral resources that would be of value to the region and the residents of the state. Additionally, the development would result in the loss of availability of a locally important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan as identified in the San Diego County General Plan which designates these areas as MRZ-2 (County of San Diego 2011). As a result, this impact would be significant.

Table 4.12-5 Conversion of Undeveloped MRZ-2 Lands under the Proposed Plan 2050 Regional Growth and Land Use Change

2035 Undeveloped Land within MR-Z-2 Lands	Acres to be Converted 2036 - 2050
42,319	356

Source: Compiled by Ascent in 2025.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

As identified in Table 4.12-6, in 2050, transportation network improvements and programs would result in the loss of 317 acres of MRZ-2 land. New impacts to mineral resources between 2035 and 2050 are primarily due to the I-5 to Santo Road segment of the SR 52 Bikeway, and the San Luis Rey River Trail. MRZ-2 overlap would not be encountered within the City of Chula Vista; however, in the cities of Carlsbad, El Cajon, San Diego, and unincorporates areas, MRZ-2 overlap would occur due to implementation projects such as Active Transportation, Managed Lanes, and Operational Improvements. These projects would result in the loss of known mineral resources and mineral resource recovery sites. This impact would be significant.

Table 4.12-6 Conversion of Undeveloped MRZ-2 Lands under the Proposed Plan 2050 Transportation Network Improvements and Programs

2036 Undeveloped Land within MR-Z-2 Lands	Acres to be Converted 2036 - 2050
42,963	317

Source: Compiled by Ascent in 2025.

2050 Conclusion

Implementation of regional growth and land use change, as well as transportation network improvements and programs, would result in the loss of availability of known aggregate or other mineral resources, as well as the loss of availability of locally important mineral resource recovery sites, including the loss of 673 acres of MRZ-2 lands. Therefore, this impact (MR-1) is significant in the year 2050.

MITIGATION MEASURES

MR-1 RESULT IN THE LOSS OF AVAILABILITY OF KNOWN AGGREGATE AND MINERAL RESOURCES SUPPLY SITES THAT WOULD BE OF VALUE TO THE REGION AND THE RESIDENTS OF THE STATE, OR RESULT IN THE LOSS OF AVAILABILITY OF A LOCALLY IMPORTANT MINERAL RESOURCE RECOVERY SITE DELINEATED IN A LOCAL GENERAL PLAN, SPECIFIC PLAN, OR OTHER LAND USE PLAN.

2035, 2050

MR-1a Conserve Aggregate and Mineral Resources During Planning and Design of Development Projects. During planning, design, and project-level CEQA review of development projects, the County of San Diego, cities, and other local jurisdictions can and should avoid or reduce impacts on known aggregate and mineral resources and locally important mineral resource recovery sites through the evaluation and selection of project sites and design features (e.g., buffers) that minimize direct and indirect impacts on these lands. Aggregate and mineral resource areas, especially MRZ-2 areas, should be maintained in open space or other general plan land use designations and zoning that allow for extraction of mineral resources.

MR-1b Conserve Aggregate and Mineral Resources During Planning and Design of Transportation Network Improvements.

During planning, design, and project-level CEQA review of transportation network improvements, SANDAG shall, and other transportation project sponsors can and should, avoid loss of known aggregate and mineral resources and locally important mineral resource recovery sites, where feasible. Where avoidance is infeasible, SANDAG

shall, and other transportation project sponsors can and should, minimize direct and indirect impacts on the availability of known resources and recovery sites through measures that include, but are not limited to, the following:

- Designing transportation network improvements in a manner (such as buffer zones or the use of screening) that do not preclude adjacent or nearby extraction of aggregate and mineral resources following completion of the improvement and during long-term operations.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of the proposed Plan would result in the loss of availability of known aggregate or other mineral resources, as well as the loss of availability of locally important mineral resource recovery sites. Mitigation measures MR-1a and MR-1b would reduce the impact associated with the loss of availability of known mineral resources and mineral resource recovery sites, but not to less-than-significant levels because they would not prevent impacts on all MRZ-2-zoned lands. Additionally, design features that reduce the impact associated with the loss of availability of known mineral resources and mineral resource recovery sites may not reduce impacts to less than significant for all projects. Therefore, this impact (MR-1) remains significant and unavoidable.

4.12.5 Cumulative Impacts Analysis

C-MR-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO MINERAL RESOURCES

The area of geographic consideration for cumulative impacts to mineral resources is the Southern California and Northern Baja region. While some mineral resources can be distinct to certain locations, they are not confined by jurisdictional boundaries. Thus, it is necessary to consider the availability of mineral resources in Southern California and Northern Baja as a whole.

A projection approach for cumulative analysis of mineral resources allows for an overarching discussion of regional and cross-border loss of availability of mineral resources associated with general patterns of regional urbanization, growth, and land use changes. A significant cumulative impact on mineral resources would occur if the proposed Plan would result in incremental effects that are considered cumulatively significant when considered in combination with the effects on mineral resources resulting from implementation of approved regional planning documents. Significant cumulative impacts would occur if there were cumulative risks of loss of availability of valuable mineral resources or locally important recovery sites in Southern California and Northern Baja.

This cumulative impact assessment considers and relies on the impact analysis within this EIR for the proposed Plan, and SCAG 2024-2050 RTP/SCS EIR (SCAG 2024b) for the Southern California region. There are generally no regional plans pertaining to such resources for the Northern Baja California region.

Impacts of the Proposed Plan

Regional growth and land use changes and transportation network improvements associated with the proposed Plan would cause loss of availability of known mineral resources, because regional growth, land development to accommodate this growth, and transportation network improvements would encroach into MRZs and locally important resource recovery sites, resulting in the total loss of 458 acres of MRZ-2 lands by 2050. Therefore, mineral resources impacts would be significant for 2035 and 2050 (Impact MR-1).

Impacts of Projections in Adopted Plans

The EIR prepared for the SCAG 2024-2050 RTP/SCS analyzed impacts on the SCAG region up to 2050 and identified significant and unavoidable impacts related to the loss of availability of known mineral resources. The EIR also found that the updated 2024-2050 RTP/SCS would contribute to cumulatively considerable impacts on mineral resources (SCAG 2024a). Adopted land use plans for local jurisdictions in Southern California and

Northern Baja would support the construction of new development and redevelopment through policy changes, general plan updates, and zoning amendments that encourage and facilitate population growth and land use changes. Development associated with the implementation of regional planning documents would in some cases also impact availability of known mineral resources, because development would likely occur in some locations within MRZs or resource recovery sites.

Cumulative Impacts and Impact Conclusions

2035

A significant cumulative impact in the year 2035 would result if the proposed Plan's incremental effect would be cumulatively considered when considered along with the effects from adopted plans within the Southern California and Northern Baja region.

The proposed Plan would significantly impact the availability of known mineral resources due to development in locations within MRZs or resource recovery sites. Combined with the loss of the availability of mineral resources from implementation of adopted regional planning documents, such as the San Diego County's General Plan, and City of San Diego's General Plan where development from these plans have the potential to impact the availability of mineral resources, impacts from the proposed Plan would also result in significant cumulative impacts on the availability of known mineral resources in 2035.

Because cumulative mineral resources impacts throughout the Southern California and Northern Baja region by 2035 would be significant, and because the proposed Plan's incremental impacts on these resources are significant, the proposed Plan's impacts on mineral resources are also cumulatively considerable and therefore significant (Impact C-MR-1).

2050

The proposed Plan would significantly impact the availability of known mineral resources due to development in locations within MRZs or resource recovery sites. When added to the loss of the availability of mineral resources from implementation of adopted regional planning documents, such as the San Diego County's General Plan, and City of San Diego's General Plan where development from these plans have the potential to impact the availability of mineral resources, the incremental impacts from the proposed Plan would result in significant cumulative impacts on the availability of known mineral resources in 2050.

Because cumulative mineral resource impacts throughout the Southern California and Northern Baja region by 2050 would be significant, and because the proposed Plan's incremental impacts on these resources are significant, the proposed Plan's impacts on mineral resources are cumulatively considerable and therefore significant (Impact C-MR-1).

MITIGATION MEASURES

C-MR-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO MINERAL RESOURCES

2035, 2050

Mitigation measures MR-1a and MR-1b would conserve aggregate and mineral resources through avoidance of aggregate and mineral resources or through incorporation of appropriate design features to reduce impacts on resources when avoidance is not feasible. However, as outlined above, this mitigation measure would not guarantee that all proposed Plan impacts on the availability of known mineral resources would be less than significant. Therefore, the proposed Plan's incremental contributions to cumulative impacts on the availability of known mineral resources in years 2035 and 2050 would remain cumulatively considerable post mitigation.

This page is intentionally left blank.

4.13 NOISE AND VIBRATION

This section evaluates the noise and vibration impacts of the proposed Plan.

4.13.1 Existing Conditions

Prior to discussing the noise setting for the proposed Plan, background information about sound, noise, vibration, and common noise descriptors is needed to provide context and a better understanding of the technical terms referenced throughout this section.

NOISE FUNDAMENTALS

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air or water) to a hearing organ, such as the human ear (Caltrans 2020a, 2013; FTA 2018). Noise is defined as sound that is objectionable because it is unwanted, disturbing, loud, unexpected, or annoying. In the science of acoustics, the fundamental model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and the obstructions or atmospheric factors affecting the propagation path to the receiver determine the sound level and characteristics of the noise perceived by the receiver. The following sections provide an explanation of key concepts and acoustical terms used in the analysis of environmental and community noise.

Noise Descriptors

Because sound levels can vary markedly over a short period of time, various descriptors have been developed to quantify environmental and community noise. Some of the most common descriptors used to describe environmental noise, including those used in this EIR, are described below.

- **Equivalent sound level (L_{eq})** is the most common metric used to describe short-term average noise levels. The L_{eq} describes the average acoustical energy content of noise for an identified period of time, commonly 1 hour. In effect, L_{eq} is the steady-state sound level containing the same acoustical energy as the time-varying sound level that occurs during the same period (Caltrans 2013: 2-48). For instance, the 1-hour equivalent sound level, also referred to as the hourly L_{eq}, is the energy average of sound levels occurring during a 1-hour period and is the basis for noise abatement criteria used by California Department of Transportation (Caltrans) and Federal Transit Administration (FTA) (Caltrans 2013: 2-47; FTA 2018).
- **Maximum sound level (L_{max})** and **minimum sound level (L_{min})** refer to the maximum and minimum sound levels, respectively, that occur during the noise measurement period. More specifically, they describe the root-mean-square sound levels that correspond to the loudest and quietest 1-second intervals that occur during the measurement.
- **Percentile-exceeded sound level (L_x)** describes the sound level exceeded for a given percentage of a specified period. For example, L_{50} is the sound level exceeded for 50% of the time (such as 30 minutes per hour), and L_{25} is the sound level exceeded 25% of the time (such as 15 minutes per hour).
- **Community noise equivalent level (CNEL)** is a measure of the 24-hour average A-weighted sound level that is also time-weighted to "penalize" noise that occurs during the evening and nighttime hours when noise is generally recognized to be more disturbing (because people are trying to rest, relax, and sleep during these times). A 5 dBA penalty is added to the L_{eq} during the evening hours of 7:00 p.m. and 10:00 p.m., and a 10 dBA penalty is applied to the L_{eq} during the nighttime hours of 10:00 p.m. to 7:00 a.m. The energy average is then taken for the whole 24-hour day (Caltrans 2013: 2-48).
- **Day-night sound level (L_{dn} or DNL)** is also a time-weighted average of the 24-hour A-weighted noise level. The only difference is that no "penalty" is applied to the evening hours of 7:00 p.m. to 10:00 p.m. while 10 dBA

is added to the L_{eq} during the nighttime hours of 10:00 p.m. to 7:00 a.m., and the energy average is then taken for the whole 24-hour day.

Various federal, state, and local agencies have adopted CNEL or L_{dn} as the measure of community noise. Although not identical, CNEL and L_{dn} are normally within 1 dBA of each other when measured in typical community environments, and many noise standards/regulations use the two interchangeably.

Frequency, Amplitude, and Decibels

Continuous sound can be described by *frequency* (pitch) and *amplitude* (loudness). A low-frequency sound is perceived as low in pitch; a high-frequency sound is perceived as high-pitched. Frequency is expressed in terms of cycles per second, or hertz (Hz) (e.g., a frequency of 250 cycles per second is referred to as 250 Hz). High frequencies are sometimes more conveniently expressed in kilohertz, or thousands of Hz. The audible frequency range for humans is generally between 20 Hz and 20,000 Hz.

The amplitude of pressure waves generated by a sound source correlates with the loudness of that source. The amplitude of a sound is described in terms of *sound pressure level* (SPL), also referred to simply as the sound level. The SPL is typically described using a logarithmic scale in terms of decibels (dB).

Because decibels represent SPL using a logarithmic scale, SPLs cannot be added, subtracted, or averaged through ordinary arithmetic. Under the dB scale, a doubling of sound energy corresponds to a 3 dB increase. In other words, when two identical sources are each producing the same SPL at a given receiver location, the resulting sound level would be 3 dB higher than if only one of the sound sources was producing sound under the same conditions. For example, if one idling truck generates an SPL of 70 dB, two trucks idling simultaneously would not produce 140 dB; rather, they would combine to produce 73 dB. Under the dB scale, three sources of equal loudness together produce a sound level approximately 5 dB louder than one source. However, where ambient noise levels are high in comparison to a new noise source, there will be only a small change in overall noise levels when the new source is added. For example, when an ambient noise level of 70 dB is combined with a new source of 60 dB, the resulting total noise level equals 70.4 dB.

Similarly, the arithmetic mean (average) of a series of noise levels does not accurately represent the overall average noise level. Instead, the values must be averaged using a linear scale before converting the result back into a logarithmic (dB) noise level. This method is typically referred to as calculating the "energy average" of the noise levels. The same decibel calculations are used for A-weighted decibels (dBA).

A-Weighting

The dB scale alone does not adequately characterize how humans perceive noise. Human hearing is limited in the range of audible frequencies, as well as in the way it perceives the SPL in that range. In general, people are most sensitive to the frequency range of 1,000–8,000 Hz and perceive sounds within this range better than sounds of the same amplitude with frequencies outside of this range. To approximate the response of the human ear, sound levels of individual frequency bands are adjusted (or "weighted"), depending on the human sensitivity to those frequencies. Then, an "A-weighted" sound level (expressed in units of dBA) can be computed based on this information.

The resulting SPL is expressed in dBA. When people make judgments of the relative loudness or annoyance of a sound, their judgment correlates well with the A-weighted sound levels of those sounds. Table 4.13-1 describes typical A-weighted sound levels for various noise sources.

Table 4.13-1 Typical Noise Levels in the Environment

Common Outdoor Noise Source	Sound Level (dBA)	Common Indoor Noise Source
—	110	Rock band
Jet flyover at 1,000 feet	100	—
Gas lawn mower at 3 feet	90	—
Diesel truck at 50 feet at 50 miles per hour	80	Food blender at 3 feet, garbage disposal at 3 feet

Common Outdoor Noise Source	Sound Level (dBA)	Common Indoor Noise Source
Noisy urban area during daytime, gas lawn mower at 100 feet	70	Vacuum cleaner at 10 feet, normal speech at 3 feet
Commercial area, heavy traffic at 300 feet	60	—
Quiet urban daytime	50	Large business office, dishwasher next room
Quiet urban nighttime	40	Theater, large conference room (background)
Quiet suburban nighttime	30	Library, bedroom at night
Quiet rural nighttime	20	—
—	10	Broadcast/recording studio
Lowest threshold of human hearing	0	Lowest threshold of human hearing

Note: dBA = A-weighted decibels.
Source: Caltrans 2013.

Sound Propagation

When sound propagates over a distance, it changes in level and frequency content. The way noise is reduced with distance depends on the following factors.

Geometric spreading. Sound from a localized source (i.e., a "point" source) radiates uniformly outward away from the source in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dBA for each doubling of distance from a point source. Road and highway noise is not a single stationary source of sound. The movement of vehicles on a road or highway makes the source of sound appear to emanate from a line (i.e., a "line" source) rather than a point. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dBA per doubling of distance from a line source.

Ground absorption. The noise path from a source to a receiver is usually very close to the ground. The excess noise attenuation from ground absorption occurs due to acoustic energy losses on sound wave reflection. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., sites with an absorptive ground surface between the source and the receiver, such as soft dirt, grass, or scattered bushes and trees), an additional ground-attenuation value of 1.5 dBA per doubling of distance is normally assumed. When added to the geometric spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dBA per doubling of distance for a line source and 7.5 dBA per doubling of distance for a point source for propagation over soft sites.

Atmospheric effects. Receivers located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels, because wind can carry sound. Sound levels can be increased over large distances (e.g., more than 500 feet) from the source because of atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors, such as air temperature, humidity, and turbulence, can also affect sound attenuation.

Shielding by natural or human-made features. A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object, proximity to the noise source and the receiver, surface weight, solidity, and the frequency content of the noise source. Natural terrain features (such as hills and dense woods) and human-made features (such as buildings and walls) can substantially reduce noise levels. Walls are often constructed between a source and a receiver for the specific purpose of reducing noise. In addition to the noise that diffracts over the top of a barrier, noise will also diffract around the ends of a barrier, leading to "flanking" noise that can reduce the overall efficacy of the barrier. Assuming it is long enough to minimize the effects of flanking noise, a barrier that breaks the line of sight between a source and a receiver will typically result in at least 5 dBA of noise reduction (Caltrans 2013: 2-41; FTA 2018: 15, 16). Barriers higher than the line of sight provide increased noise reduction

(FTA 2018: 16). Vegetation between the source and receiver is rarely effective in reducing noise because it does not create a solid barrier unless there are multiple rows of vegetation (FTA 2018: 15, 104, 106).

Human Response to Noise

Noise-sensitive receptors (also called "receivers") are locations where people reside or where the presence of unwanted sound may adversely affect the use of the land (see "Noise-Sensitive Land Uses" below). Noise can have a range of effects on people, including hearing damage, sleep interference, speech interference, performance interference, physiological responses, and annoyance (Caltrans 2013; WHO 1999). Each of these effects is briefly described below.

Hearing damage. A person exposed to high noise levels can suffer either gradual or traumatic hearing damage. Gradual hearing loss occurs with repeated exposure to excessive noise levels and is most commonly associated with occupational noise exposures in heavy industry or other very noisy work environments. Traumatic hearing loss is caused by sudden exposure to an extremely high noise level, such as a gunshot or explosion at a very close range. The potential for noise-induced hearing loss is not generally a concern in typical community noise environments. Noise levels in neighborhoods, even in very noisy airport environments, are not sufficiently loud as to cause hearing loss.

Sleep interference. Exposure to excessive noise levels at night has been shown to cause sleep disturbance. Sleep disturbance refers not only to awakening from sleep, but also to effects on the quality of sleep, such as altering the pattern and stages of sleep. World Health Organization guidelines recommend noise limits of 30 dBA L_{eq} (8-hour average) for continuous noise and 45 dBA L_{max} for single sound events inside bedrooms at night to minimize sleep disturbance (WHO 1999).

Speech interference. Speech Interference can be a problem in any situation where clear communication is desired but is often of particular concern in learning environments (such as schools) or situations where poor communication could jeopardize safety. Normal conversational speech inside homes is typically in the range of 50–65 dBA (EPA 1977), and any noise in this range or louder may interfere with speech. As background noise levels rise, the intelligibility of speech decreases, and the listener will fail to recognize an increasing percentage of the words spoken. A speaker may raise his or her voice to compensate for higher background noise levels, but this in turn can lead to vocal fatigue for the speaker.

Physiological responses. Acute noise has been shown to cause measurable physiological responses in humans, including changes in stress hormone levels, pulse rate, and blood pressure. The extent to which these responses cause harm or are signs of harm is not clearly defined, but it has been postulated that they could contribute to stress-related diseases, such as hypertension, anxiety, and heart disease. In addition, statistically significant health risks have been found for extended exposure to very high noise levels, such as for workers exposed to high levels of industrial noise for 5 to 30 years (WHO 1999).

Annoyance. The subjective effects of annoyance, nuisance, and dissatisfaction are possibly the most difficult to quantify, and no completely satisfactory method exists to measure these effects. The difficulty arises primarily from differences in individual sensitivity and habituation to sound, which vary widely from person to person. What one person considers tolerable can be quite unbearable to another of equal hearing acuity. An important tool in estimating the likelihood of annoyance due to a new sound is by comparing it to the existing baseline or "ambient" environment to which that person has adapted. In general, the more the level or tonal (frequency) variations of a sound exceeds the previously existing ambient sound level or tonal quality, the less acceptable the new sound will be, as judged by the exposed individual.

In most cases, effects from sounds typically found in the natural environment would be limited to annoyance or interference. Physiological effects and hearing loss would be more commonly associated with human-made noise, such as in an industrial or occupational setting. Studies have shown that under controlled conditions in an acoustics laboratory, a healthy human ear is able to discern changes in sound levels of 1 dBA. In the normal environment, the healthy human ear can detect changes of about 2 dBA; however, it is widely accepted that a doubling of sound energy, which results in a change of 3 dBA in the normal environment, is considered just

noticeable to most people. A change of 5 dBA is readily perceptible, and a change of 10 dBA is perceived as being twice as loud (Caltrans 2013).

Noise-Sensitive Land Uses

Sensitive noise receptors are generally considered people who occupy land uses where noise is an important attribute of the environment for activities that require quiet, including sleeping, convalescing, and studying. These land uses typically include residential dwellings, hotels/motels, hospitals, nursing homes, educational facilities, and libraries. Each city or county typically provides a list of noise-sensitive receptors to consider in their general plan noise element and/or noise ordinance. Protected wildlife (special-status species) and their habitat may also be considered noise-sensitive receptors, especially during the species breeding season, such as protected nesting birds.

GROUNDBORNE VIBRATION FUNDAMENTALS

Vibration is the periodic oscillation of a medium or object for a given reference point. Groundborne vibration is a small, rapidly fluctuating motion transmitted through the ground. The effects of groundborne vibrations are typically limited to causing nuisance or annoyance to people, but at extreme vibration levels, damage to buildings may also occur.

In contrast to airborne sound, groundborne vibration is not a phenomenon that most people experience every day. The ambient groundborne vibration level in residential areas is usually much lower than the threshold of human perception. Most perceptible indoor vibration is caused by sources within buildings, such as mechanical equipment while in operation, people moving, or doors slamming. Typical outdoor sources of perceptible groundborne vibration are heavy construction activity (such as blasting, pile driving, or earthmoving), steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the groundborne vibration from traffic is rarely perceptible, even in locations close to major roads. The strength of groundborne vibration from typical environmental sources diminishes (or attenuates) rapidly over distance.

For the prediction of groundborne vibration, the fundamental model consists of a vibration source, a receptor, and the propagation path between the two. The power of the vibration source and the characteristics and geology of the intervening ground, which affect the propagation path to the receptor, determine the groundborne vibration level and the characteristics of the vibration perceived by the receptor.

Groundborne noise occurs when vibration propagating through a building causes room surfaces to vibrate and radiate noise into interior spaces. Many vibration sources, such as heavy construction and steel-wheeled trains, also generate substantial levels of airborne noise. This airborne noise typically dominates the overall noise level such that any groundborne noise contribution is negligible to a person inside the building. Groundborne noise is typically only an issue for scenarios that do not generate high levels of airborne noise at the receiver location. Examples include subway or tunnel operations where there is no airborne noise path or situations where people are in buildings with substantial sound insulation, such as recording studios. Groundborne noise is typically quantified using the A-weighted sound level.

Frequency and Amplitude

The frequency of a vibrating object describes how rapidly it is oscillating. The unit of measurement for the frequency of vibration is Hz (the same as used in the measurement of noise), which describes the number of cycles per second. The amplitude of vibration can be measured in terms of displacement, velocity, or acceleration. Displacement describes the distance that a particle moves from its resting (or equilibrium) position as it oscillates and can be measured in inches. The amplitude of vibration velocity (the speed of the movement) can be measured in inches per second (in/sec).

Vibration Descriptors

As noted above, there are various ways to quantify groundborne vibration based on its fundamental characteristics. Because vibration can vary markedly over a short period of time, various descriptors have been

developed to quantify vibration. The two most common descriptors used in the analysis of groundborne vibration are peak particle velocity and vibration velocity level, each of which are described below.

Peak particle velocity (PPV) is defined as the maximum instantaneous positive or negative peak amplitude of the vibration velocity. The unit of measurement for PPV is in/sec. Unlike many quantities used in the study of environmental acoustics, PPV is typically presented using linear values and does not employ a dB scale.

Vibration velocity level (L_v) describes the root-mean-square (RMS) vibration velocity. L_v is essentially a "smoothed" value that quantifies the average vibration amplitude over a 1-second period. L_v is reported on a logarithmic decibel scale with the abbreviation vibration decibels (VdB) commonly used to distinguish vibration decibels from noise level decibels.

Vibration Propagation

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish (attenuate) with distance away from the source. High-frequency vibrations reduce much more rapidly than low frequencies so that low frequencies tend to dominate the spectrum at large distances from the source. The propagation of groundborne vibration is also influenced by geological factors, such as soil conditions, depth to bedrock, soil strata, frost conditions, and water conditions.

Effects of Groundborne Vibration

Vibration can result in effects that range from annoyance to structural damage. Annoyance or disturbance of people may occur at vibration levels substantially below those that would pose a risk of damage to buildings. Each of these effects is discussed below.

Potential Building Damage

When groundborne vibration encounters a building, vibrational energy is transmitted to the structure, causing it to vibrate, and if the vibration levels are high enough, damage to the building may occur. Depending on the type of building and the vibration levels, this damage could range from cosmetic architectural damage (e.g., cracked plaster, stucco, or tile) to more severe structural damage (e.g., cracking of floor slabs, foundations, columns, beams, or wells). (See Table 4.13-9 for vibration damage thresholds.) Buildings can typically withstand higher levels of vibration from transient sources than from continuous or frequent intermittent sources. Transient sources are those that create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment. Older, fragile buildings (which may include important historical buildings) are of particular concern. Modern commercial and industrial buildings can generally withstand much higher vibration levels before potential damage would occur.

Human Disturbance/Annoyance

Groundborne vibration can be annoying to people and can cause serious concern for nearby neighbors of vibration sources, even when vibration is well below levels that could cause physical damage to structures. Groundborne vibration is almost exclusively a concern inside buildings and is rarely perceived as a problem outdoors, where the motion may be discernible, but there is less adverse reaction without the effects associated with the shaking of a building. When groundborne vibration waves encounter a building, vibrational energy is transmitted to the structure causing building surfaces (walls, floors, and ceilings) to vibrate. This movement may be felt directly by building occupants and may also generate a low-frequency rumbling noise as sound waves are radiated by the vibrating surfaces. At higher frequencies, building vibration can cause other audible effects, such as rattling of windows, building fixtures, or items on shelves or hanging on walls. These audible effects due to groundborne vibration are referred to as groundborne noise. Any perceptible effect (vibration or groundborne noise) can lead to annoyance. The degree to which a person is annoyed depends on the activity in which they are participating at the time of disturbance. For example, someone sleeping or reading may be more sensitive than someone who is engaged in any type of physical activity.

Vibration-Sensitive Land Uses

Because building damage would be considered a permanent negative effect at any building, regardless of land use, any type of building would typically be considered sensitive to vibration damage impacts. Fragile structures, which often include historical buildings, are most susceptible to damage and are of particular concern.

Land uses that would be considered sensitive to human annoyance caused by vibration are generally the same as those that would be sensitive to noise and would typically include residential dwellings, hotels/motels, hospitals, nursing homes, educational facilities, and libraries. It is noted, however, that vibration effects are typically only considered inside occupied buildings and not at outside areas, such as residential yards, parks, or open spaces.

AMBIENT NOISE LEVELS AND EXISTING NOISE SOURCES

Ambient noise is the background noise level of any location or environment, normally specified to compare it to a new intrusive noise source. Ambient noise includes all sounds present in an environment and can be measured at any moment in time, but it typically varies in time. Ambient noise levels are generally considered low when ambient levels are below 45 dBA CNEL, moderate in the 45–65 dBA CNEL range, and high above 65 dBA CNEL.

The existing noise environment in the Plan area is composed of transportation and nontransportation sources. Transportation sources include roadway vehicle traffic; railroad train operations, including light rail, commuter, and freight trains; and aircraft operations. Generally, transportation-related noise sources (e.g., vehicle traffic noise) characterize the ambient noise environment of an area. Nontransportation, or localized stationary/fixed sources, include mechanical equipment, commercial/industrial equipment and operations, construction equipment, and any other sources not associated with the transportation of people or goods. Existing noise exposure associated with these primary noise sources in the San Diego region is presented below.

Vehicle Traffic Noise

The ambient noise environment in the Plan area is primarily defined by roadway vehicle traffic. The traffic-noise level generated on a roadway is dependent on traffic speed, traffic volume, and the relative percentage of medium (two-axle) and heavy trucks (trucks with three or more axles). In general, the greater the traffic volume on a roadway, the higher the noise levels generated on that roadway. This holds true until the traffic volume is so great (i.e., approaching capacity) that traffic flow degrades, and traffic speeds decrease as the roadway becomes congested, which lowers traffic noise levels. All else being equal, roadways with larger percentages of trucks (particularly heavy trucks) will generate higher noise levels. A heavy truck traveling 50 miles per hour (mph) generates approximately 85 dBA at 50 feet (Caltrans 2013), whereas an automobile traveling at the same speed generates only 74 dBA (FTA 2018). As a result, the heavy truck sounds more than twice as loud as the automobile (an increase of 10 dBA is usually perceived as a "doubling" of sound).

Roadways that generate the highest noise levels in the Plan area are the interstate and state highways because they have the highest speed limits, the largest traffic volumes, and the highest percentage of trucks. Figure 2-1 in Chapter 2, "Project Description," shows the interstate and state highway network and significant arterials in the Plan area. Traffic typically generates 70–75 dBA L_{dn} at 50–100 feet from major highways. Heavily used roadways, such as arterials and major streets, also generate significant levels of noise, typically 65–70 dBA L_{dn} at similar distances (FTA 2018).

Noise from line sources, such as roadways, typically attenuate at a rate of 3–4.5 dBA per doubling of distance, depending on the ground conditions (FHWA 2011). Additional attenuation is provided by the presence of natural or human-made barriers or structures. In populated areas, a general rule for estimating noise reductions due to intervening structures is to assume one row of buildings every 100 feet from the roadway and apply a 4.5 dBA reduction in traffic noise levels for the first row and a 1.5 dBA reduction for every subsequent row, up to a maximum of -10 dBA attenuation (FTA 2018). Highway traffic noise is not usually a serious problem for people who live more than 500 feet from heavily traveled freeways or more than 100–200 feet from lightly traveled roads (FHWA 2011).

In the San Diego region, there is a wide range of land uses located adjacent to highways and major streets, including residences, schools, churches, hospitals, shopping centers, industrial parks, agriculture, parks, and open space. Of these, residences, schools, churches, and hospitals are typically considered noise sensitive by cities and the County, as defined in the noise elements of their respective general plans. Noise elements are discussed in Section 4.13.2, below.

Rail Noise

Ambient noise levels in the Plan area are also characterized by noise from rail operations. The two basic types of railroad operations are freight and passenger train operations, the latter consisting of commuter and intercity passenger trains and steel-wheel urban railway transit (i.e., trolley). Generally, freight train operations can occur at all hours of the day and night, whereas passenger train operations are concentrated within the daytime and evening periods. Train operations are intermittent, and rail lines are widely dispersed except for limited locations with a higher concentration of activity, such as freight rail/switching yards or transit centers where various railways converge (e.g., at the Santa Fe Depot in downtown San Diego). As a result, large parts of the Plan area experience little to no rail noise, and it does not contribute substantially to the ambient noise levels in these areas. Nonetheless, train operations generate substantial noise levels in the immediate vicinity of the railways.

The overall noise level from rail lines is the combination of multiple subsources. These include the propulsion systems (typically electric control systems and motors for light rail and rapid transit, and diesel engines for larger locomotives) and their ancillary devices (e.g., cooling fans and gears), and noise generated by the interaction of the wheels and tracks (rolling noise due to continuous rolling contact; impact noise when a wheel encounters a rail joint, turnout, or crossover; and squeal generated by friction on tight curves) (FTA 2018). In addition, the sounding of train air horns and crossing gate bells also contribute to higher noise levels near railway/roadway grade crossings (FTA 2018). Other sources of noise associated with rail operations are train stations, maintenance yards and shops, power substations, and switchyards.

Similar to traffic noise, described above, mobile rail noise sources are considered line sources with typical attenuation rates of 3–4.5 dBA per doubling of distance, depending on the ground conditions (FHWA 2011) and additional attenuation provided by the presence of natural or human-made barriers or structures. Stationary sources (such as crossing bells) are considered point sources with typical attenuation rates of 6–7.5 dBA per doubling of distance, depending on the ground conditions, and additional attenuation provided by the presence of natural or human-made barriers or structures.

Average railway noise levels (L_{dn}) at distances from mainline railway corridors can be estimated based on an average train traffic volume of 5–10 trains per day at speeds of 30–40 mph from the center of the railway, as shown in Table 4.13-2 (FTA 2018).

Table 4.13-2 Estimating Railway Noise Exposure for General Assessment

Distance from Railway (feet)	Noise Exposure Estimates (L_{dn})
10–30	75
30–60	70
60–120	65
120–240	60
240–500	55
500–800	50
800 and up	45

Notes: L_{dn} = day-night sound level.

Source: FTA 2018.

In the Plan area, a wide range of land uses (some noise-sensitive) are located adjacent to railways, such as residences, schools, hospitals, shopping centers, industrial parks, agriculture, parks, and open space. FTA provides "screening distances" to estimate where significant noise impacts may occur relative to various rail and other transportation facilities. Some examples are provided in Table 4.13-3 (FTA 2018). The presence of sensitive receptors within these screening distances does not mean noise impacts would occur, simply that FTA procedures require additional analysis under these conditions.

Table 4.13-3 Example FTA Screening Distances for Rail and Other Transportation Facility Noise

Type of Project	Screening Distance (feet) Unobstructed	Screening Distance (feet) with Intervening Buildings
Commuter rail mainline	750	375
Commuter Rail Station		
with horn blowing	1,600	1,200
without horn blowing	250	200
Commuter rail-highway crossing with horns and bells	1,600	1,200
Rail rapid transit (RRT)	700	350
RRT station	200	100
Light rail transit (LRT)	350	175
Streetcar	200	100
Access roads to stations	100	50
Low and Intermediate Capacity Transit		
steel wheel	125	50
rubber tire	90	40
monorail	175	70
Yards and shops	1,000	650
Parking facilities	125	75
Access roads to parking	100	50
Ventilation shafts	200	100
Power substations	250	125
Bus Systems		
Busway	500	250
Bus rapid transit (BRT) on exclusive roadway	200	100
Bus Facilities		
access roads	100	50
transit mall	225	150
transit center	225	150
storage and maintenance	350	225
Park & Ride lots with buses	225	150
Ferry boat terminals	300	150

Notes: FTA = Federal Transit Administration. Although some of the project types referenced in this table are not directly related to rail projects, the screening distances reflected as part of the FTA Transit Noise and Vibration Impact Assessment Manual may be relevant to other aspects of the proposed Plan. The screening distances are based on assumptions made using the lowest noise impact threshold (i.e., 50 dBA for all residential land use and buildings where people normally sleep).

Source: FTA 2018.

Aircraft Noise

The Plan area is also affected by noise from aircraft operations, which generate substantial noise levels in the immediate vicinity of airport runways and approach and departure flight paths. The San Diego region includes the following airports, as shown in Figure 4.9-1 in Section 4.9, "Hazards and Hazardous Materials":

- **International and domestic airports:** San Diego International Airport (SDIA), Tijuana International Airport (directly across the US border with Mexico), and McClellan-Palomar (Carlsbad) Regional Airport
- **Military airfields:** Naval Air Station North Island, Marine Corps Air Station (MCAS) Miramar, MCAS Camp Pendleton, Naval Outlying Landing Field Imperial Beach, and Coast Guard Air Station San Diego
- **Towered general aviation airports:** Brown Field, Gillespie Field, Montgomery Field, and Ramona Airport
- **Non-towered general aviation airports:** Agua Caliente Airport, Borrego Valley Airport, Fallbrook Community Airpark, Jacumba Airport, Oceanside Municipal Airport, Octotillo Airport, and Pauma Valley Airport

In addition to the numerous daily aircraft operations originating and terminating at these facilities, aircraft not utilizing these airports fly over the San Diego region at various altitudes and contribute to the overall ambient noise environment. The proximity of the noise receptor to the airport and aircraft flight path(s) determine the noise exposure. Other contributing factors include the type of aircraft, type and number of aircraft operations (e.g., takeoffs, landings, flyovers), altitude of the aircraft, and atmospheric conditions, which may alter the approach and departure direction of aircraft, as well as affect aircraft noise propagation.

As discussed in further detail below, state law requires land use commissions to prepare and adopt an airport land use compatibility plan (ALUCP) for each public-use and military airport. These plans typically include airport noise contour maps illustrating the average daily noise exposure (measured in dBA CNEL) in the airport vicinity. Copies of the available existing noise contour maps for Plan area airports are provided in Appendix L, Noise Modeling Calculations and Existing Noise Contour Maps for Plan Area Airports (Appendix L). For smaller airports (e.g., Ramona Airport), noise levels range from approximately 60–70+ dBA CNEL. Lower noise levels (60–65 dBA CNEL) may extend several thousand feet from the airport boundaries along dominant flight path(s), whereas higher noise levels (70+ dBA CNEL) do not extend much (approx. 200 feet) beyond the airport boundaries (SDCRAA 2022a). For the largest airports (e.g., SDIA) reported noise levels range from approximately 60–75 dBA CNEL. The lower noise levels from major airports (60–65 dBA CNEL) may extend several miles from the airport boundaries along dominant flight path(s), whereas higher noise levels (75 dBA CNEL) may extend several thousand feet (SDCRAA 2014).

In addition to public-use and military airports, there are numerous private and special-use airstrips and helipads in the Plan area, many which are located within the eastern areas of the region or remote vacation destinations. Several private helipads are located on the roofs of hospitals and buildings owned by large corporations or used by police stations. Private airstrips/helipads located within the San Diego region are not required to prepare noise contours because their noise levels are substantially less than airports due to lower activity levels and their use restrictions are much less defined than with public-use airports (SDCRAA 2014).

Construction Noise

Construction activities generate temporary, short-term noise levels. For large transportation projects, the total period of construction can be months or even years; however, these projects often have a large linear footprint (e.g., a stretch of freeway or railroad), which means that peak construction activities only occur adjacent to any single receptor for a limited portion of the total duration. Construction noise is of more concern when it takes place near noise-sensitive land uses or occurs at night or in early morning hours. Construction noise can also affect nearby noise-sensitive special-status wildlife species and habitat by interfering with the ability to establish territory, vocalize, or successfully reproduce. Additional discussion of noise-sensitive special-status wildlife is provided in Section 4.4, "Biological Resources." Local governments typically regulate noise associated with construction equipment and activities through enforcement of noise ordinance standards, implementation of general plan policies, and imposition of conditions of approval for building or grading permits.

Noise generated from construction equipment varies greatly depending on the construction activity being performed, equipment type, model, age, condition, and usage. High-impact construction techniques, such as pile driving, blasting, and crack-and-seat pavement breaking, produce the highest noise levels and typically dominate the local noise environment when they occur; however, these techniques are not required for all construction projects. Outside of high-impact techniques, heavy equipment operation (e.g., earthmoving) typically dominates the noise generated at construction sites. Stationary sources, such as generators, pumps, and compressors, may also produce substantial continuous noise.

The magnitude of overall construction noise levels depends on the type of construction activity, the schedule of multiple pieces of construction equipment operating simultaneously, the duration of the activity, the distance between the activity and noise-sensitive receptors, and the presence or absence of any noise attenuating features. Table 4.13-4 provides a list of typical construction equipment, their maximum operational noise level (L_{max}) at 50 feet, their typical duty cycles (i.e., percentage operated within a period of time), and the resulting average noise level (L_{eq}) at 50 feet.

Table 4.13-4 Construction Equipment Noise Levels

Equipment	L_{max} at 50 Feet, dBA	Typical Duty Cycle (Percent)	L_{eq} at 50 Feet, dBA
Auger drill rig	84	20	77
Backhoe	78	40	74
Blasting	94	1	74
Chain saw	84	20	77
Clam shovel	87	20	80
Compactor (ground)	83	20	76
Compressor (air)	78	40	74
Concrete mixer truck	79	40	75
Concrete pump	81	20	74
Concrete saw	90	20	83
Crane (mobile or stationary)	81	16	73

Vibratory pile driver	101	20	94

Notes: kVA = kilovolt amp; dBA= A-weighted decibels; L_{max} = maximum sound level; L_{eq} = equivalent sound level.

Source: FHWA 2006.

As shown in Table 4.13-4, maximum noise levels generated by typical construction equipment range from approximately 73–90 dBA measured at 50 feet (assuming no attenuation from intervening features, such as buildings or topography); high-impact equipment (pile driving, blasting, and impact hammers) generates 90–101 dBA at 50 feet (FHWA 2006). The noise levels vary for each type of equipment, because equipment may come in different sizes and with different engines. Construction equipment noise levels also vary as a function of the activity level or duty cycle. In a typical construction project, the loudest short-term noise levels are typically those of earthmoving equipment under full load, which typically range from 85–90 dBA at 50 feet from the source.

Noise impacts on sensitive receptors resulting from construction projects would depend on several factors, such as the type of project, land use of the given area, proximity of sensitive receptors, duration of construction activities, and presence or absence of barriers between noise source and receptor. In addition, construction noise levels would fluctuate depending on construction phase.

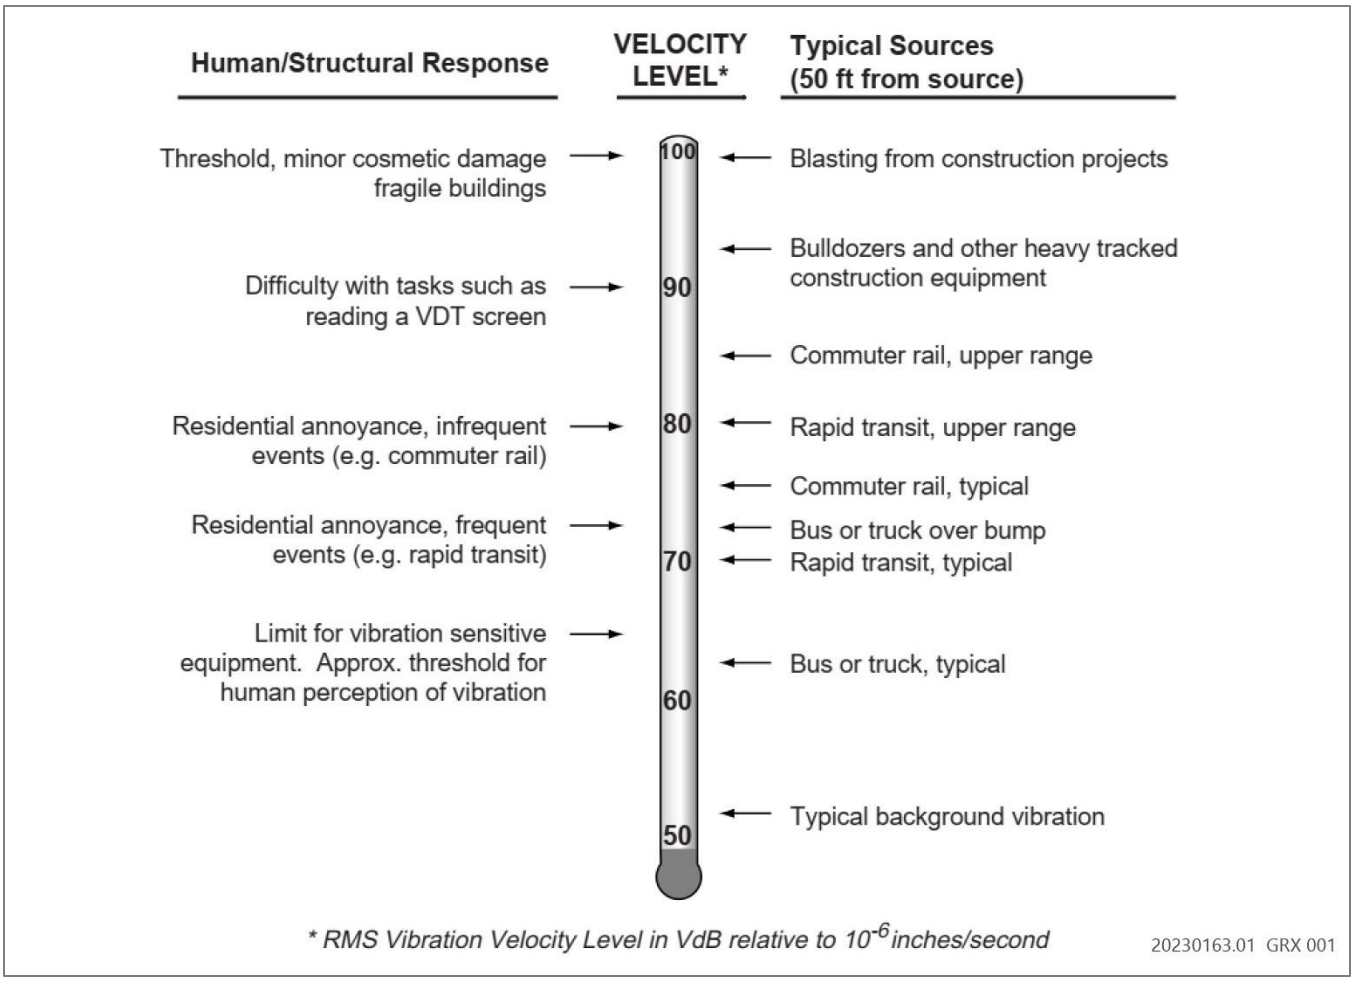
Noise levels from construction activities are typically considered point sources with typical attenuation rates of 6–7.5 dBA per doubling of distance, depending on the ground conditions, and additional attenuation provided by the presence of natural or human-made barriers or structures. Typically, construction projects involve ground conditions with a mix of acoustically soft and hard surfaces, or surfaces that fall somewhere between the two extremes (such as bare dirt); therefore, the 6 dBA attenuation rate is often conservatively assumed for construction noise impact analyses.

Commercial, Industrial, and Other Nontransportation Noise Sources

This category of ambient noise sources is extremely varied because it encompasses all the nontransportation noise sources resulting from the multitude of land uses throughout the Plan area. One major category of noise sources is mechanical equipment, which ranges from small residential heating, ventilation, and air conditioning (HVAC) units to large industrial systems with chillers, fans, compressor, cooling towers, and so forth. General noise sources associated with many different land uses include parking lot noise (e.g., opening and closing of vehicle doors, people talking, car alarms) and delivery activities (e.g., loading docks, use of forklifts, hydraulic lifts). Other noise sources include large machinery associated with industrial, manufacturing, and agricultural operations; municipal/utility operations (landfills, water treatment plants, power stations, etc.); activities at schools, parks, amphitheaters, and athletic facilities; landscape maintenance (leaf blowers and lawnmowers); and operations at port facilities. While these types of noise sources may be substantial contributors to the local ambient noise levels, their effects are generally localized and do not extend over a large geographical area in the same way as noise from transportation systems.

AMBIENT VIBRATION LEVELS AND EXISTING VIBRATION SOURCES

Background vibration is usually much lower than the threshold of human perception. The ambient vibration velocity level in residential areas is usually 50 VdB or lower, and the threshold of perception for humans is approximately 65 VdB. Low levels of background vibration are usually of concern only when the vibration affects sensitive manufacturing or research equipment (FTA 2018). Perceptible vibration is typically only part of the ambient environment at locations in proximity to specific notable vibration sources, such as uneven roads used by heavy vehicles, rapid transit lines, commuter or freight rail, or heavy industrial operations. Construction activities may also produce perceptible vibration, but these are usually short term rather than part of the permanent ambient environment. Figure 4.13-1 illustrates typical vibration velocity levels experienced by receivers in proximity to various vibration sources.



Source: FTA 2018.

Figure 4.13-1 Typical Levels of Groundborne Vibration

Existing vibration sources in the Plan area can be classified as transportation and nontransportation sources. Transportation sources include railroad train operations, including light rail, commuter, and freight trains. Nontransportation, or localized stationary/fixed sources, include construction equipment and heavy industrial machinery. Existing vibration exposure associated with these sources in the San Diego region is presented below.

Train/Rail Vibration

Rail lines, including light rail, rail rapid transit, commuter rail, and freight rail, generate vibration at land uses adjacent to their alignments. Train operations are intermittent, and rail lines are widely dispersed except for limited locations with a higher concentration of activity, such as freight rail/switching yards or transit centers where various railways converge (e.g., at the Santa Fe Depot in downtown San Diego). As a result, large parts of the Plan area experience little to no rail-related groundborne vibration or groundborne noise. Nonetheless, train operations generate substantial vibration levels in the immediate vicinity of the railways.

In the Plan area, a wide range of land uses (some vibration-sensitive) are located adjacent to railways. The FTA provides screening distances to estimate where significant vibration impacts may occur relative to various rail facilities. Some examples are provided in Table 4.13-5 (FTA 2018). The presence of sensitive receptors within these screening distances does not mean vibration impacts would occur, simply that FTA procedures require additional analysis under these conditions. The screening distances will identify most of the potentially impacted areas; however when there is evidence of efficient propagation (e.g., previous complaints about existing transit facilities or a history of problems with construction vibration), the distances in Table 4.13-5 should be increased by a factor of 1.5, in accordance with FTA guidance (FTA 2018: 135).

Table 4.13-5 Example FTA Screening Distances for Rail Vibration

Type of Project	Critical Distance for Land Use Categories[1]—Distance from Right-of-Way or Property Line (feet): Land Use Category 1	Critical Distance for Land Use Categories[1]—Distance from Right-of-Way or Property Line (feet) Land Use Category 2	Critical Distance for Land Use Categories[1]—Distance from Right-of-Way or Property Line (feet) Land Use Category 3
Conventional commuter railroad	600	200	120
Rail rapid transit	600	200	120
Light rail transit and streetcars	450	150	100
Intermediate capacity transit[2]	200	100	50
Bus projects (if not previously screened out)[3]	100	50	—

Notes: FTA = Federal Transportation Administration.

[1] For the vibration screening procedure, evaluate special buildings as follows:

Category 1 = concert halls and TV studios. Category 2 = theaters and auditoriums.

Land use category 1: High sensitivity (e.g., buildings where vibration-sensitive research and manufacturing is conducted, hospitals with vibration-sensitive equipment, and universities conducting physical research and operations).

Land use category 2: Residential (e.g., all residential land use and buildings where people normally sleep, such as hotels and hospitals).

Land use category 3: Institutional (e.g., institutions and offices that have vibration-sensitive equipment and have the potential for activity interference, such as schools, churches, and doctors' offices).

[2] Intermediate capacity transit is a transit system with less capacity than rail rapid transit but more capacity than typical bus operations, such as bus rapid transit, monorails, and trolleys (FTA 2018: 196).

[3] Projects that involve rubber-tire vehicles and do not involve roadway irregularity, operation close to vibration-sensitive buildings, or vehicles operating within buildings are not likely to result in a vibration impact and no further analysis is needed (FTA 2018: 134). These uses are considered "screened out."

Source: FTA 2018.

Construction Vibration

Construction activities generate temporary, short-term vibration levels. For large transportation projects, the total period of construction can be months or even years; however, these projects often have a large linear footprint (e.g., a stretch of freeway or railroad), which means that peak construction activities occur adjacent to any single receptor for only a limited portion of the total duration. Construction vibration is of more concern when it takes place near vibration-sensitive buildings or occurs at night or in early morning hours.

Vibration generated from construction equipment varies greatly depending on the construction activity being performed and the equipment being used. High-impact construction techniques, such as pile driving, blasting, and crack-and-seat pavement breaking, produce the highest vibration levels and typically dominate the local vibration environment when they occur (FTA 2018); however, these techniques are not required for all construction projects. Outside of high-impact techniques, heavy equipment operation (e.g., earthmoving) typically dominates the vibration generated at construction sites.

Because vibration impacts are assessed based on short-term metrics, such as the 1-second RMS vibration velocity level or the instantaneous PPV, the magnitude of the worst-case vibration level at any given receiver is typically dominated by the single most vibration-intensive task while it occurs closest to the individual receiver. Table 4.13-6 provides a list of typical construction equipment, the associated PPV (in/sec) at a reference distance of 25 feet, and the estimated distance to different levels of human response.

Table 4.13-6 Construction Equipment Vibration Levels (Peak Particle Velocity)

Equipment Item	Reference PPV at 25 Feet (in/sec)	Distance to Human Response (feet)[1] Barely Perceptible	Distance to Human Response (feet)[1] Distinctly Perceptible	Distance to Human Response (feet)[1] Strongly Perceptible	Distance to Human Response (feet)[1] Severe
Crack-and-seat operations	2.4[2]	3,646	1,034	450	128
Impact pile driver	0.65[2]	1,112	316	138	39
Vibratory pile driver	0.65[2]	1,112	316	138	39
Hydraulic breaker	0.24[2]	450	128	56	16
Vibratory roller	0.21[3]	399	113	50	14
Large bulldozer	0.089[3]	183	52	23	7
Caisson drilling	0.089[3]	183	52	23	7
Jackhammer	0.035[3]	79	23	10	3
Small bulldozer	0.003[3]	9	3	2	1

Notes: PPV = peak particle velocity; in/sec = inches per second.

[1] Distances are calculated using the Reference PPV (PPV_{ref}) at 25 feet. The equation used to calculate these distances is $PPV = PPV_{ref} * (25/D)$ (Caltrans 2020a).

Sources: Caltrans 2020a; FTA 2018.

Commercial, Industrial, and Other Nontransportation Vibration Sources

Outside of the transportation and construction sources described above, few vibration sources would affect the perceptible ambient conditions at sensitive receptors. Perceptible vibration from mechanical equipment and industrial machinery is primarily limited to the structures in which it occurs because it does not generate enough vibrational energy to propagate large distances. In addition, vibrating equipment is often treated at the source (for instance with vibration-damping mounts) specifically to minimize vibration transfer. Finally, local zoning and land use planning tend to protect against placing new vibration-sensitive uses in proximity to major industrial operations.

4.13.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

Some federal regulations provide specific quantitative noise limits (such as maximum permissible noise levels for specific vehicle types), whereas others provide requirements and guidance for noise-related programs to be prepared by others (such as requirements for noise contour maps and noise compatibility programs for public-use airports). Key federal regulations are briefly described below.

Federal Aviation Authority

Airport Noise Compatibility Planning

Title 14 of the Code of Federal Regulations (CFR), Part 150 is published by the Federal Aviation Authority (FAA) and prescribes the procedures, standards, and methodology governing the development, submission, and review of airport noise exposure maps and airport noise compatibility programs for public-use airports (including heliports). The Part 150 program (Airport Noise Compatibility Planning) proposes measures to reduce the land use incompatibility. Under the program, airport projects, such as land acquisition and acoustic treatment of residences, become eligible for federal funding. The Part 150 program establishes a voluntary program that airports can utilize to conduct airport noise compatibility planning, and the program prescribes a system for measuring airport noise impacts and presents guidelines for identifying incompatible land uses. Part 150 noise

exposure maps are depicted with annual average DNL contours around an airport. DNL is equivalent to L_{dn}, and similar to CNEL, as discussed in Section 4.13.1, "Existing Conditions"; FAA accepts California's use of CNEL.

Part 150 considers all land uses with noise levels less than 65 DNL to be compatible with aircraft operations. At higher noise exposures, selected land uses are also deemed acceptable, depending upon the nature of the use and the degree of structural noise attenuation provided. However, these designations do not constitute a federal determination that any use of land covered by the Part 150 program is acceptable or unacceptable under federal, state, or local law; the responsibility for determining the acceptable and permissible land uses and the relationship with specific noise contours rests with the local authorities.

Federal Highway Administration and Environmental Protection Agency

Traffic Noise Impacts

CFR Title 23, Part 772 is published by the FHWA and is the federal regulation governing traffic noise impacts. A federal or federally funded project would have a traffic noise impact if the project involved the construction of a new highway or the significant modification of an existing freeway (a "Type I"[1] project) where the project would result in a substantial operational noise increase, or when the predicted operational noise levels approach or exceed the FHWA noise abatement criteria (NAC). A "substantial increase" is not specifically defined by FHWA but is indicated to be in the range of 5–15 dBA (FHWA 2011). Specific increase criteria are defined by the state transportation agency (see discussion relating to Caltrans below). FHWA has developed NAC for activity categories at various noise-sensitive land uses as summarized in Table 4.13-7. Noise levels that "approach" the NAC are defined as 1 dBA less than the criterion level (i.e., 66 dBA L_{eq} for activity category B land uses).

Since 2007, Caltrans has performed federal responsibilities for National Environmental Policy Act (NEPA) compliance for highway projects in California that are funded by FHWA. This legal arrangement, referred to as NEPA Assignment, eliminates FHWA's project-specific review and approval. In reviewing and approving projects under NEPA, Caltrans is responsible for complying with all applicable federal environmental laws and with FHWA NEPA regulations, policies, and guidance, such as traffic noise regulations.

Noise Emission Standards for Rail

CFR Title 40, Part 201 and Title 49, Part 210 are closely interrelated. CFR Title 40, Part 201 is published by the US Environmental Protection Agency (EPA) and establishes noise emission standards for transportation equipment used by interstate rail carriers. Equipment covered by the regulation includes locomotives (under both operation stationary and moving conditions), rail cars, retarders, car-coupling operations, and locomotive load cell tests. CFR Title 49, Part 210 is published by the Federal Railroad Administration (FRA) and prescribes minimum compliance regulations for enforcement of 40 CFR 201.

Noise Emission Standards for Trucks and Motorcycles

CFR Title 40, Part 205 is also published by the EPA and establishes noise emission standards for medium and heavy-duty trucks, motorcycles, and motorcycle exhaust systems.

[1] Type I projects include:
1. the construction of a highway on new location; or
2. the physical alteration of an existing highway where there is either:
   a. substantial horizontal alteration.; or
   b. substantial vertical alteration; or
3. the addition of a through-traffic lane(s) including the addition of a through-traffic lane that functions as a high-occupancy vehicle (HOV) lane, high-occupancy toll (HOT) lane, bus lane, or truck climbing lane; or
4. the addition of an auxiliary lane, except for when the auxiliary lane is a turn lane; or
5. the addition or relocation of interchange lanes or ramps added to a quadrant to complete an existing partial interchange; or
6. restriping existing pavement for the purpose of adding a through-traffic lane or an auxiliary lane; or
7. the addition of a new or substantial alteration of a weigh station, rest stop, ride-share lot, or toll plaza. (FHWA 2011)

Table 4.13-7 FHWA Noise Abatement Criteria[1]

Activity Category	Activity $L_{eq(h)}$	Criteria $L_{10(h)}$ [2]	Evaluation Location	Description of Activities
A[3]	57	60	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B[3]	67	70	Exterior	Residential
C	67	70	Exterior	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52	55	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E	72	75	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A–D or F.
F	—	—	—	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, ship-yards, utilities (water resources, water treatment, electrical), and warehousing.
G	—	—	—	Undeveloped lands that are not permitted.

Notes: FHWA = Federal Highway Administration; $L_{eq(h)}$ = equivalent sound level over a 1-hour period; $L_{10(h)}$ = equivalent sound level over a 10-hour period.

[1] Hourly A-weighted sound levels decibels (dBA); either $L_{eq(h)}$ or $L_{10(h)}$ (but not both) may be used on a project.

[2] The $L_{eq(h)}$ and $L_{10(h)}$ activity criteria values are for impact determination only, and are not design standards for noise abatement measures.

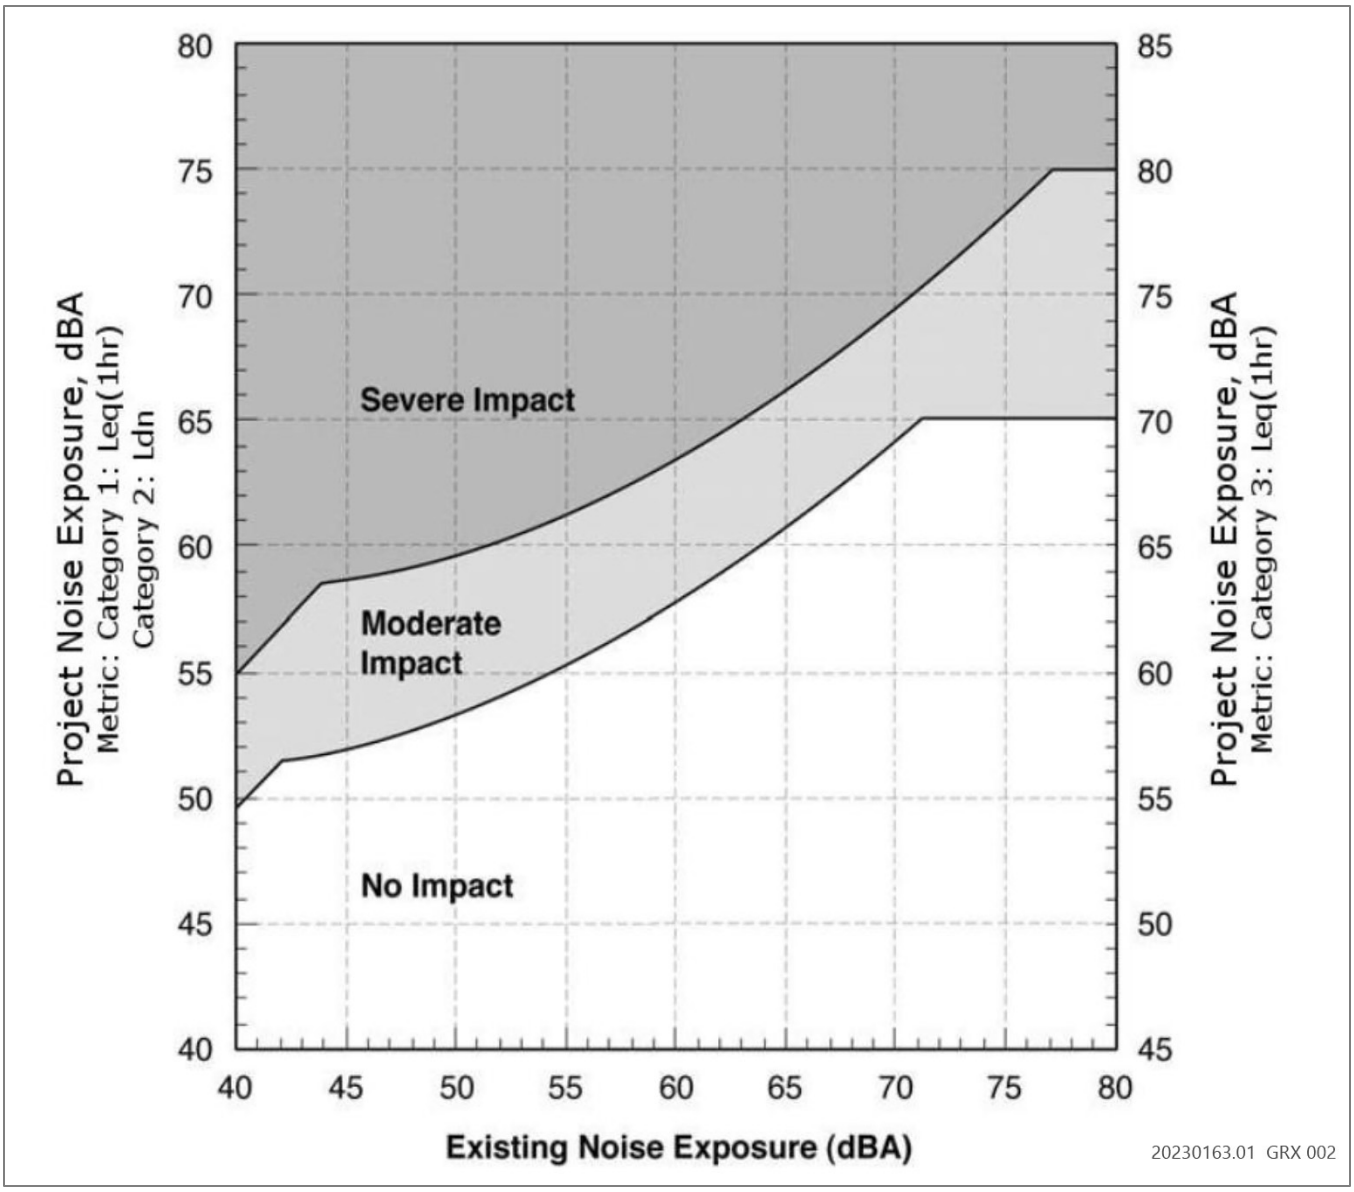
[3] Includes undeveloped lands permitted for this activity category.

Source: 23 CFR Part 772.

Federal Transit Administration and Federal Railroad Administration

FTA has prepared the *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018) that presents procedures for predicting and assessing noise and vibration impacts of proposed mass transit projects. The FTA manual was originally published in 1995 and subsequently updated in 2006 and again in 2018. The manual establishes FTA's methodology for addressing potential noise impacts under NEPA and 23 CFR 771 and is generally required for federal or federally funded transit projects (analysis is not required for projects classified as categorical exclusions). FRA has adopted the FTA methodologies and significance criteria for its own guidance manual, *High-Speed Ground Transportation Noise and Vibration Impact Assessment* (FRA 2012) for predicting and assessing noise and vibration impacts of proposed high-speed ground transportation projects (including high-speed trains using traditional steel-wheel on steel-rail technology, as well as magnetically levitated [maglev] systems). The FRA manual was originally published in 1998 and subsequently updated in 2012.

FTA and FRA noise impact thresholds are based on a project's incremental long-term operational noise increase relative to existing noise conditions. Project operational noise levels are divided into three categories (no impact, moderate impact, and severe impact) as illustrated in Figure 4.13-2. While higher project noise levels are permitted in areas with higher existing ambient conditions, the thresholds are designed to limit the total noise increase, with the smallest allowable increase at locations already affected by the highest existing noise levels.



Source: FTA 2018.

Figure 4.13-2 FTA Noise Impact Criteria for Noise-Sensitive Uses (dBA)

Construction Noise

According to the FTA manual, "[p]roject construction noise criteria should take into account the existing noise environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land use" (FTA 2018: 172). Although FTA does not specify standardized criteria for construction noise impacts, it provides varying guidelines to be considered on a case-by-case basis depending, in part, on the level of detail available regarding the anticipated construction activities and schedule.

Groundborne Noise and Vibration

The FTA manual also provides groundborne noise and vibration criteria for both project operations and construction. For operational vibration, the criteria are based on the potential for human annoyance and activity interference. The general criteria are summarized in Table 4.13-8.

Table 4.13-8 Groundborne Vibration and Groundborne Noise Impact Criteria for FTA General Assessment

Land Use Category	Groundborne Vibration Impact Levels Frequent Events[1]	Groundborne Vibration Impact Levels Occasional Events[2]	Groundborne Vibration Impact Levels Infrequent Events[3]	Groundborne Noise Impact Levels Frequent Events[1]	Groundborne Noise Impact Levels Occasional Events[2]	Groundborne Noise Impact Levels Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations.	65 VdB[4]	65 VdB[4]	65 VdB[4]	NA[5]	NA[5]	NA[5]
Category 2: Residences and buildings where people normally sleep	72 VdB	75 VdB	80 VdB	35 dBA	38 dBA	43 dBA
Category 3: Institutional land uses with primarily daytime use	75 VdB	78 VdB	83 VdB	40 dBA	43 dBA	48 dBA

Notes: FTA = Federal Transit Administration; VdB = vibration decibels; dBA = A-weighted decibels.

[1] "Frequent events" is defined as more than 70 vibration events of the same source per day. Most rapid transit projects fall into this category.

[2] "Occasional events" is defined as between 30 and 70 vibration events of the same source per day. Most commuter trunk lines have this many operations.

[3] "Infrequent events" is defined as fewer than 30 vibration events of the same kind per day. This category includes most commuter rail branch lines.

[4] This criterion limit is based on levels that are acceptable for most moderately sensitive equipment, such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors.

[5] Vibration-sensitive equipment is generally not sensitive to ground-borne noise.

Source: FTA 2018.

The FTA manual uses the following land use categories when determining transit noise and vibration impacts:

- Land use category 1: Tracts of land where quiet is an essential element in their intended purposes. This category includes lands set aside for serenity and quiet, and such land uses as outdoor amphitheaters and concert pavilions, as well as National Historic Landmarks with significant outdoor uses. Also included are recording studios and concert halls. The noise metric for category 1 is the outdoor 1-hour L_{eq} during the noisiest hour of activity.
- Land use category 2: Residences and buildings where people normally sleep. This category includes homes, hospitals, and hotels where nighttime sensitivity to noise is assumed to be of utmost importance. The noise metric for category 2 is the outdoor L_{eq} or CNEL.
- Land use category 3: Institutional land uses with primarily daytime and evening uses. This category includes schools, libraries, theaters, and churches where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material. Places for meditation or study associated with cemeteries, monuments, museums, campgrounds, and recreational facilities can also be considered in this category. Certain historical sites and parks are also included. The noise metric for category 3 is the outdoor 1-hour L_{eq} during the noisiest hour of activity.

Additional criteria are provided for various types of special buildings, such as concert halls, TV studios, recording studios, auditoriums, and theaters.

For vibration generated by construction, two types of potential impact are addressed: human annoyance and structural damage. Human annoyance from construction is assessed using the same general criteria discussed above for operational sources. FTA criteria for potential building damage are summarized in Table 4.13-9.

Table 4.13-9 FTA Construction Vibration Damage Criteria

Building Category	PPV (in/sec)
I. Reinforced-concrete, steel or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Notes: PPV = peak particle velocity; in/sec = inches per second.

Source: FTA 2018.

Department of Defense Instruction 4165.57

Department of Defense Instruction 4165.57 establishes policy, assigns responsibilities, and prescribes procedures for the Department of Defense Air Installations Compatible Use Zones (AICUZs) program for military air installations. It also establishes policy and assigns responsibility for educating air installation personnel and engaging local communities on issues related to noise, safety, and compatible land use in and around air installations, and prescribes procedures for plotting noise contours for land use compatibility analysis. The noise compatibility criteria are basically the same as those indicated by the FAA in 14 CFR 150. As a result, AICUZ compatibility standards identify residential land uses as being compatible with aircraft noise levels of up to 65 dBA CNEL.

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

California State Aeronautics Act

The California State Aeronautics Act (SAA), under Public Utilities Code (PUC), Section 21001 et seq., was established "to protect the public interest in aeronautics and aeronautical progress." Airport land use compatibility planning, as required by the SAA, outlines the statutory requirements for airport land use commissions (ALUCs) including the preparation of ALUCPs for each public-use airport in California. The Caltrans Division of Aeronautics administers much of the SAA and provides guidance for meeting the baseline safety and compatibility requirements.

Airport Land Use Compatibility Plans

The State requires that the San Diego County Regional Airport Authority (SDCRAA), as the ALUC, prepare ALUCPs for each public-use and military airport in San Diego County, as directed in PUC Section 21675. An ALUCP contains policies and criteria that address compatibility between airports and future land uses that surround them by addressing noise, overflight, safety, and airspace protection concerns to minimize the public's exposure to excessive noise and safety hazards within the airport influence area for each airport over a 20-year horizon.

ALUCPs include airport runway noise level contours typically in 5 dB increments between 50 and 75 dBA CNEL. The range varies depending on the size of the airport. These noise contours reflect the existing and anticipated growth of the airport for at least the next 20 years and include potential development planning. ALUCPs provide noise compatibility criteria, typically in the form of a table or matrix that lists various different land uses and categorizes their compatibility across a range of different noise levels in 5 dB increments. The acceptability of each land use to each 5 dB noise range is categorized as either "compatible," "conditionally compatible," or "incompatible."

Noise Insulation Standards

The California Noise Insulation Standards in Title 24 of the California Code of Regulations (CCR) set requirements for new residential units, hotels, and motels that may be subject to relatively high levels of transportation-related noise. For areas with exterior noise levels greater than 60 dBA, the noise insulation standard is 45 dBA in any habitable room; an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard is required where such units are proposed in such areas. CCR Title 24, Part 2, Section 1207.11.2 states, "[t]he noise metric must be either the L_{dn} or the CNEL, consistent with the noise element of the local general plan."

California Department of Transportation

Caltrans manages California's highways and freeways, provides intercity rail services, and permits public-use airports and special-use hospital heliports. Caltrans has programs and divisions with policies or regulations, including Aeronautics, Highway Transportation, Rail, and Mass Transportation. The Caltrans Division of Rail uses FRA and FTA noise criteria and methodologies for assessing rail-related noise or vibration impacts. The Caltrans Division of Aeronautics is responsible for licensing and permitting programs for airports and heliports. Assistance for the development and maintenance of aviation facilities through engineering and aviation experience is also provided, as well as systems planning and environmental and community service programs. Caltrans provides numerous noise and vibration impact guidance documents for traffic noise, rail noise, airport noise, construction noise, and vibration, including the following.

- *Technical Noise Supplement to the Traffic Noise Analysis Protocol* (Caltrans 2013)
- *Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction, and Retrofit Barrier Projects* (Caltrans 2020b) ("Protocol")
- *California Airport Land Use Planning Handbook*. Division of Aeronautics (Caltrans 2011)
- *Transportation and Construction Vibration Guidance Manual* (Caltrans 2020a)

Traffic Noise Guidance

As described previously, Caltrans is responsible for implementing 23 CFR 772 for federal or federally funded highway projects under NEPA Assignment. Therefore, the Protocol uses the same NAC as presented in 23 CFR 772 and provides further details on the policies and procedures to be used in conducting applicable traffic noise studies in California. Traffic noise impacts as defined occur when the predicted noise level in the design year approaches or exceeds the NAC, or a predicted noise level substantially exceeds the existing noise level (a "substantial" noise increase). In California, a substantial noise increase for these projects is considered to occur when the project's predicted worst-hour design-year traffic noise level exceeds the existing worst-hour traffic noise level by 12 dBA or more. The use of 12 dBA is based on the concept that a 10 dBA increase generally is perceived as a doubling of loudness (Caltrans 2020b).

According to the Protocol, the significance of noise impacts for Caltrans CEQA documents (e.g., for projects that are subject to Caltrans oversight but are not subject to NEPA because there is no federal funding) is based on the project-related increase in noise and other project-specific conditions (but not the NAC). No single numerical threshold is used on all projects, and the project threshold is developed by the project team on a case-by-case basis. The Caltrans definition for a substantial increase in noise (i.e., a 12 dBA increase between existing and design-year with-project conditions) has been used, but there would be cases where an increase less than 12 dBA would approach significance (such as a quiet rural environment) or where a 12 dBA increase would not necessarily be deemed significant (noisy urban environment) (Caltrans 2020b).

Construction Noise

As presented in the Protocol, Section 14-8.02, "Noise Control of Caltrans Standard Specifications" establishes a construction noise exposure/production limit of 86 dBA L_{max} at 50 feet from the job site from 9:00 p.m. to 6:00 a.m.

Airport Noise Guidance

Caltrans Division of Aeronautics prepared the *California Airport Land Use Planning Handbook* (Handbook), which provides guidance for conducting airport land use compatibility planning, most notably for the preparation, adoption, and amendment of an ALUCP (Caltrans 2011). The Handbook provides a checklist of typical ALUCP contents, which includes scope of the ALUCP, airport information, compatibility policies and criteria, compatibility zone maps (including CNEL contours), review policies, preliminary review of plans and projects, land use information, compatibility issues, local government implementation, and supporting materials (Caltrans 2011).

Vibration

Caltrans provides guidelines for the analysis of groundborne vibration relating to transportation and construction-induced vibration, including guideline criteria for potential building damage and human annoyance, as shown in Tables 4.13-10 and 4.13-11.

Table 4.13-10 Caltrans Guideline Vibration Building Damage Criteria

Structure and Condition	Maximum PPV (in/sec) Transient Sources	Maximum PPV (in/sec) Continuous/ Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Notes: PPV = peak particle velocity; in/sec = inches per second. Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

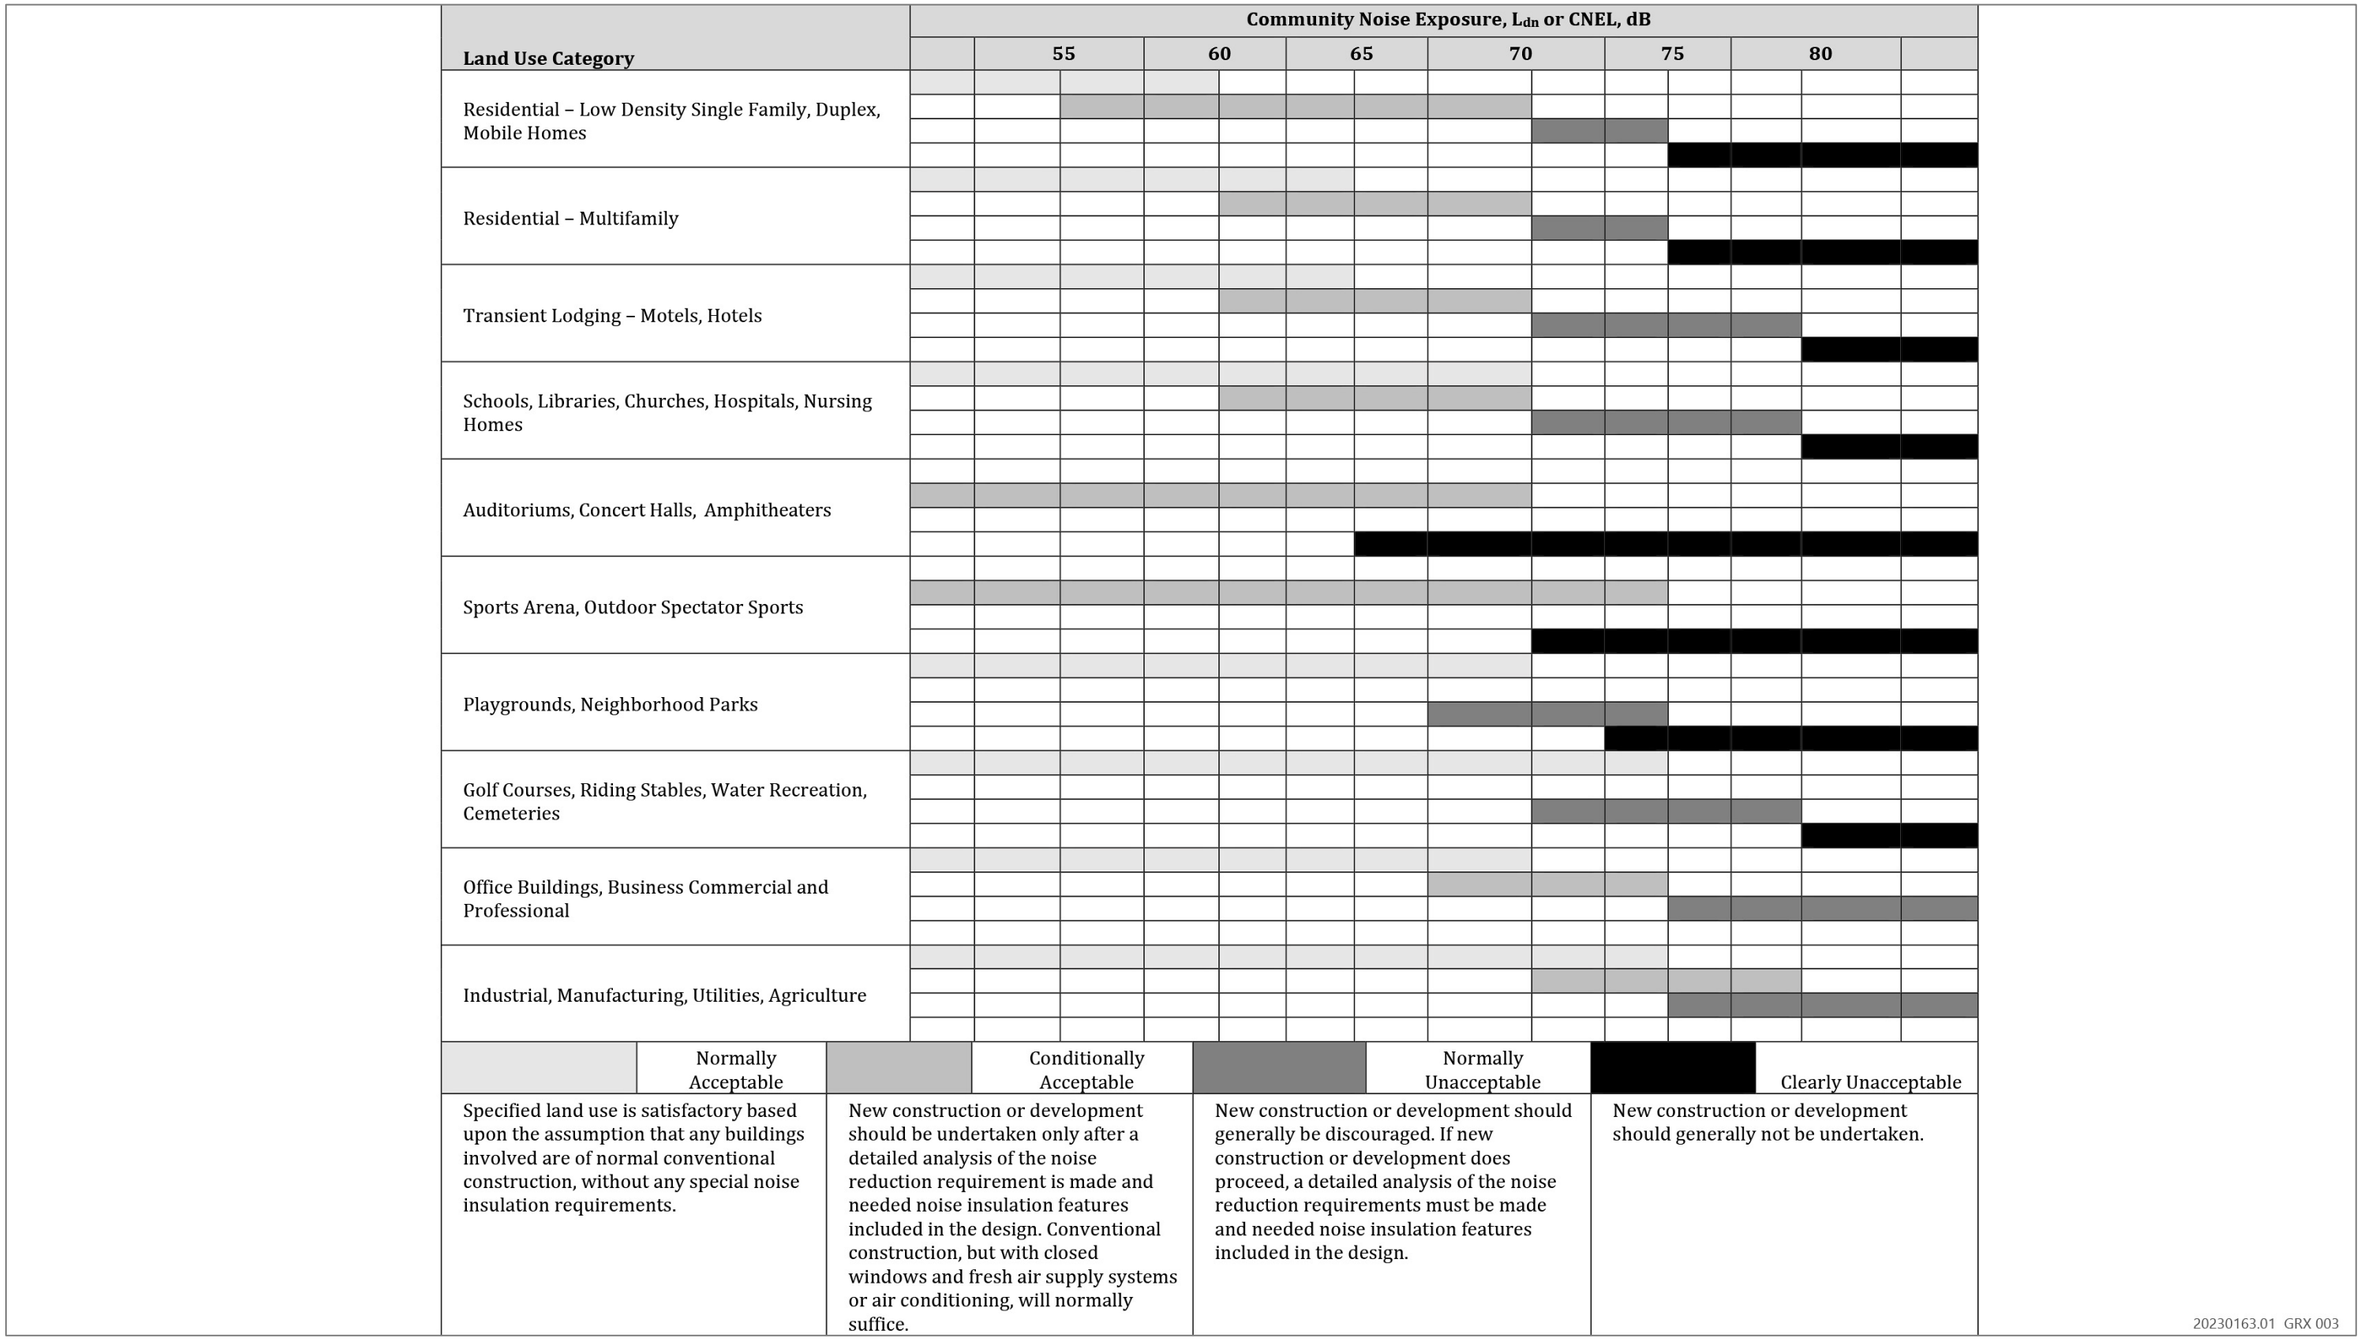
General Plan Guidelines

The Governor's Office of Planning and Research (OPR) (now known as the Governor's Office of Land Use and Climate Innovation) is required to adopt and periodically revise guidelines for the preparation and content of local general plans. OPR's 2017 State of California General Plan Guidelines include noise/land use compatibility guidelines, which are shown in Figure 4.13-3.

LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

General Plan Noise Elements

Local jurisdictions (cities and the County of San Diego) within the Plan area adopt a noise element as part of their general plan to identify, appraise, and remedy noise in local communities. Noise elements analyze and quantify current and projected noise levels associated with local noise sources, including, but not limited to, highways and freeways, primary arterials and major local streets, rail operations, air traffic associated with airports, local industrial and commercial land uses, and other ground stationary sources that contribute to the community noise environment. Beyond statutory federal standards, local jurisdictions can adopt their own noise goals and policies in their noise elements or adopt noise and land use compatibility guidelines similar to or the same as those recommended by the State (see Figure 4.13-3).



Note: OPR = Governor's Office of Planning and Research (now known as Governor's Office of Land Use and Climate Innovation).
Source: OPR 2017.

Figure 4.13-3 OPR Noise/Land Use Compatibility Guidelines

The County of San Diego and all the cities in the San Diego region, apart from Del Mar and Oceanside, have adopted the 2017 OPR Noise and Land Use Compatibility Guidelines as their land use compatibility noise standards, including the 60 dBA CNEL "normally acceptable" noise level for residential uses. The cities of Del Mar and Oceanside have adopted 65 dBA CNEL as the maximum noise level compatible with residential land uses (City of Del Mar 1985; City of Oceanside 2002). For the purposes of assessing noise impacts, standards in the noise element are commonly applied to transportation noise sources. The assessment of nontransportation noise levels is typically based on standards provided in the municipal code.

Local Noise/Vibration Ordinances/Municipal Code

In addition to noise element policies of general plans, local jurisdictions regulate noise through enforcement of their noise ordinances, which are typically contained in the municipal code. Many noise ordinances provide separate standards to control noise from construction activities that typically include a combination of construction noise level limits and restrictions on the hours during which construction is permitted. Tables 4.13-12 and 4.13-13 summarize the municipal noise level limits and the construction noise regulations, respectively, for each jurisdiction within the San Diego region. Some local jurisdictions also have regulations related to vibration, as summarized in Table 4.13-14.

Table 4.13-14 Summary of Local Vibration Standards

Jurisdiction	Municipal Code/General Plan	Vibration Regulation
Carlsbad	21.34.090	All industrial uses shall comply with the following performance standards: All uses shall be so operated as not to generate vibration discernible without instruments by the average person while on or beyond the lot upon which the source is located or within an adjoining enclosed space if more than one establishment occupies a structure. Vibration caused by motor vehicles, trains and temporary construction is exempted from this standard.
Chula Vista	19.68.050	Vibration. Operating or permitting the operation of any device that creates a vibration which is above the vibration perception threshold of any individual at or beyond the property boundary of the source if on private property or at 150 feet from the source if on a public space or public right-of-way.
County of San Diego	General Plan Policy N-3.1	N-3.1 Groundborne Vibration. Use the Federal Transit Administration and Federal Railroad Administration guidelines, where appropriate, to limit the extent of exposure that sensitive uses may have to groundborne vibration from trains, construction equipment, and other sources.
El Cajon	17.115.130	Every use shall be so operated that the ground vibration generated by such use is not harmful or injurious to the use or development of surrounding properties. No vibration shall be permitted which is perceptible without instruments at any use along the property line on which such use is located. For the purpose of this determination, the boundary of any lease agreement or operating unit or properties operating as a unit shall be considered the same as the property line.
Encinitas	30.40.010	Every use shall be so operated that the ground vibration generated at any time and measured at any point along the lot line of the lot on which the use is located shall not be perceptible and shall not exceed the vibration levels set forth in the regulation.
Lemon Grove	17.24.080	Vibrations. No detectable vibrations shall be permitted off the development site.
National City	12.10.180	It is unlawful to operate or permit the operation of any device that creates a vibration which exceeds the vibration perception threshold at or beyond the property boundary of the source originates on private property, or at a distance of one hundred fifty feet or more from the source if originating from a location on a public space or public right-of-way. Vibration that occurs as an incidental result of sound generation shall not be governed by this section only, but also by the prohibitions or restrictions applicable to the source of the sound.

Jurisdiction	Municipal Code/General Plan	Vibration Regulation
San Marcos	20.300.070	Vibration may disturb the conduct of certain activities and create discomfort for some individuals. To minimize the disturbance and inconvenience from vibrations, no person or use shall create, maintain, or cause ground vibration that is discernible without instruments to a person of normal sensitivity at any point on a property that is adjacent to the property of the vibration source. The ground vibration caused by moving vehicles, trains, aircraft, or temporary construction or demolition is exempted.
Santee	13.30.030	Vibration. No operation or activity is permitted which will create vibration noticeable without instruments at the perimeter of the subject property.

San Diego County Regional Airport Authority

In the San Diego region, the relationships of transportation, transit, and mobility, and of population growth to noise associated with aircraft in flight are the responsibility of the SDCRAA, established under state law to protect the safety and welfare of the general public and the ability of airports to operate now and in the future (SDCRAA 2025). One of the SDCRAA responsibilities is to serve as the ALUC for San Diego and create, adopt, and update the airport land use compatibility plans (ALUCPs) for the region's 16 public-use and military airports in accordance with applicable state and federal laws, consisting of the following airports (with year of the latest update):

- Agua Caliente Springs Airport (2022),
- Borrego Valley Airport (2022),
- Brown Field (2010),
- Fallbrook Community Airpark (2022),
- Gillespie Field (2010),
- Jacumba Airport (2022),
- MCAS Camp Pendelton (2008),
- MCAS Miramar (2011),
- McClellan-Palomar Airport (2011),
- Montgomery Field (2010),
- Naval Air Station North Island (2020),
- Naval Outlying Landing Field – Imperial Beach (2015),
- Oceanside Municipal Airport (2010),
- Ocotillo Airport (2022),
- Ramona Airport (2022), and
- San Diego International Airport (2014).

The other remaining airports in the San Diego region include Tijuana International Airport (under the authority of Mexico), Coast Guard Air Station San Diego (military airfield), and Pauma Valley Airport (private airfield), which are not required to prepare an ALUCP. The adopted ALUCPs of public-use airports in the San Diego region include an analysis of the existing and future aircraft noise level contours to assist local agencies in developing land use plans for areas surrounding the airports. ALUCPs differentiate allowed and prohibited land uses according to noise and land use compatibility guidelines. AICUZ studies also include contour maps, which are included in the noise element of general plans of each jurisdiction affected by public-use and military airports and are considered in the development of land use plans at the local level.

4.13.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for evaluating the significance of a project's environmental impacts on noise, in the form of initial study checklist questions. Checklist questions for noise and vibration are provided in Section XIII of the CEQA Guidelines Appendix G. The significance criteria specifically developed for this EIR are based on the checklist questions that address the criteria in CEQA Guidelines Appendix G. For the purposes of this EIR, the proposed Plan would have a significant noise impact if it would result in:

NOI-1 Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies; or generate a substantial absolute increase in ambient noise.

NOI-2 Generation of excessive groundborne vibration or groundborne noise levels.

NOI-3 For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public-use airport, the project would expose people residing or working in the project area to excessive noise levels.

The analysis discloses impacts to noise and vibration. There is insufficient evidence to support a meaningful analysis of how the proposed Plan's noise and vibration impacts would be worsened by climate change. Therefore, a climate change analysis for noise and vibration impacts is not included in this section.

4.13.4 Environmental Impacts and Mitigation Measures

NOI-1 GENERATION OF A SUBSTANTIAL TEMPORARY OR PERMANENT INCREASE IN AMBIENT NOISE LEVELS IN THE VICINITY OF THE PROJECT IN EXCESS OF STANDARDS ESTABLISHED IN THE LOCAL GENERAL PLAN OR NOISE ORDINANCE, OR APPLICABLE STANDARDS OF OTHER AGENCIES; OR GENERATE A SUBSTANTIAL ABSOLUTE INCREASE IN AMBIENT NOISE.

Analysis Methodology

This section discusses the construction and operations noise impacts of forecasted regional growth and land use change and planned transportation network improvements and programs. Due to the programmatic nature of the proposed Plan, the precise locations, construction techniques, extent of individual site development, and project timelines are currently unknown. Thus, for construction impacts this analysis uses reference noise levels associated with two of the loudest pieces (i.e., an impact pile driver and a bulldozer) of common construction equipment (Table 4.13-4) that could be used simultaneously during construction activities to model construction noise levels associated with the types of projects anticipated to be developed under the proposed Plan. The modeling results were used to assess potential short-term construction-related noise impacts. Construction source noise levels were determined based on methodologies, reference emission levels, and usage factors from the FTA manual (FTA 2018) and FHWA *Roadway Construction Noise Model User's Guide* (FHWA 2006). See Appendix L for detailed construction noise modeling inputs. Reference noise levels for specific equipment and activity types are well documented, and the usage thereof is common practice in the field of acoustics.

A comprehensive review of construction noise standards established by cities and counties within the proposed Plan area was conducted. As shown in Table 4.13-13, some noise ordinances contain performance standards for construction equipment relative to the surrounding land use and time of day (e.g., National City Municipal Code Section 12.10.160), and some establish limitations for consecutive construction workdays after which notice must be provided to surrounding property owners and residents (i.e., City of Santee Municipal Code Section 5.04.090). Most jurisdictions establish restrictions on construction-related activities during certain hours of the day. In addition, as shown in Table 4.13-13, most jurisdictions in the region that established a construction noise level limit set this limit at 75 dBA L_{eq}, and thus this noise level is used in this analysis as a threshold to evaluate the potential effects of construction noise associated with development implementing regional growth and land use

changes under the proposed Plan. Projects under the proposed Plan would have a significant impact if associated construction noise exceeded 75 dBA L_{eq}, measured at the property line of the nearest sensitive receptor, or as otherwise determined by the local jurisdiction.

Projects under the proposed Plan with federal involvement or located on the state highway system would be required to comply with specific noise standards of the respective agency (i.e., FTA, Caltrans). Caltrans establishes a construction noise production limit of 86 dBA L_{max} at 50 feet from the jobsite (Caltrans 2020b); thus, construction noise resulting from implementation of the proposed Plan is also evaluated using this noise level as the threshold above which construction noise associated with transportation network improvements would be considered significant, as measured at the nearest receptor. FTA limits the total noise increase from existing noise levels and FHWA suggests that a 5 to 15 dBA increase could be considered substantial (FHWA 2011). In this analysis, a substantial increase in ambient noise from construction activities is defined as an increase in 5 dBA or more above ambient levels, as this is generally perceived as a distinctly noticeable noise increase (Caltrans 2013: 2-10). However, because the exact locations of projects associated with the proposed Plan are currently unknown, in this analysis, compliance with FTA and FHWA substantial noise increase standards is assessed qualitatively.

Local operations noise standards, determined at the project level, may apply to regional growth and land use change, as well as to local transportation network improvements and programs. As outlined under "Local Laws, Regulations, Plans, and Policies," these local standards are typically supplied by the local noise element (noise/land use compatibility) and municipal code. A comprehensive review of noise standards established by jurisdictions within the proposed Plan area was conducted. As shown in Table 4.13-12, residential daytime noise standards typically range from 45 to 60 dBA L_{eq}. As stated above, the County of San Diego and all the cities in the San Diego region, apart from Del Mar and Oceanside, have adopted the 2017 OPR Noise and Land Use Compatibility Guidelines as their land use compatibility noise standards, including the 60 dBA CNEL "normally acceptable" noise level for residential uses. The cities of Del Mar and Oceanside have adopted 65 dBA CNEL as the maximum noise level compatible with residential land uses (City of Del Mar 1985; City of Oceanside 2002). Local jurisdictions do not typically provide impact thresholds to guide CEQA analysis of construction and operations noise impacts that would cause temporary or permanent increases in ambient noise levels at sensitive receptors. Rather, the noise levels are considered substantial when they exceed the applicable regulatory standard.

In addition, certain project types would be subject to the requirements or guidelines of other (regional, state, or federal) agencies including:

- Caltrans/FHWA traffic noise criteria for federal and federally funded highway projects;
- Caltrans substantial noise increase standards for state highway projects or local roadway projects with Caltrans oversight that are not subject to NEPA;
- Caltrans construction noise criteria and specifications;
- FTA criteria (for construction and operations noise) for federal or federally funded, rail, high-speed rail, and other transit projects; and
- ALUCP or AICUZ criteria for public-use and military airports (discussed under threshold NOI-3, below).

Detailed quantitative analyses of potential impacts associated with implementation of the proposed Plan are not practical given the programmatic nature of the proposed Plan and the lack of specific project details. Therefore, the analysis of construction and operations noise impacts is largely qualitative and, where possible, is supplemented with published data or sample calculations to illustrate the points discussed in the analysis.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted to increase by 117,056 people (3.6%), 137,242 housing units (11.1%), and 67,297 jobs (4.2%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. To accommodate regional growth by 2035, new development, including housing units, commercial areas, industrial centers, and civic facilities, would be constructed. New development would occur throughout the region and could result in new or increased temporary and operations noise at nearby land uses. Noise effects would be variable and dependent on the location of improvements relative to the land uses, presence of shielding between the sources and receiver, and the existing ambient noise level from other nearby noise sources.

Construction noise is an unavoidable result of planned growth within a given location, and implementation of the proposed Plan's forecasted land use growth would be expected to generate short-term noise increases during construction. Short-term construction noise levels would fluctuate depending on the type, quantity, and duration of usage of the various types of heavy-duty equipment. Because of the regional scale of the proposed Plan and the programmatic level of this analysis, specific construction-related details (e.g., location, schedule) for individual land use projects are not available. Construction of projects under the proposed Plan would require the use of conventional construction equipment (e.g., bulldozers, graders, backhoes) that generate noise in the immediate vicinity of the source, often resulting in temporary noise levels that are substantially higher than existing conditions. In addition to the use of conventional construction equipment, depending on the soil type and development height, some projects under the proposed Plan could require the use of high impact construction equipment, such as pile drivers. As discussed above in Section 4.13-1, "Existing Conditions," noise levels, including construction-related noise, dissipate rapidly from the source. Thus, sensitive land uses closest to construction activities are typically of greatest concern when evaluating construction noise. However, when the use of high-impact equipment (e.g., for pile driving or rock drilling) is necessary, a temporary increase in noise would occur at nearby development as well as at land uses farther away.

Table 4.13-4 summarizes typical construction noise levels for various construction activities. As shown in Table 4.13-4, construction equipment noise levels range from 70 dBA L_{eq} (generator more than 25 kilovolt amps [kVA]) to 94 dBA L_{eq} (impact pile driver) at 50 feet (FHWA 2006). As described above under "Analysis Methodology," the simultaneous operation of two of the loudest pieces of construction equipment (i.e., an impact pile driver and a bulldozer) that could be used simultaneously during construction activities are assumed. As shown in Table 4.13-13, most jurisdictions in the region establish a construction noise level limit of 75 dBA L_{eq}. Therefore, this noise level is used as a threshold to evaluate potential construction noise effects associated with land use growth. Noise levels associated with the simultaneous operation of a bulldozer and impact pile driver would attenuate to 75 dBA L_{eq} at 71 feet and 446 feet, respectively (see Appendix L for detailed modeling inputs). Thus, depending on the proximity to existing sensitive land uses, duration of construction activities, and types of equipment required, construction-related noise levels could exceed applicable local construction-related noise standards and thresholds.

In addition to short-term construction noise, regional growth and land use change could result in new operations noise sources and increased operations noise levels. As shown in Table 4.13-12, residential daytime noise standards established by jurisdictions within the region range from 45 to 60 dBA L_{eq}, and nighttime noise standards range from 40 to 50 dBA L_{eq}. As previously described, the effects of operations noise would be variable and dependent on the types of sources (e.g., loading docks, HVAC equipment), noise levels generated by such sources, distances to noise-sensitive receptors, the presence of shielding (e.g., existing structures) between the sources and receiver, and the existing ambient noise levels. However, the extent of new stationary noise from these land uses cannot

currently be quantified because the quantity, magnitude, and specific location of specific stationary noise sources are unknown. Development projects associated with the proposed Plan would be required to adhere to local standards pertaining to setbacks, permissible hours of operation, and noise, which could limit the exposure of existing sensitive receptors to excessive noise levels or substantial (e.g., 5+ dBA) increases in noise. Although adherence to applicable noise standards could reduce noise exposure at nearby sensitive receptors, in certain locations, noise associated with new stationary noise sources could exceed an acceptable noise standard or result in a permanent substantial (e.g., 5+ dBA) noise increase in noise at nearby land uses.

As discussed in Section 4.13.2, "Regulatory Setting," federal, state, and local regulations exist that reduce the potential for noise impacts during construction and operations of new land uses by establishing noise standards specific to the noise source, limiting construction and operations activities during sensitive times of day (i.e., evening and nighttime), and requiring the implementation of measures, when necessary, to reduce adverse effects from increased noise. Several local jurisdictions have adopted allowable noise limits specifically for construction activities (e.g., City of Coronado, City of Encinitas), and almost all jurisdictions limit construction activities to times when noise would have the least effect on nearby land uses (i.e., during the daytime). Adherence to applicable noise regulations would be required during construction and operations to minimize the potential for adverse effects from increased noise. Although adherence to applicable regulations would be required and would reduce noise impacts associated with land use growth, construction and operations noise levels could exceed applicable thresholds, and could substantially increase from ambient levels. Therefore, impacts of regional growth and land use change as they relate to noise would be significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

Transportation network improvements by 2035 would include arterial improvements, development of circulator routes, highway intersection improvements, and multimodal corridor improvements. Upgrades to certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

The construction of transportation network improvements would require the use of heavy construction equipment (e.g., bulldozers, graders, backhoes) and high-impact equipment (e.g., pile drivers, rock drilling equipment). Transportation improvement projects typically progress in a linear fashion (i.e., along the right-of-way), and thus elevated noise levels would occur only temporarily in the location where the construction occurs before moving along the right-of-way. However, construction is sometimes required during evening and nighttime hours to accommodate time-sensitive activities (e.g., concrete pours) or to minimize traffic congestion during peak travel periods. Therefore, construction activities could affect nearby sensitive receptors for shorter periods of time as construction moves along the linear right-of-way but could result in greater disturbance if construction were to occur during evening and nighttime hours.

As described above, most jurisdictions in the region establish a construction noise level limit of 75 dBA L_{eq}. To determine the effects of construction noise generated by transportation improvement projects, two of the loudest pieces of construction equipment (i.e., an impact pile driver and a bulldozer) that could be used simultaneously during construction activities are assumed. Noise levels associated with the simultaneous operation of a bulldozer and impact pile driver would attenuate to 75 dBA L_{eq} within 71 feet and 446 feet, respectively (see Appendix L for

detailed modeling inputs). Thus, construction-related noise levels could exceed local construction-related noise standards depending on proximity to existing land uses and duration of construction activities. Transportation network improvement projects with federal involvement or located on the state highway system would be required to comply with the specific noise standards of the respective agency. As detailed in Section 4.13.2, "Regulatory Setting," Caltrans establishes a construction noise production limit of 86 dBA L_{max} at 50 feet from the jobsite. Noise levels associated with the operation of a bulldozer and impact pile driver would attenuate to 86 dBA L_{max} within 32 feet and 281 feet, respectively (see Appendix L for detailed modeling inputs).

FTA construction noise criteria define a substantial noise increase based on existing noise levels. Although specific construction-related details (e.g., location, schedule, equipment) for individual projects under the proposed Plan are unknown, construction activity could result in a substantial (e.g., 5+ dBA) increase over existing noise levels. Projects under the proposed Plan that meet the definition of a Type I project (as defined in Section 4.13.1), such as a federal or federally funded highway project that involves the widening of an existing highway, would be subject to the requirements of 23 CFR 772. In addition to outlining procedures for analyzing traffic and construction noise impacts, 23 CFR 772 establishes requirements for developing and implementing noise abatement measures to reduce traffic noise impacts on federal or federally funded highway projects. If a project were to meet the definition, it would require noise analysis regardless of any federal nexus.

As discussed above, adherence to federal, state, and local regulations would be required. While adherence to regulations would reduce noise impacts, depending on the proximity to existing sensitive land uses, duration of construction activities, and types of equipment required, construction-related noise levels could exceed applicable construction-related noise standards and thresholds, and impacts could exceed levels of significance.

Extension of rail transit, as well as increases in transit frequency, could result in increased noise levels that exceed applicable local, state, or federal thresholds. Similar to construction noise, operations noise increases would be variable and dependent on the location of improvements relative to the land uses, the presence of shielding between the sources and receiver, and the existing ambient noise level from other nearby noise sources. In addition, the severity of new transit network improvement projects would depend upon the type (diesel or electric powered),frequency of rail pass-by events and the existing ambient noise level at the existing receptor. For example, a doubling of sound energy (e.g., doubling of passenger trains from double-tracking) would result in a 3 dBA increase in sound and would generally be perceived as barely detectable.

As discussed in Section 4.13.2, "Regulatory Setting," federal, state, and local agencies have established noise standards, developed requirements for evaluating noise impacts, and put forth guidance for developing measures to reduce noise impacts and protect public health. Transportation network projects with federal involvement or located on the state highway system would be required to comply with 23 CFR 772, which establishes standards for the analysis and abatement of highway traffic noise, and state (Caltrans) guidance, which outlines policies and procedures for applying 23 CFR 772 in California (Caltrans 2020b). In addition, federal or state requirements for noise reduction could be required dependent on the type of project and the presence of a federal action or nexus. Examples of noise abatement measures include the construction of noise barriers, which shield receptors from noise sources and traffic management measures (e.g., traffic control devices, time-use restrictions, speed limit modifications), which would reduce traffic noise by slowing vehicles down or limiting the use of specific roadways during sensitive hours (Caltrans 2020b). Although the exact noise reduction associated with implementation of such abatement measures would vary, in accordance with 23 CFR 772, for noise abatement to be considered acoustically feasible, it must provide at least a 5 dBA minimum reduction at an impacted receptor (Caltrans 2020b: 3-8). Therefore, adherence to federal or state requirements for noise abatement would result in at least a 5 dBA noise reduction. However, there could be instances where a 5 dBA reduction from implementation of abatement measures would not be sufficient to reduce noise to an acceptable level. Many local jurisdictions have established noise compatibility standards in their municipal codes or general plans which limit sensitive development within incompatible zones and establish noise standards to ensure that sensitive land uses are not exposed to excessive transportation noise levels. Compliance with these regulations would minimize the potential for adverse transportation noise impacts that could result from implementation of the proposed Plan. Although adherence to regulations would reduce noise impacts, noise impacts may not be reduced to below levels of significance.

2035 Conclusion

Between 2022 and 2035, regional growth and land use change and transportation network improvements could increase noise levels throughout the region, resulting in new or increased noise that exceed applicable standards or represent substantial increases in ambient noise levels. Therefore, this impact (NOI-1) in 2035 would be significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0, "Project Description," of this Draft EIR, from 2036 to 2050, the regional population is forecast to decrease by 4,112 people (-0.1%), while housing units are projected to increase by 65,577 (4.8%) and jobs by 103,460 (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions.

As described in the 2035 analysis, construction of new land use development could result in temporary noise levels that exceed applicable thresholds or result in a temporary substantial (e.g., 5+ dBA) increase in noise. According to the noise levels in Table 4.13-4, construction equipment noise levels would range from 70 (generator more than 25 kVA) to 94 dBA L_{eq} (impact pile driver) at 50 feet. As described above and shown in Table 4.13-13, most jurisdictions in the region establish a construction noise level limit of 75 dBA L_{eq}, and thus, this noise level is used to evaluate potential construction noise effects associated with land use growth. Noise levels associated with the operation of a bulldozer and impact pile driver would attenuate to 75 dBA L_{eq} within 71 feet and 446 feet, respectively (see Appendix L for detailed modeling inputs). The severity of construction noise effects would vary depending on the existing noise levels, proximity to sensitive uses, and presence of barriers that attenuate noise. As discussed in the 2035 analysis, adherence to applicable regulations (e.g., limited construction hours or operational standards) related to construction noise would be required. Although adherence to regulations would reduce noise impacts, depending on the proximity to existing sensitive land uses, duration of construction activities, and types of equipment required, construction-related noise levels could exceed applicable local construction-related noise standards and thresholds.

In addition to short-term construction noise, regional growth and land use change could result in new operations noise sources and increased operations noise levels. As discussed above in the 2035 analysis, the proposed Plan development pattern would result in new land uses that include stationary noise sources (e.g., HVAC equipment). While the exact magnitude of increased noise from the introduction of new land uses is speculative, certain locations, noise associated with new stationary noise sources could exceed an acceptable noise standard or result in a permanent increase in noise at nearby land uses. In addition, because of the anticipated growth within the region, an absolute increase in roadway traffic volumes is anticipated. Noise increases would be variable and depend upon the location of improvements relative to land uses, the presence of shielding between the sources and receiver, and the existing ambient noise level from other nearby noise sources. However, traffic noise associated with development in this time horizon could exceed an acceptable noise standard or result in a permanent substantial (e.g., 5+ dBA) increase in noise at nearby land uses.

Federal, state, and local regulations described in Section 4.13.2, "Regulatory Setting," reduce the potential for noise impacts during construction and operations of new land uses by establishing noise standards to limit excessive noise levels, limiting construction and operations activities during sensitive times of day (i.e., evening and nighttime), and requiring the implementation of measures, when necessary, to reduce adverse effects from increased noise. Adherence to applicable noise policies and procedures would be required during construction and operations. In addition, federal or state requirements for noise reduction may be required depending on the type of development and the presence of a federal action or nexus. Although adherence to applicable regulations would be required and would reduce temporary and long-term noise impacts associated with land use growth, construction and operations noise levels could exceed applicable thresholds, and ambient noise could substantially increase. Therefore, impacts of regional growth and land use change as they relate to noise would be significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period.

Similar to the 2035 analysis, construction and operations of transportation network improvements during the 2050 horizon year could result in new or increased noise at nearby land uses. The construction of transportation network improvements would require the use of heavy construction equipment (e.g., bulldozers, graders, backhoes) and high-impact equipment (e.g., pile drivers, rock drilling equipment). Noise levels associated with the operation of a bulldozer and impact pile driver would attenuate to 75 dBA L_{eq} within 71 feet and 446 feet, respectively (see Appendix L for detailed modeling inputs).

Transportation network improvement projects with federal involvement or located on the state highway system would be required to comply with the specific noise standards of the respective agency. Caltrans establishes a construction noise production limit of 86 dBA L_{max} at 50 feet from the jobsite. Noise levels associated with the operation of a bulldozer and impact pile driver would attenuate to 86 dBA L_{max} within 32 feet and 281 feet, respectively (see Appendix L for detailed modeling inputs). Thus, if construction of transportation network improvements were to occur within these distances of a sensitive receptor, construction could exceed Caltrans-recommended noise levels. In addition, according to the modeling conducted, construction-related noise levels could exceed FTA construction noise criteria, which limit the total noise increase based on existing noise levels. Projects that meet the definition of a Type I project (as defined in Section 4.13.1) would be subject to the requirements of 23 CFR 772, which outlines procedures for analyzing traffic and construction noise impacts on federal or federally funded highway projects. If a project associated with the proposed Plan met the definition, it would require additional noise analysis.

Similar to the 2035 analysis, transportation improvement projects could result in increased noise levels that exceed applicable local, state, or federal thresholds. Transportation network projects with federal involvement or located on the state highway system would be required to comply with federal (23 CFR 772) and state (Caltrans) guidance for analyzing noise impacts and developing noise abatement measures to reduce any adverse impacts to sensitive receptors. In addition, federal or state requirements for noise reduction could be required dependent on the type of project and the presence of a federal action or nexus. Examples of noise abatement measures include the construction of noise barriers, which shield receptors from noise sources, and traffic management measures (e.g., traffic control devices, time-use restrictions, speed limit modifications), which would reduce traffic noise by slowing vehicles down or limiting the use of specific roadways during sensitive hours (Caltrans 2020b). Although the exact noise reduction associated with implementation of such abatement measures would vary, in accordance with 23 CFR 772, for noise abatement to be considered acoustically feasible, it must provide at least a 5 dBA minimum reduction at an impacted receptor (Caltrans 2020b: 3-8). Therefore, adherence to federal or state requirements for noise abatement would result in at least a 5 dBA noise reduction. However, there could be instances where a 5 dBA reduction from implementation of abatement measures would not be sufficient to reduce noise to an acceptable level. Transportation improvement projects would be subject to applicable local, state, and federal regulations for assessing and abating transportation noise impacts. However, noise impacts from the implementation of all transportation improvement projects and programs could exceed levels of significance.

2050 Conclusion

Between 2036 and 2050, regional growth and land use change and transportation network improvements could increase noise levels throughout the region, resulting in new or increased noise impacts that exceed applicable standards or represent substantial increases in ambient noise levels. Therefore, this impact (NOI-1) is significant.

MITIGATION MEASURES

NOI-1 GENERATION OF A SUBSTANTIAL TEMPORARY OR PERMANENT INCREASE IN AMBIENT NOISE LEVELS IN THE VICINITY OF THE PROJECT IN EXCESS OF STANDARDS ESTABLISHED IN THE LOCAL GENERAL PLAN OR NOISE ORDINANCE, OR APPLICABLE STANDARDS OF OTHER AGENCIES; OR GENERATE A SUBSTANTIAL ABSOLUTE INCREASE IN AMBIENT NOISE.

2035, 2050

NOI-1a Implement Construction Noise Reduction Measures for Development Projects and Transportation Network Improvements.

During project-level CEQA review and during construction of development projects and transportation network improvements, local jurisdictions and transportation project sponsors can and should, and SANDAG shall, implement construction noise reduction measures to substantially lessen the exposure of noise-sensitive receptors to construction noise levels to achieve applicable noise standards or prevent substantial temporary increases in noise levels in the planning, design, project-level CEQA review, and construction of development projects or transportation network improvements. These measures should consist of, but are not limited to, the following.

- Maintain construction equipment and vehicles per manufacturers' specifications and fit equipment with noise-suppression devices (e.g., improved mufflers, equipment redesign, intake silencers, wraps, ducts, engine enclosures).
- Minimize construction equipment idling when equipment is not in use.
- Provide buffer zones or other techniques between stationary equipment (such as generators, compressors, rock crushers, and cement mixers) and the noise receptor.
- For impact tools (e.g., jack hammers, pavement breakers, rock drills), use hydraulically or electrically powered tools; where use of pneumatic tools is unavoidable, use an exhaust muffler on the compressed air exhaust. Use external jackets on the tools themselves. Use quieter procedures, such as drills rather than impact equipment.
- For rock-crushing or screening operations, place material stockpiles as a noise barrier blocking line-of sight between the operations and receptors.

In addition, to substantially lessen the exposure of noise-sensitive receptors to construction noise levels from pile driving or other activities generating noise levels greater than 90 dBA L_{eq} at 50 feet during construction of development projects or transportation network improvements, local jurisdictions and other transportation project sponsors can and should, and SANDAG shall, implement noise reduction measures to achieve applicable noise standards or prevent substantial increases in noise levels. These measures should consist of, but are not limited to, the following.

- Erect temporary noise barriers around the noise-generating activities, particularly adjacent to residential buildings. When installed properly, acoustic barriers can reduction construction noise levels by approximately 8 to 10 dBA (EPA 1971).
- Implement "quiet" pile-driving technology (such as predrilling of piles, the use of more than one pile driver to shorten the total pile-driving duration) or vibratory pile driving, where feasible, in consideration of geotechnical and structural requirements and conditions.
- Monitor the effectiveness of noise-attenuation measures by performing compliance noise monitoring at noise-sensitive receptors during construction.

NOI-1b Implement Operational Noise Reduction Measures for Transportation Network Improvements.
During the planning, design, and project-level CEQA review and construction of transportation network improvements, SANDAG shall, and other transportation project sponsors can and should, implement operations noise-reduction measures to substantially lessen the exposure of noise-sensitive receptors to noise levels to achieve applicable noise standards or prevent substantial permanent increases in noise levels. These measures should consist of, but are not limited to, the following.

- Utilize techniques such as grade separation, buffer zones, landscaped berms, sound walls, reduced-noise paving materials, building insulation, and traffic calming measures.

In addition, for railway projects, SANDAG shall, and other transportation project sponsors can and should, implement measures to substantially lessen noise levels to achieve FTA/FRA railway noise-exposure thresholds during planning, design, and project-level CEQA review. These measures should consist of, but are not limited to, the following.

- Use wheel treatments, such as damped wheels and resilient wheels.
- Use vehicle treatments, such as vehicle skirts and under car acoustically absorptive material.
- Establish sufficient buffer zones between railroad and receptors.
- Use sound-reduction barriers, such as landscaped berms.
- Install sound insulation treatments for impacted structures.
- Implement FRA "quiet zone" requirements in cooperation with local jurisdictions (i.e., reducing or eliminating the requirement for train locomotives to blast their horns) for Plan improvements at new and existing at-grade rail crossings.
- Conduct project-level noise analysis for new and expanded rail corridors and features such as new rail tracks and double-tracking to ensure that measures are implemented to substantially lessen noise levels that exceed applicable standards.

NOI-1c Implement Operational Noise Reduction Measures for Development Projects.
During planning, design, and project-level CEQA review of development projects, the County of San Diego, cities, and other local jurisdictions can and should implement noise reduction measures to meet local noise standards, consisting of, but not limited to, the following.

- Use land use measures, such as zoning, site design, and buffers, to ensure that future development is noise compatible with adjacent transportation facilities and land uses.
- Site noise-sensitive land uses away from noise-generating facilities. Once sited, orient outdoor use areas of land uses (e.g., backyards) away from adjacent noise sources to shield area with buildings, or construct noise barriers to reduce exterior noise levels.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Mitigation Measure NOI-1a would provide substantial reductions in construction noise levels by ensuring proper equipment use, locating equipment away from sensitive receptors, and requiring the use of enclosures and noise barriers. Implementation of these noise-reduction measures could reduce construction noise levels by up to approximately 10 dBA (NCHRP 1999; EPA 1971). Mitigation Measures NOI-1b and NOI-1c would reduce exposure of sensitive receptors to excessive transportation and stationary noise levels through site design and building construction, based on site-specific parameters, though the noise reduction would vary depending on the specific measure. For example, the implementation of vehicle skirts for rail projects under Mitigation Measure NOI-1b could result in a 6 to 10 dBA noise reduction (FTA 2018: 97) and shielding from intervening buildings under Mitigation Measure NOI-1c could reduce noise by up to 10 dBA (FTA 2018: 49). Mitigation measures NOI-1a, NOI-1b, and NOI-

1c would substantially reduce significant noise impacts caused by exceedances of noise standards. However, because project-specific information, such as the presence and proximity of sensitive receptors, are currently unknown, implementation of these measures does not guarantee that all future project-level impacts could be mitigated to a less than significant level. Therefore, this impact (NOI-1) would remain significant and unavoidable.

NOI-2 GENERATION OF EXCESSIVE GROUNDBORNE VIBRATION OR GROUNDBORNE NOISE LEVELS.

Analysis Methodology

This section discusses the construction and operations vibration impacts of forecasted regional growth and land use change and planned transportation network improvements in comparison to the applicable standards and guidelines. Construction activities could potentially expose nearby buildings to ground-vibration levels that result in structural damage or negative human response. Buildings containing vibration-sensitive uses (e.g., residential, research and development, institutional) could be exposed to disturbing vibration levels if located in proximity to major operations vibration sources (e.g., rail, bus transit centers).

Typical construction activities associated with the proposed Plan would include the use of bulldozers, graders, and loaded trucks. In addition, some construction activity could require the use of high-impact equipment (e.g., pile drivers, crack-and-seat breakers, vibratory rollers). Pile drivers are often used in the construction of bridges and multistory buildings and could be required depending on the soil type. Crack-and-seat operations are used to repair roadways and involve impact breaker equipment to crack the roadway and then heavy rollers to compact and install new overlays. Crack-and-seat operations and pile driving activities generate the highest vibration levels associated with construction equipment.

As shown in Table 4.13-14, several counties and cities within the region establish guidance related to operations vibration sources. However, few of the local jurisdictions (cities and county) provide quantitative vibration criteria; therefore, in this analysis, guidance and criteria from FTA and Caltrans were used. Specifically, to evaluate the effects of construction vibration, the Caltrans threshold of 0.04 in/sec PPV for distinctly perceptible vibration effects from continuous/frequent intermittent sources (Table 4.13-11) is used to evaluate human annoyance and the Caltrans thresholds of 0.1 in/sec PPV and 0.3 in/sec PPV for structural damage to fragile buildings and older residential structures, respectively, are used (Table 4.13-10). These two thresholds were selected to represent the types of buildings generally found throughout the plan area (i.e., fragile buildings, older buildings, older residential buildings, and newer residential and commercial buildings). Construction vibration contour distances for structural damage and human annoyance were modeled based on reference vibration levels for construction equipment that could be used and would generate the greatest levels of ground vibration and were based on methodologies and usage factors from the FTA's *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018). To evaluate the effects of operational vibration associated with transportation improvement projects, the FTA screening distances for vibration are used (Table 4.13-5).

FTA's screening distances (Table 4.13-5) for major vibration sources (e.g., rail, bus transit centers) were applied for evaluating the potential for exposure from these sources to sensitive land uses.

Vibration impacts (NOI-2) are considered significant if they exceed the criteria provided by FTA and Caltrans (as applicable, depending on the project type) for human disturbance or structural damage. Detailed quantitative analyses of potential impacts are not practical given the high-level (programmatic) nature of the proposed Plan and the lack of specific project details. For this reason, the analysis is largely qualitative, supplemented with published data or sample calculations, where possible, to illustrate the points discussed in the analysis.

Impact Analysis

2035

Regional Growth and Land Use Change

As identified in Table 2-1 in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted to increase by 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown on Figure 2-4. To accommodate regional growth by 2035, new development including new housing units, commercial areas, industrial centers, and civic uses would be developed.

Construction activities associated with additional development and redevelopment could include site preparation, excavation, grading, building construction, and other related construction activities. These types of construction activities require the use of heavy-duty construction equipment (e.g., backhoes, jackhammers) that typically generate significant amounts of vibration in the immediate vicinity (e.g., exceed the FTA threshold for structural damage to non-engineered timber and masonry buildings of 0.20 in/sec PPV [FTA 2018] within 15 feet) of the source.

Reference vibration levels are shown in Table 4.13-6 for various equipment types. According to these reference levels, crack-and-seat operations, used for repairing roadways, generate the highest levels of vibration.

Development projects may require the use of vibration-intensive construction equipment, such as crack-and-seat operations (which could be used for roadway repairs), pile drivers (which could be used for multistory development), and vibratory rollers (which could be used for foundation work or roadway construction). The effects of vibration generated by construction activities depend on several factors, including the duration and type of construction activities and the distance between source and receptor.

As shown in Table 4.13-6, of the construction equipment that would likely be used during land use development, pile driving generates the highest vibration levels (i.e., 0.65 in/sec PPV at 25 feet) and can be necessary in the construction of multistory buildings depending on the soil type and building structure. In addition, less-intensive impact equipment, such as a vibratory roller, could be used during construction activities. As detailed above under "Analysis Methodology," although some local jurisdictions have established operations vibration regulations, local quantitative vibration standards related to construction do not exist. Therefore, in this analysis, the Caltrans-recommended vibration thresholds for structural damage (i.e., 0.1 in/sec PPV for fragile buildings and 0.3 in/sec PPV for older residential structures) and human annoyance to continuous/frequent intermittent sources (i.e., 0.04 in/sec PPV) are used. According to FTA-recommended procedures for applying a propagation adjustment to these reference levels, vibration levels from impact pile driving could exceed the recommended level for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 88 feet of equipment operation and the recommended threshold for structural damage to older residential buildings (i.e., 0.30 in/sec PPV) within 42 feet (see Appendix L for detailed modeling inputs). Vibration levels from a vibratory roller could exceed the recommended level for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 42 feet of equipment operation and the recommended threshold for older residential buildings (i.e., 0.30 in/sec PPV) within 20 feet (see Appendix L for detailed modeling inputs). As shown in Table 4.13-6, an impact pile driver would exceed the threshold of 0.04 in/sec PPV for distinctly perceptible vibration effects from continuous/frequent intermittent sources within 316 feet, and a vibratory roller would exceed the threshold of 0.04 in/sec PPV for distinctly perceptible vibration effects from continuous/frequent intermittent sources within 113 feet of operation.

Because the proposed Plan promotes development in areas with access to public transit and other sustainable transportation choices, (including ones that exist now and in the future), most projected development would likely occur in developed areas; thus, the likelihood exists for impact pile driving to occur within 88 feet of a fragile building and within 42 feet of older residential buildings, potentially posing structural damage issues. In addition, the likelihood exists for impact pile driving and other intensive construction activities (e.g., vibratory rolling) to occur within 316 feet of an existing vibration-sensitive land use. Therefore, construction of development projects associated with regional growth and land use change under the proposed Plan could exceed recommended vibration thresholds for structural damage and adverse human response.

New development, such as residential, commercial, and civic land uses, generally do not produce noticeable levels of vibration; operational vibration from these land uses is generally associated with vehicles such as trucks accessing local roadway networks which rarely produce a cumulative increase in ground vibration (Caltrans 2020b). These sources generally do not produce noticeable levels of vibration and thus are not expected to exceed applicable thresholds for structural damage or adverse human response. In addition, new development associated with the proposed Plan would occur in accordance with adopted land use plans and zoning ordinances of the cities and counties in the Plan area, which typically prohibit vibration-intensive land use (e.g., industrial) within incompatible (e.g., residential) zones. Because vibration decreases rapidly with distance (Caltrans 2020b), separating vibration-intensive land uses from sensitive land uses (e.g., residential) can minimize annoyance-related vibration impacts. For these reasons, operations vibration associated with regional growth and land use change is not expected to create a significant vibration impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

Construction of transportation network improvements under the proposed Plan could result in temporary increases in vibration associated with the use of vibration-intensive equipment. As shown in Table 4.13-6, of the construction equipment that would likely be used during transportation network improvements, crack-and-seat operations generate the highest vibration levels (i.e., 2.40 in/sec PPV at 25 feet). Crack-and-seat operations can be necessary for roadway repairs and thus are of greatest concern when evaluating construction-related vibration impacts associated with implementation of the proposed Plan. Pile driving generates the second highest vibration levels (i.e., 0.65 in/sec PPV at 25 feet) and can be necessary in the construction or repair of bridges and roadways. In addition, less-intensive impact equipment such as a vibratory roller could be used during construction activities. Construction-related vibration impacts from transportation project implementation would be similar to those described above for land use change. Crack-and-seat operations could exceed the recommended thresholds for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 210 feet of equipment operation and the recommended threshold for structural damage to older residences (i.e., 0.30 in/sec PPV) within 100 feet (see Appendix L for detailed modeling inputs). In addition, crack-and-seat operations, an impact pile driver, and a vibratory roller would exceed the threshold of 0.04 in/sec PPV for distinctly perceptible vibration effects from continuous/frequent intermittent sources within 1,034 feet, 316 feet, and 113 feet of operation, respectively (Table 4.13-6). Because most projected transportation network improvement projects would occur in developed areas, the likelihood exists for crack-and-seat operations to occur within 210 feet of a fragile building and within 100 feet of older residential buildings. In addition, the likelihood exists for crack-and-seat operations and other intensive construction activities (i.e., impact pile driving and vibratory rolling) to occur within 1,034 feet, 316 feet, and 113 feet, respectively, of an existing land use, and therefore could result in human annoyance.

Transportation projects (e.g., roadway expansion) typically progress in a linear fashion (i.e., along the right-of-way); thus, construction activities could affect individual receptors for shorter periods of time as elevated vibration levels would occur only temporarily in the location where the construction occurs before moving along the right-of-way. However, transportation network improvement projects are sometimes required to occur during the night to minimize traffic congestion during peak travel periods and therefore, could result in greater disturbance (e.g., sleep disruption) to nearby sensitive receptors if construction were to occur during evening and nighttime hours. For these reasons, construction of transportation improvement projects associated with the proposed Plan could exceed recommended vibration thresholds for structural damage and adverse human response.

Transportation network improvements under the proposed Plan include new Managed Lanes and Managed Lane connectors, double-tracking at certain locations on the LOSSAN Rail Corridor along with increases in COASTER frequencies, and new *Rapid* bus routes. These improvements could result in exposure of nearby land uses to new or increased levels of vibration. In addition, groundborne vibration associated with construction and operation of improvement projects in proximity to coastal bluffs could result in adverse impacts if vibration from construction equipment or transportation are significant enough to contribute to erosion. However, vibration levels and the degree of impacts would vary greatly depending on the type of transit facility, geologic factors such as soil type, and proximity to existing sensitive land uses (FTA 2018). For example, the geologic profile of San Diego County's coastline ranges from low bluffs or cliffs cut into uplifted marine terraces typically consisting of erosion-prone Tertiary sedimentary rocks, to high relief, steep-cliffed outcrops and headlands such as Point Loma that typically consist of older, harder and more erosion-resistant rock types (National Research Council 1999.) The likelihood of vibration from Project improvements adversely impacting coastal bluffs would vary based on location-specific factors affecting efficiency of vibration propagation, such as soil stiffness and internal damping (FTA 2018). FTA's *Transit Noise and Vibration Impact Assessment Manual* includes a screening distance tool that identifies distances to different land uses at which vibration would generally attenuate to below impact levels. According to the screening distances shown in Table 4.13-5, residential land uses within 200 feet of rail rapid transit, within 150 feet of light rail transit, or within 50 feet of bus projects would be exposed to vibration exceeding the recommended thresholds for human annoyance and structural damage. Transportation improvement projects associated with the proposed Plan that are located outside the screening distances would likely not generate vibration levels that exceed applicable thresholds for structural damage or adverse human response at nearby land uses. However, because the proposed Plan emphasizes compact development within developed communities, some improvement projects could be located close to vibration-sensitive land uses, including coastal bluffs. Transportation improvement projects would be required to adhere to local, state, and federal requirements, which typically prohibit vibration-intensive projects within incompatible (e.g., residential) zones. However, vibration impacts from the implementation of all transportation improvement projects and programs could exceed levels of significance for structural damage and adverse human response.

2035 Conclusion

Improvements associated with regional growth and land use changes and transportation network improvements could generate substantial increases in ground vibration or groundborne noise levels during construction and operations. Although adherence to local, state, and federal regulations and standards which typically prohibit vibration-intensive projects within incompatible zones would be required, vibration impacts associated with the proposed Plan could exceed applicable thresholds and thus be excessive. Therefore, this impact (NOI-2) in 2035 would be significant.

2050

Regional Growth and Land Use Change

As identified in Table 2-1 in Section 2.0, "Project Description," of this Draft EIR, from 2036 to 2050, the regional population is forecast to decrease by 4,112 people (-0.1%), while housing units are projected to increase by 65,577 (4.8%) and jobs by 103,460 (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. To accommodate regional growth by 2050, new development would include new housing units, services, commercial areas, industrial centers, schools, and civic facilities.

As described in the 2035 analysis, construction of new land use developments could result in temporary vibration impacts that exceed applicable thresholds. According to the vibration levels in Table 4.13-6, of the construction equipment that would likely be used during land use development, impact pile driving generates the highest vibration levels (i.e., 0.65 in/sec PPV at 25 feet). According to FTA-recommended procedures for applying a

propagation adjustment to these reference levels, vibration levels from an impact pile driver could exceed the recommended level for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 88 feet of equipment operation and the recommended threshold for older residential buildings (i.e., 0.30 in/sec PPV) within 42 feet (see Appendix L for detailed modeling inputs). Vibration levels from a vibratory roller could exceed the recommended level for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 42 feet of equipment operation and the recommended threshold for older residential buildings (i.e., 0.30 in/sec PPV) within 20 feet (see Appendix L for detailed modeling inputs). As shown in Table 4.13-6, vibration from an impact pile driver and a vibratory roller would exceed the threshold of 0.04 in/sec PPV for distinctly perceptible vibration effects from continuous/frequent intermittent sources within 316 feet and 113 feet of operation, respectively.

By 2050, areas throughout the region would likely be more developed, thus increasing the likelihood for construction activities to occur near sensitive receptors as compared to 2035. Specifically, because the proposed Plan promotes more development in areas with access to public transit and other sustainable transportation choices, the likelihood exists for impact pile driving to occur within 88 feet of a fragile building and within 42 feet of older residential buildings. In addition, the likelihood exists for impact pile driving and other intensive construction activities (e.g., vibratory rolling) to occur within 316 feet and 113 feet, respectively, of an existing land use. Therefore, construction of development projects associated with regional growth and land use change under the proposed Plan could exceed recommended vibration thresholds for structural damage and adverse human response.

New development, such as residential, commercial, and civic land uses, generally do not produce noticeable levels of vibration; operations vibration from these land uses is generally associated with vehicles such as trucks accessing local roadway networks which rarely produce a cumulative increase in ground vibration (Caltrans 2020b). These sources generally do not produce noticeable levels of vibration and thus are not expected to exceed applicable thresholds for structural damage or adverse human response. In addition, new development associated with the proposed Plan would occur in accordance with adopted land use plans and zoning ordinances of the cities and counties in the Plan area, which typically prohibit vibration-intensive projects within incompatible (e.g., residential) zones. Because vibration decreases rapidly with distance (Caltrans 2020b), separating vibration-intensive land uses from sensitive land uses (e.g., residential) can minimize annoyance-related vibration impacts. For these reasons, operational vibration associated with regional growth and land use change is not expected to create a significant vibration impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

By 2050, areas throughout the region would likely be more developed (e.g., there would be more housing units as compared to 2035), thus increasing the likelihood for construction activities to occur near sensitive receptors as compared to 2035. Similar to the 2035 analysis, construction and operations of transportation network improvements during the 2050 horizon year could result in new or increased vibration levels at nearby land uses. The construction of transportation network improvements would require the use of heavy construction equipment (e.g., bulldozers, graders, backhoes) and high-impact equipment (e.g., crack-and-seat operations, pile drivers, rock drilling). As shown in Table 4.13-6, of the construction equipment that would likely be used during transportation network improvements, crack-and-seat operations generate the highest vibration levels (i.e., 2.40 in/sec PPV at 25 feet). Crack-and-seat operations can be necessary for roadway repairs and thus are of greatest concern when evaluating construction-related vibration impacts associated with implementation of the proposed Plan. Pile driving generates the second highest vibration levels (i.e., 0.65 in/sec PPV at 25 feet) and can be necessary in the construction or repair of bridges and roadways. In addition, less-intensive impact equipment such as a vibratory

roller could be used during construction activities. Construction-related vibration impacts from transportation project implementation would be similar to those described above for land use change. Crack-and-seat operations could exceed the recommended thresholds for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 210 feet of equipment operation and the recommended threshold for structural damage to older residences (i.e., 0.30 in/sec PPV) within 100 feet (see Appendix L for detailed modeling inputs). Vibration levels from an impact pile driver could exceed the recommended level for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 88 feet of equipment operation and the recommended threshold for older residential buildings (i.e., 0.30 in/sec PPV) within 42 feet (see Appendix L for detailed modeling inputs). Vibration levels from a vibratory roller could exceed the recommended level for structural damage to fragile buildings (i.e., 0.10 in/sec PPV) within 42 feet of equipment operation and the recommended threshold for older residential buildings (i.e., 0.30 in/sec PPV) within 20 feet (see Appendix L for detailed modeling inputs). In addition, as shown in Table 4.13-6, crack-and-seat operations would exceed the threshold of 0.04 in/sec PPV for distinctly perceptible vibration effects from continuous/frequent intermittent sources within 1,034 feet; and an impact pile driver and a vibratory roller would exceed the threshold of 0.04 in/sec PPV for distinctly perceptible vibration effects from continuous/frequent intermittent sources within 316 feet and 113 feet of operation, respectively.

Because most projected transportation network improvement projects would occur in developed areas, the likelihood exists for crack-and-seat operations to occur within 210 feet of a fragile building and within 100 feet of older residential buildings. In addition, the likelihood exists for pile driving and other intensive construction activities (i.e., impact pile driving and vibratory rolling) to occur within 1,034 feet, 316 feet, and 113 feet, respectively, of an existing land use. Therefore, construction of transportation improvement projects associated with the proposed Plan could exceed recommended vibration thresholds for structural damage and adverse human response.

Transportation network improvements under the proposed Plan could result in exposure of nearby land uses to new or increased levels of vibration. In addition, vibration associated with improvement projects in proximity to coastal bluffs could result in adverse impacts, as discussed above. However, vibration levels would vary greatly depending on the type of transit facility and proximity to existing sensitive land uses. As detailed above, FTA establishes screening distances to evaluate impacts from transportation vibration. According to the screening distances shown in Table 4.13-5, residential land uses within 200 feet of rail rapid transit, within 150 feet of light rail transit, or within 50 feet of bus projects would be exposed to vibration exceeding the recommended thresholds for human annoyance and structural damage. Transportation improvement projects associated with the proposed Plan that are located outside the screening distances would likely not generate vibration levels that exceed applicable thresholds for structural damage or adverse human response at nearby land uses. However, because the proposed Plan emphasizes compact development within developed communities, some improvement projects could be located close to vibration-sensitive land uses, including coastal bluffs. Transportation improvement projects would be required to adhere to local, state, and federal requirements, which typically prohibit vibration-intensive projects within incompatible (e.g., residential) zones. However, vibration impacts from the implementation of all transportation improvement projects and programs could exceed levels of significance for structural damage and adverse human response.

2050 Conclusion

Regional growth, land use development, and transportation network improvements would increase by 2050. Improvements associated with regional growth and land use changes and transportation network improvements could generate substantial increases in ground vibration or groundborne noise levels during construction and operation. Although adherence to local, state, and federal regulations and standards which typically prohibit vibration-intensive projects within incompatible zones, would be required, vibration impacts associated with the proposed Plan could exceed applicable thresholds and thus be excessive. Therefore, this impact (NOI-2) in 2050 would be significant.

MITIGATION MEASURES

NOI-2 GENERATION OF EXCESSIVE GROUNDBORNE VIBRATION OR GROUNDBORNE NOISE LEVELS.

2035, 2050

NOI-2a Implement Construction Groundborne Vibration and Noise Reduction Measures.
SANDAG shall, and other public agencies and transportation project sponsors can and should, implement measures during design, project-level CEQA review, and construction of transportation network improvements and development projects, to reduce groundborne vibration and noise levels generated by on site construction equipment consisting of, but not limited to, the following:

- Where feasible, use soil mix wall for excavation.
- Incorporate a comprehensive construction vibration specification into all construction bid documents.
- Require a contractor to assess the potential for damage to buildings within 88 feet of areas where excavation requires the use of driven piles either by impact or vibratory methods.
- To prevent structural damage, minimum setback requirements for different types of ground vibration-producing activities (e.g., pile driving) for the purpose of preventing damage to nearby structures shall be established based on the proposed activities and locations, once determined. Factors to be considered shall include the specific nature of the vibration-producing activity (e.g., type and duration of pile driving), the proximity of existing structures, and the fragility/resiliency of nearby structures. Established setback requirements can be breached if a project-specific, site-specific vibration analysis is conducted by a qualified geotechnical engineer or ground vibration specialist that indicates that no structural damage would occur at nearby buildings or structures.
- If crack-and-seat operations, pile driving, or other vibration-generating construction activities are to occur within 210 feet of a fragile building (e.g., based on building/structural category under Caltrans Guideline Vibration Damage Potential Threshold Criteria [Caltrans Transportation and Construction Vibration Guidance Manual, Table 19]) that would likely be damaged by exceeding the applicable vibration threshold, implement measures to reduce vibration, consisting of, but not limited to, the following:
  - Retain a structural engineer or other appropriate professional to determine threshold levels of vibration and cracking that would damage any fragile structure, and design construction methods to not exceed the thresholds.
  - Require groundborne-vibration monitoring of nearby fragile structures. Implement a monitoring program to detect ground settlement or lateral movement of structures in the vicinity of pile-driving activities and identify corrective measures to be taken should monitored vibration levels indicate the potential for vibration damage to historic structures.
- To prevent disturbance to sensitive land uses associated with construction activity within the impact distances shown in Table NOI-2a below, the following measures shall be implemented:
  - Alternatives to impact pile driving (e.g., sonic pile driving, jetting, cast-in-place or auger cast piles) shall be considered and implemented where feasible to reduce vibration levels.
  - Phase pile driving and other high-impact activities (i.e., equipment or activity with a reference PPV of 0.20 in/sec at 25 feet or higher, the FTA threshold for structural damage to non-engineered timber and masonry buildings) so as not to occur simultaneously with other construction activities, to the extent feasible, to reduce total vibration from construction sources.
  - Construction operations that include high-impact activities (i.e., the use of equipment or activity with a reference PPV of 0.20 in/sec at 25 feet or higher) shall be limited to daytime hours, with daylight hours being defined by the applicable jurisdiction or agency.

Table NOI-2a Construction Equipment Vibration Levels and Impact Distances[1]

Equipment Item	Reference PPV (in/sec) at 25 feet	Distance to Human Response (feet), Distinctly Perceptible Threshold[2]
Crack-and-seat operations	2.4	1,034
Impact pile driver	0.65	316
Vibratory pile driver	0.65	316
Hydraulic breaker	0.24	128
Vibratory roller	0.21	113
Large bulldozer	0.089	52
Caisson drilling	0.089	52
Jackhammer	0.035	23
Small bulldozer	0.003	3

Notes: PPV = peak particle velocity; in/sec = inches per second.

[1] Distances are calculated using the Reference PPV (PPV_{ref}) at 25 feet. The equation used to calculate these distances is $PPV = PPV_{ref} * (25/D)^n$ (Caltrans 2020a).

[2] Caltrans threshold of 0.04 in/sec PPV applied as distinctly perceptible threshold.

Sources: Caltrans 2020a; FTA 2018.

NOI-2b Implement Groundborne-Vibration and Noise Reduction Measures for Rail Operations.
SANDAG shall, and other transportation project sponsors can and should, implement vibration-reducing measures to meet FTA vibration guidelines (FTA 2018) during the planning, design, project-level CEQA review, construction, and operation of rail projects, consisting of, but not limited to, providing special track support systems, such as floating slabs, resiliently supported ties, high-resilience fasteners, and ballast mats.

In addition, rail operators can and should implement groundborne-vibration and noise-reducing measures to meet FTA vibration guidelines (FTA 2018) during the planning, design, project-level CEQA review, construction, and operation of rail projects, consisting of, but not limited to, the following:

- Conduct rail grinding on a regular basis to keep tracks smooth.
- Conduct wheel truing to recontour wheels to provide a smooth running surface and removing wheel flats.
- To reduce groundborne noise, achieve vibration isolation of the track from underlying surface using the following:
  - highly resilient direct fixation fasteners
  - tail suspended fastener system
  - isolated slab track system
  - floating slab track system

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of Mitigation Measure NOI-2a would reduce construction vibration impacts by ensuring proper actions (e.g., setbacks, vibration monitoring, limiting construction hours) are taken to prevent structural damage to nearby buildings and to minimize disturbance to sensitive uses. Mitigation Measure NOI-2b would require the implementation of vibration-reduction measures, such as providing special track support systems and ballast mats, to ensure transportation projects meet FTA vibration guidelines. Mitigation measures NOI-2a and NOI-2b would substantially reduce significant vibration impacts caused by exceedances of groundborne vibration criteria.

However, all future project-level impacts may not be mitigated to a less-than-significant level by NOI-2a and 2b. Therefore, this impact (NOI-2) would remain significant and unavoidable.

NOI-3 FOR A PROJECT LOCATED WITHIN THE VICINITY OF A PRIVATE AIRSTRIP OR AN AIRPORT LAND USE PLAN OR, WHERE SUCH A PLAN HAS NOT BEEN ADOPTED, WITHIN TWO MILES OF A PUBLIC AIRPORT OR PUBLIC-USE AIRPORT, THE PROJECT WOULD EXPOSE PEOPLE RESIDING OR WORKING IN THE PROJECT AREA TO EXCESSIVE NOISE LEVELS.

Analysis Methodology

This section discusses the potential noise impacts of locating land development and transportation improvements of the proposed Plan in proximity to public-use and military airports or private airstrips and helipads in the San Diego region. The locations of forecasted regional growth and land use change, as well as planned transportation improvements associated with the proposed Plan, are analyzed to determine whether people residing by or working near public-use airports and military airfields, or private airstrips and helipads, would be exposed to excessive noise levels from aircraft noise. "Excessive" is defined as exceeding land use compatibility noise level limits in ALUCPs or AICUZ studies for public-use and military airports and in FAA and Caltrans Aeronautics Division regulations and permitting for private airstrips or helipads. For example, based on FAA guidelines, residential land uses within the existing 65 CNEL or greater noise contours are not compatible with the aircraft noise exposure unless the residence has sound attenuation features that reduce interior noise to requisite levels (SDCRAA 2022b).

Detailed quantitative analysis of potential impacts is not practical given the high-level (programmatic) nature of the proposed Plan and the lack of specific project details. For this reason, the analysis is largely qualitative and is supplemented with published data or simple calculations where possible to illustrate the points discussed in the analysis.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (3.6%), 137,242 housing units (11.1%), and 67,297 jobs (4.2%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. To accommodate regional growth by 2035, new development would include new housing units, services, commercial areas, industrial centers, schools, and civic facilities.

As indicated in Section 4.13.1, "Existing Conditions," there are 16 public-use and military airports in the San Diego region. The regional growth plans would not result in operations changes to flight plans, ALUCPs, or AICUZs. However, regional growth could result in noise-sensitive (generally residential) land uses being developed along the flight paths of some of the regional airports or within ALUCP or AICUZ traffic zones. Because the locations of new development are unknown, if new development were to occur in areas close to other public or military airports or in flight, people residing or working in the area could be exposed to excessive noise levels.

To prevent incompatible uses in areas with higher aircraft noise, ALUCPs and AICUZs establish land use policies and criteria (e.g., noise compatibility zones) to limit future incompatible uses in certain areas to minimize noise impacts to people living and working within the ALUCP or AICUZ. In addition, many local jurisdictions' general plans include land use compatibility guidelines that designate acceptable levels of noise based on the type of development. As described in Sections 4.13.1 and 4.13.2, SDCRAA, the ALUC for the San Diego region, is required

to assist local agencies in ensuring compatible land uses in the vicinity of existing or proposed airports; to coordinate planning at state, regional, and local levels; to review plans or regulations submitted by local agencies; and to review and make recommendations regarding the land uses (SDIA 2025). The ALUC would identify the land use compatibility standards that apply to the project and determine whether the project is compatible, incompatible subject to specific conditions, or incompatible.

For airstrips, separation between developed land uses and the facilities would be identified in project-level planning or CEQA review. Separation between private airports and development is identified in accordance with FAA standards. Compliance with local jurisdiction general plans and FAA standards would reduce noise from airstrips and ensure land use compatibility. Regional growth and land use change could result in new developments close to public, private, or military airports. However, new development would be required to comply with existing regulations, including land use compatibility policies established in ALUCPs and AICUZs. Compliance with such standards would ensure that people working at or living in new developments would not be exposed to excessive noise from public or military airfields or private airstrips. Therefore, impacts would be less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

Transportation network improvements would include arterial improvements, development of circulator routes, highway intersection improvements, and multimodal corridor improvements. The transportation network improvement projects could potentially be located within areas close to existing airports or airstrips; however, they would not consist of habitable structures and are not considered noise-sensitive development. Therefore, no sensitive receptors would be exposed to excessive noise levels generated by nearby aircraft, and this impact would be less than significant.

2035 Conclusion

By 2035, increased development would occur near public, private, or military airports. To prevent incompatible uses in areas with higher aircraft noise, ALUCPs and AICUZs establish land use policies and criteria (e.g., noise compatibility zones) to limit future incompatible uses in certain areas to minimize noise impacts to people living and working within the ALUCP or AICUZ. Adherence to the regulations and land use compatibility standards within ALUCPs and AICUZs would ensure that residents and workers occupying noise-sensitive land uses are not exposed to noise levels that exceed applicable standards. Therefore, this impact (NOI-3) in the year 2035 would be less than significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. As described in the 2035 analysis, a portion of this growth would occur near public-use or military airports, particularly those located near existing urban development. ALUCPs and AICUZs establish land use policies and criteria (e.g., noise compatibility zones)

that discourage incompatible uses in certain areas to minimize noise impacts on people living and working within the ALUCP or AICUZ. In addition, many local jurisdictions' general plans include land use compatibility guidelines that designate acceptable levels of noise based on the type of development. Adherence to these regulations and programs would ensure that people working at or living in new developments would not be exposed to excessive noise from public or military airfields, or private airstrips. Therefore, impacts would be less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to the 2035 analysis, the transportation network improvement projects implemented during this time horizon could potentially be located in areas close to existing airports or airstrips; however, they would not consist of habitable structures and are not considered noise-sensitive development. Therefore, no sensitive receptors would be exposed to excessive noise levels generated by nearby aircraft, and this impact would be less than significant.

2050 Conclusion

By 2050, increased development would occur near public, private, or military airports. To prevent incompatible uses in areas with higher aircraft noise, ALUCPs and AICUZs establish land use policies and criteria (e.g., noise compatibility zones) to limit future incompatible uses in certain areas to minimize noise impacts to people living and working within the ALUCP or AICUZ. Adherence to regulations and land use compatibility standards within ALUCPs and AICUZs would ensure that residents and workers occupying noise-sensitive land uses are not exposed to noise levels that exceed applicable standards. Therefore, this impact (NOI-3) is less than significant for this period.

MITIGATION MEASURES

No mitigation measures are required for this impact.

4.13.5 Cumulative Impacts Analysis

C-NOI-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO NOISE AND VIBRATION

This section discusses the cumulative effects of past, present, and reasonably foreseeable future projects and the contribution of regional growth and land use change and transportation network improvements and programs included in the proposed Plan to these effects. The geographic scope for the cumulative noise and vibration analysis is the Southern California and Northern Baja California region. Transportation networks, including the regional roadway/interstate networks, rail lines, and airports, are prominent sources of environmental noise in the region. Development, growth, population increase, and land use change can contribute to an increase in ambient noise and vibration directly related to the type of development, increased use of transportation facilities, and the general introduction of new sources of noise and vibration.

Generally, the geographic scope of the cumulative impact analysis for noise and vibration is limited to the area immediately surrounding the project site. However, increases in ambient noise and vibration can occur on regional roadway and interstate networks, rail lines, and airports as a result of growth, population increase, or land use change. Thus, consideration of the Southern California and Northern Baja California region is appropriate.

This cumulative impact assessment considers and relies on the impact analysis within this EIR for the proposed Plan; the EIR for Connect SoCal 2024, the current RTP/SCS for the SCAG region (SCAG 2024); and the EIR for the

2019 SDIA Development Plan (SDCRAA 2019). Other plans with applicable information but no associated environmental analysis include the California-Baja California Border Master Plan (SANDAG 2021).

Impacts of the Proposed Plan

Regional growth and land use change and the transportation network improvements associated with the proposed Plan would generate construction and operations noise levels that would expose noise-sensitive receptors (e.g., residences, churches, hospitals) to noise levels that exceed applicable noise standards. In addition, construction and operations of projects associated with the proposed Plan could result in substantial increases in ambient noise levels. This exposure of people to, or generation of, noise levels exceeding applicable noise standards established by local jurisdictions or other agencies is considered a significant and unavoidable impact in horizon years 2035 and 2050 (Impact NOI-1).

Regional growth land use change and transportation network improvements under the proposed Plan in horizon years 2035 and 2050 would also result in conditions where construction of new development and transportation network improvements could also expose vibration-sensitive receptors (e.g., residences, churches, hospitals) to vibration levels that exceed applicable standards. This exposure of people to, or generation of, vibration levels exceeding applicable noise standards established in state and federal guidance is considered a significant and unavoidable impact in horizon years 2035 and 2050 (Impact NOI-2).

Future development under the proposed Plan would likely occur near public-use or military airports and private airstrips or helipads; however, compliance with existing aviation regulations, procedures, and ALUCPs and AICUZ policies would ensure project compatibility with public-use or military airports and private airstrips or helipads. Therefore, the impact of exposing people to excessive aviation noise would be less than significant in 2035 and 2050 (Impact NOI-3).

Due to the distribution characteristics of sound and vibration, construction and operational noise and vibration are generally limited to the vicinity of individual project sites. As discussed in this section, the effects of noise and vibration associated with implementation of the proposed Plan would vary depending on project- and site-specific conditions. When required, mitigation measures would reduce the noise and vibration impacts associated with projects under the proposed Plan. However, because it cannot be assured that applicable noise standards would be met, implementation of the proposed Plan would result in a substantial increase in noise and vibration within the region and thus would result in considerable contribution to a cumulatively significant impact.

Impacts of Related Projects

Other related regional transportation improvement projects, such as the California High-Speed Rail project, could have localized construction and operational noise impacts along the project alignment. Land development projects throughout the region would also generate localized construction and operations noise impacts. All regional projects would be required to adhere to existing regulations discussed in Section 4.13.2, "Regulatory Setting," and to implement mitigation measures if noise and vibration levels exceed applicable thresholds. However, if these projects were to occur in close proximity to one another and within the same time frame, they could combine to create cumulative impacts.

Impacts of Projections in Adopted Plans

The SCAG Connect SoCal 2024 Program EIR found that implementation of Connect SoCal 2024 could result in exposure of persons to, or generation of, noise levels in excess of applicable noise standards established in general plans, noise ordinances, or applicable standards of other agencies. Thus, Connect SoCal 2024 would contribute to substantial noise impacts in the region. The SCAG Connect SoCal 2024 Program EIR also determined that Connect SoCal 2024 could result in the exposure of people to excessive vibration and groundborne noise levels. Thus, SCAG Connect SoCal 2024 would contribute to significant vibration impacts in the region. Finally, the SCAG Connect SoCal 2024 Program EIR determined that Connect SoCal 2024 had the potential to expose people to excessive aviation-related noise (SCAG 2024).

The 2019 SDIA Development Plan EIR considered potential aviation, surface transportation, construction, and cumulative noise impacts associated with the Airport Development Plan and its alternatives. The EIR found that the Airport Development Plan's cumulative noise impact would be cumulatively considerable in combination with operational aircraft and roadway noise exposure levels. Construction noise changes due to the Airport Development Plan were found to be less than significant (SDCRAA 2019).

The California-Baja California Border Master Plan is a binational comprehensive approach to coordinate planning and delivery of projects at land ports of entry and transportation infrastructure serving those ports of entry in the California-Baja California region (SANDAG 2021). The Master Plan does not have an associated environmental analysis document; however, it is reasonable to assume that projects included in the Master Plan could have adverse impacts related to noise and vibration levels that exceed applicable thresholds or result in a substantial increase above existing ambient levels as result of the expansion of existing transportation facilities and the development of new transportation facilities.

Cumulative Impacts and Impact Conclusions

2035

A significant cumulative impact in 2035 would result if the combined impacts of the proposed Plan, impacts of cumulative projects, and impacts of projections from adopted plans within the Southern California and Northern Baja California region were significant when considered together, even if not independently significant. As described above, future development and transportation network improvements associated with the proposed Plan would cause exceedances of noise standards and result in the exposure of sensitive receptors to substantial short-term and permanent noise increases. Future development and transportation network improvements associated with the proposed Plan would also cause vibration impacts that could exceed applicable thresholds and thus be excessive.

Significant noise and vibration impacts have been identified in other environmental analysis documents for cumulative projects and adopted plans. The combination of the direct noise and vibration impacts from the proposed Plan and other cumulative projects adopted plans that would affect the San Diego and Northern Baja California region would, therefore, result in significant cumulative noise and vibration impacts based on exposure to, or generation of, noise levels that exceed applicable standards, substantial temporary and permanent increases in noise levels, and excessive vibration and groundborne noise. Because the proposed Plan's noise and vibration impacts are significant, the proposed Plan would contribute to cumulatively considerable noise and vibration impact in 2035 (Impact C-NOI-1).

As described above, future development and transportation network improvements forecasted in the proposed Plan would occur near public airports and private airstrips, but residents and workers would not be exposed to excessive noise levels. As discussed above, while the 2019 SDIA Development Plan EIR identified a cumulative aircraft-induced noise exposure due to the Airport Development Plan (SDCRAA 2019), the proposed Plan's impacts related to aircraft noise would continue be less than significant because residents and workers would continue not be exposed to excessive noise levels. Therefore, cumulative aircraft noise exposure impacts would not be significant, and the proposed Plan would not result in a cumulatively considerable contribution to aircraft noise exposure.

2050

The cumulative analyses presented above for the horizon year 2035 would be applicable to 2050. Because cumulative noise and vibration impacts throughout the San Diego and Northern Baja California region would be significant by 2050 and because the proposed Plan's noise and vibration impacts are significant, the proposed Plan would contribute to a cumulatively considerable noise and vibration impact in 2050 (Impact C-NOI-1). As described for 2035, the proposed Plan would not result in a cumulatively considerable contribution to aircraft noise exposure.

MITIGATION MEASURES

C-NOI-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO NOISE AND VIBRATION

Mitigation Measure NOI-1a calls for construction noise reduction measures to meet local standards and reduce temporary noise levels during construction, and Mitigation Measures NOI-1b and NOI-1c call for operations noise-reduction measures to be implemented to meet local standards and reduce permanent noise levels during operations for transportation network improvements and development projects, respectively. As discussed previously, mitigation measures would reduce noise impacts but would not guarantee reduction of all projects associated with the proposed Plan to below applicable levels of significance. Therefore, the proposed Plan's contributions to cumulative noise impacts in 2035 and 2050 would remain cumulatively considerable with mitigation.

Mitigation Measure NOI-2a calls for groundborne vibration-reduction and groundborne noise-reduction measures to be implemented during construction activities, and Mitigation Measure NOI-2b requires groundborne vibration- reduction and groundborne noise-reduction measures for operations. As discussed above, mitigation measures would reduce significant increases in vibration and groundborne noise for some projects; however, they would not guarantee that vibration associated with all future projects would be reduced to a less-than-significant level. Therefore, the proposed Plan's contributions to cumulative vibration and groundborne noise in 2035 and 2050 would remain cumulatively considerable with mitigation.

2035, 2050

For the reasons discussed above, the proposed Project's contribution to cumulative noise and vibration impacts in 2035 and 2050 would remain cumulatively considerable with mitigation.

4.14 POPULATION AND HOUSING

This section evaluates the potential population and housing impacts of the proposed Plan.

4.14.1 Existing Conditions

The following discussion describes the existing population, housing units, and jobs in the San Diego region and describes SANDAG's growth forecasting process.

EXISTING POPULATION, HOUSING UNITS, AND EMPLOYMENT

Table 4.14-1 details the existing regional population, housing units, and jobs for the 18 incorporated cities and unincorporated county.

Table 4.14-1 Existing Population, Housing Units, and Employment by Jurisdiction

Jurisdiction	2022 Population	2022 Housing Units	2022 Jobs
Carlsbad	115,585	48,104	79,382
Chula Vista	276,785	88,143	74,728
Coronado	22,277	9,665	31,257

Region Total	3,287,306	1,235,642	1,611,632

Source: Data provided by SANDAG from the SANDAG 2025 Regional Plan Appendix F: Regional Growth Forecast, Sustainable Communities Land Use Pattern.

Population

The existing (2022) population of the San Diego region is 3,287,306. The city of San Diego is the most populous in the region with a population of 1,374,790, which is 42% of the regional total. The unincorporated county (513,170; 16%) and Chula Vista (276,785; 8%) have the second- and third-largest populations in the region, respectively. Approximately 66% of regional population is in these three jurisdictions. The cities of Oceanside (173,048; 5%) and Escondido (150,679; 5%) are the next most populated jurisdictions.

Existing Housing Units/Affordable Housing

As of 2022, there are 1,235,642 existing housing units in the San Diego region. Similar to existing population distribution, approximately 66% of existing housing units are in the city of San Diego (553,921; 45%), the unincorporated county (178,774; 14%), and Chula Vista (88,143; 7%). After these three jurisdictions, the cities of Oceanside (67,676; 5%) and Escondido (49,500; 4%) account for the most housing units. Figure 4.14-1 and 4.14-2 identify the location of housing and employment for 2035 and 2050, respectively.

The state of California faces a persistent housing crisis, and San Diego County is no exception. Between 1950 and 2019, the housing supply has not kept pace with the growing population of the San Diego region, resulting in rising housing prices. More affordable housing is needed for extremely low-, very low-, low-, and middle-income households. Steps at the local, regional, and state levels are being taken to address the availability and affordability of housing. For example, cities in the San Diego region have taken steps to increase affordable housing by making the development process faster and easier (City of San Diego 2020). The State of California offers Regional Early Action Planning (REAP) funds, which SANDAG uses for the Housing Acceleration Program (HAP) to provide grants to local jurisdictions to fund planning and capital projects related to the acceleration of housing production in smart growth planning areas. These grants can be used to fund infrastructure improvements to increase housing density (SANDAG 2025a). At the local level, agencies, such as the San Diego Housing Commission, work with developers to build deed-restricted units. Deed-restricted units have maximum rent restrictions, often based on federal, state, or city programs that subsidize the development or operation of the units. Depending on the type of affordability program and subsidy, rental housing regulations on units often have a set time period for affordability, which can be as long as 55 years (San Diego Housing Commission 2020).

Housing affordability is the product of two factors: household incomes and housing costs. Housing is considered affordable if total housing costs are below 30% of total household pretax income. In most U.S. cities, housing costs have grown faster than household incomes over the last decade, leading to a growing affordability challenge for low- and middle-income households. San Diego follows this trend, with the increase in median household income between 2010 and 2018 (15% inflation-adjusted; $69,200 to $79,700) lagging rent growth (17% inflation-adjusted; $1,450 to $1,700). In the same period, median home values increased by 31% (inflation-adjusted), from $469,300 to $614,000. This caused many households with moderate income (81–120% of area median income [AMI]) and above-moderate income (more than 120% of AMI) who may have previously purchased a home to remain in the rental market. As more of these households with moderate incomes and above continue to remain in the rental market, either due to a lack of homeownership options or changing preferences, households with low incomes and below compete for the same rental housing units. This further reduces rental vacancy rates, drives up rents, and increases the housing cost burden on those at the lower end of the income spectrum (San Diego Housing Commission 2020).

According to the California Housing Partnership Corporation, 134,537 low-income renter households lack access to affordable homes. State and federal funding for housing production and preservation decreased by 13% to $631 million. The burden is especially heavy on extremely low-income households, 81% of whom pay more than half their income on housing, compared to 2% of moderate-income households. In 2023, there were only 9,226 beds available for those experiencing homelessness. To afford the average rent of $2,479, renters must earn $47.67 per hour—2.8 times the city's minimum wage (CHPC 2024).

Employment

There are 1,611,632 existing (2022) jobs in the San Diego region. With 876,977 jobs, the jobs in city of San Diego account for 54% of regional employment. The next largest job centers are the unincorporated county (156,419; 10%), Carlsbad (79,382; 5%), and Chula Vista (74,728; 5%). According to the State of California Employment Development Department, the San Diego region had an unemployment rate of 4.4% and an available labor force of 1,671,000 (EDD 2025).

SANDAG REGIONAL GROWTH FORECAST SUMMARY

SANDAG has prepared regional growth forecasts for the San Diego region since the 1970s. The SANDAG forecasts are intended to help policy- and decision-makers prepare for the future and are not an expression for or against growth. The forecasts are developed through a collaborative effort with experts in demography, housing, the economy, and other disciplines, with the close cooperation of local planning directors and their staffs.

The Series 15 Regional Growth Forecast (Series 15 Forecast) projects a slower population growth rate compared to previous forecasts. The population forecast also highlights the shift in the drivers of population growth. Historically, natural change (births minus deaths) was the primary contributor to regional population increases, but this trend has been slowing. As illustrated in Figure 2-2 in Chapter 2, "Project Description," both natural change and net migration (the difference between in-migrants and out-migrants) have been declining since 2010. By 2030, natural change is projected to drop below net migration, meaning that net migration will become the primary driver of population growth. These trends reflect broader national patterns of lower birth rates and aging populations. As regional employment rises, vacancy rates fall, and the state's population increases, net migration for the region is projected to climb through the mid-years of the forecast. Over time, as these trends slow, and with the state's population growth expected to turn negative, net migration is forecasted to decrease, ultimately turning negative by the forecast's horizon.

Population Growth

From 2022 to 2050, the region is forecasted to have a population increase of 112,944 people—from 3,287,306 to 3,400,250, an increase of 3.4%. Table 4.14-2 shows existing population in 2022 and forecasted population growth for 2035 and 2050 for the region and the subregional allocation by jurisdiction based on the sustainable communities strategy (SCS) land use pattern.

Table 4.14-2 Existing and Forecasted Population Growth by Jurisdiction

Jurisdiction	Actual 2022	Projection 2035	Projection 2050	Change 2022–2050 Amount	Change 2022–2050 Percent
Carlsbad	115,585	120,002	116,776	1,191	1.0%
Chula Vista	276,785	307,392	324,927	48,142	17.4%
Coronado	22,277	21,904	21,222	-1,055	-4.7%

Vista	100,291	101,378	99,000	-1,291	-1.3%
Unincorporated	513,170	500,460	494,574	-18,596	-3.6%
Region Total	3,287,306	3,404,362	3,400,250	112,944	3.4%

Source: Data provided by SANDAG from the SANDAG 2025 Regional Plan Appendix F: Regional Growth Forecast, Sustainable Communities Land Use Pattern.

The highest population growth rate increases from 2022 to 2050 are forecasted to occur in the cities of Chula Vista (17.4%), San Marcos (17.4%), and Santee (6.5%). Approximately 41% of the population growth increase is forecasted for these three jurisdictions. Forecasted population growth rates in the cities of San Diego (4.8%) and Oceanside (6.0%) also would be higher than the regional average of 3.4%. Population growth rates are forecasted to be lower than the regional average in the north county coastal cities of Carlsbad (1.0%), Del Mar (-5.6%), Solana Beach (-5.2%), and Encinitas (-2.8%); the south county cities of Coronado (-4.7%), Imperial Beach (-3.4%), and National City (0.2%); the north county inland cities of Poway (-0.4%), Escondido (0.3%) and Vista (-1.3%); the east county cities of Lemon Grove (-3.6%), La Mesa (-2.1%), El Cajon (-6.1%), as well as the unincorporated county of San Diego (-3.6%).

Housing Units

From 2022 to 2050, the number of housing units in the region is forecasted to increase by 202,819, from 1,235,642 to 1,438,461, an increase of 16.4%. Table 4.14-3 shows existing housing units in 2022 and forecasted housing units for 2035 and 2050 for the region and the subregional allocation by jurisdiction based on the SCS land use pattern. This table does not include civilian (e.g., dormitories) or military (e.g., barracks) group quarters.

The highest rates of housing unit increases would occur in the cities of San Marcos (32.2%), Chula Vista (29.9%), Oceanside (20.5%), San Diego (19.4%), and Santee (16.9%). These forecasted housing unit increases will be higher than the projected regional average of 16.4%. The rates of housing unit increases are forecasted to be lower than the regional average in the north county coastal cities of Carlsbad (12.7%), Encinitas (7.9%), Solana Beach (5.7%), and Del Mar (4.2%); the north county inland cities of Poway (11.5%), Vista (10.1%), and Escondido (12.5%); and the east county cities of El Cajon (4.6%), La Mesa (7.3%), and Lemon Grove (8.2%); the south county cities of Coronado (3.1%), Imperial Beach (8.4%), and National City (13.9%), as well as the unincorporated county (7.2%).

Table 4.14-3 Existing and Forecasted Housing Growth by Jurisdiction

Jurisdiction	Actual 2022	Projection 2035	Projection 2050	Change 2022–2050 Amount	Change 2022–2050 Percent
Carlsbad	48,104	53,283	54,228	6,124	12.7%
Chula Vista	88,143	103,242	114,473	26,330	29.9%
Coronado	9,665	9,821	9,969	304	3.1%
Del Mar	2,629	2,738	2,740	111	4.2%
El Cajon	36,590	37,475	38,280	1,690	4.6%
Encinitas	26,665	28,235	28,773	2,108	7.9%
Escondido	49,500	53,764	55,686	6,186	12.5%
Imperial Beach	10,034	10,489	10,877	843	8.4%
La Mesa	26,265	27,229	28,180	1,915	7.3%
Lemon Grove	9,186	9,602	9,939	753	8.2%
National City	17,776	19,414	20,238	2,462	13.9%
Oceanside	67,676	78,381	81,544	13,868	20.5%
Poway	16,782	18,711	18,711	1,929	11.5%
San Diego	553,921	627,668	661,533	107,612	19.4%
San Marcos	32,314	41,439	42,709	10,395	32.2%
Santee	21,427	23,476	25,055	3,628	16.9%
Solana Beach	6,528	6,801	6,897	369	5.7%
Vista	33,663	36,102	37,062	3,399	10.1%
Unincorporated	178,774	185,014	191,567	12,793	7.2%
Region Total	1,235,642	1,372,884	1,438,461	202,819	16.4%

Source: Data provided by SANDAG from the SANDAG 2025 Regional Plan Appendix F: Regional Growth Forecast, Sustainable Communities Land Use Pattern.

Jobs

From 2022 to 2050, the number of jobs in the region is forecasted to increase by 170,757, from 1,611,632 jobs to 1,782,389 jobs, an increase of 10.6%. Table 4.14-4 shows existing jobs in 2022 and forecasted jobs for 2035 and 2050 for the region and the subregional allocation by jurisdiction based on the SCS land use pattern.

The highest rates of job increases would occur in the cities of Chula Vista (38%), Oceanside (35.7%), San Marcos (30.4%), Imperial Beach (49.9%), and Lemon Grove (18%), as well as the unincorporated county (11.5%). These forecasted job increases will be higher than the projected regional average of 10.6%. The rates of jobs increases are forecasted to be lower than the regional average in the City of San Diego (7.7%); the coastal cities of Carlsbad (7.5%), Encinitas (3.2%), Solana Beach (1.5%), Del Mar (1.3%); the north county cities of Poway (0.8%), Vista (6.8%) and Escondido (3.9%); the south county cities of Coronado (0.9%) and National City (8.2%); and the east county cities of El Cajon (10.2%), La Mesa (8.8%), and Santee (8.3%).

Table 4.14-4 Existing and Forecasted Job Growth by Jurisdiction

Jurisdiction	Actual 2022	Projection 2035	Projection 2050	Change 2022–2050 Amount	Change 2022–2050 Percent

4.14.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

Uniform Relocation Assistance and Real Property Acquisition Policies of 1970

The Uniform Relocation Assistance and Real Property Acquisition Policies Act (Uniform Act) (42 U.S. Code Section 4601 et seq.), passed in 1970 and amended in 1987, is intended to provide for uniform and equitable treatment for

persons displaced through federally funded or assisted transportation and redevelopment projects that require property acquisition. The act lays out rules for notification, relocation counseling, social services or assistance for disabled residents, and compensation for replacement housing and moving costs. The rules stipulate that replacement housing must be comparable to previous housing in terms of location, size, access to employment and public facilities, and must be "decent, safe, and sanitary." The rules apply if federal funds are used in any phase of the program or project, even if the property acquisition itself is not federally funded. Federal Highway Administration (FHWA) regulations implementing the Uniform Act are found at 49 Code of Federal Regulations Part 24.

Housing and Urban Development Regulations

The Housing and Community Development Act of 1974 (42 USC Section 5301 et seq.) and Section 8 of the Housing Act of 1937 establish federal guidelines for affordable housing and community development. These regulations provide funding mechanisms for housing assistance programs, support the development of low-income housing, and ensure equitable access to safe and sanitary living conditions. They also outline requirements for administering housing subsidies and grants to assist individuals and families in securing affordable housing options.

Federal Highway Administration and Federal Transit Administration Regulations

Federal Highway Administration and Federal Transit Administration regulations, outlined in 23 CFR 771 and 49 CFR Part 622, establish procedures for evaluating the environmental impacts of transportation projects, including effects on population and housing. These regulations require an assessment of housing displacement, population shifts, and impacts on social services resulting from transportation infrastructure development, particularly in areas undergoing urban expansion or redevelopment.

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

State Housing Element Law

State law requires that each city and county prepare and adopt a general plan for its jurisdiction that contains certain mandatory elements, including a housing element. (General plan requirements are described in Section 4.11, "Land Use and Planning.") The housing element is a comprehensive assessment of current and forecasted housing needs for all economic segments of the community. Among other things, housing elements must assess the jurisdiction's existing and forecasted housing needed, including the jurisdiction's fair share of regional housing needs identified in the Regional Housing Needs Assessment (RHNA). They also must identify adequate sites to meet the needs of households at all income levels (Government Code Section 65580 et seq.).

California Relocation Assistance Act

The California Relocation Assistance Act (Government Code Section 7260 et seq.) establishes uniform policies to provide for the fair and equitable treatment of people displaced from their homes or businesses as a direct result of state or local government projects or programs. The California Relocation Assistance Act requires that comparable replacement housing be made available to displaced people within a reasonable period of time prior to the displacement. Displaced people or businesses are assured payment for their acquired property at fair market value. Relocation assistance in the form of advisory assistance and financial benefits would be provided at the local level. This includes aid in finding a new home location, payments to help cover moving costs, and additional payments for certain other costs.

Jobs and Economic Improvement through Environmental Leadership Act of 2021 (Senate Bill 7)

On May 20, 2021, Governor Gavin Newsom signed into law SB 7, which extends expedited California Environmental Quality Act (CEQA) judicial review for small-scale housing developments. In 2011, AB 900 created an expedited judicial review process under CEQA for large, multi-benefit housing, clean energy, and manufacturing projects, provided that they met certain requirements, including provisions related to labor. SB 7 extends the provisions of AB 900 through the year 2025, and lowers the threshold for eligible housing projects. SB 7 provides benefits to projects that were previously certified under AB 900 but that did not receive project approvals by the prior deadline of January 1, 2021, and marks the first bill of the Senate's 2021 "housing package"

that targets California's ongoing housing crisis, with an emphasis on minimization of greenhouse gases and boosting employment opportunities.

SB 7 reenacts AB 900 and adds (1) eligibility for infill housing development projects with investments between $15 and $100 million (the previous threshold was $100 million and above); (2) a requirement of quantification and mitigation of the impacts of a project from the emissions of greenhouse gases with geographic restrictions for nonhousing development projects; (3) a revision of labor-related requirements for projects undertaken by both public agencies and private entities, adding "skilled and trained" workforce to the existing prevailing wage requirements; and (4) authorization for the governor to certify a project before the lead agency certifies the final EIR for the project or an alternative described in an EIR. SB 7 requires an applicant for certification of a project to (1) demonstrate that they are preparing the administrative record concurrently with the administrative process and (2) agree to pay the costs of both the trial court and court of appeal in hearing and deciding a case challenging a lead agency's action on a certified project.

Duplex Zoning Law (Senate Bill 9)

On September 16, 2021, Governor Gavin Newsom signed into law SB 9, which requires, for qualifying parcels, ministerial approval of two-unit housing developments in single-family zoning districts and would allow single-family parcels to be subdivided into two lots. Taken together, these provisions could allow for development of up to four housing units on lots where only one unit is currently permitted. SB 9 requires applicants for lot splits under this law to confirm that they intend to occupy one of the housing units as their principal residence for a minimum of 3 years, unless the applicant is a community land trust or qualified nonprofit corporation. Under SB 9, a local agency retains discretion to deny a proposed housing project if it finds that the project would have an adverse health and safety or environmental impact that cannot be feasibly mitigated or avoided. Local agencies are also required to prohibit use of the units for short-term rentals of 30 days or less.

CEQA Streamlining for Upzoning (Senate Bill 10)

Signed into law by Governor Newsom on September 16, 2021, SB 10 allows, but does not require, local agencies to avoid CEQA review when upzoning parcels to allow up to 10 units per parcel, at a height specified by local ordinance, if the parcel is located in a qualifying transit-rich area or an urban infill site. SB 10 does not provide new CEQA exemptions or streamlining for the projects that would be constructed on these upzoned parcels, but under existing law, certain CEQA exemptions or streamlining may be available on a case-by-case basis depending on project size, site conditions, and other factors. However, for larger residential or mixed-use projects with more than 10 units developed on one or more parcels upzoned pursuant to SB 10, the bill prohibits those projects from being approved ministerially or by right or from being exempt from CEQA with limited exceptions.

Affordable Housing And High Road Jobs Act (Assembly Bill 2011)

AB 2011, the Affordable Housing and High Road Jobs Act, was signed in September 2022 and became effective on July 1, 2023. AB 2011 creates a CEQA-exempt, ministerial approval process for multi-family housing projects on sites within a zone in which office, retail or parking are the principally permitted use. AB 2011 contains different qualifying criteria depending on if the proposed housing project is 100% affordable or a mixed-income project. To qualify, construction workers must be paid prevailing wages. Other labor standards are applicable if the project is more than 50 units.

Middle Class Housing Act (Senate Bill 6)

SB 6, the Middle Class Housing Act, was signed in September 2022 and became effective on July 1, 2023. Similar to AB 2011, SB 6 allows residential development on sites currently designated and zoned for office, retail or parking uses. Qualifying projects under SB 6, must be either all housing or a mixed-use development with at least 50% of the new construction dedicated to housing. Affordable housing is not required to qualify. The project must be located within an urbanized area or urban cluster with less than one-third of the site (or its immediate neighbors) dedicated to industrial uses. In addition, certain construction labor requirements must be met such as paying prevailing wages and utilizing skilled and trained workforce. SB 6 differs from AB 2011 in that it does not create a new approval process for such projects.

Accessory Dwelling Units: Local Ordinances: Separate Sale or Conveyance (Assembly Bill 1033)

AB 1033 was signed in October 2023 and became effective on January 1, 2024. AB 1033 allows local agencies, either by local ordinance or ministerial approval, to provide for the creation of accessory dwelling units (ADU) in areas zoned for residential use. In addition, AB 1033 authorizes a local agency to adopt an ordinance to allow for the separate conveyance of the primary dwelling unit and accessory dwelling unit or condominiums.

Housing Accountability Act: Housing Disapprovals: Required Local Findings (Assembly Bill 1893)

AB1893 was signed in September 2024 and became effective January 1, 2025. AB 1893 makes significant revisions to the Housing Accountability Act. Most notably, the bill specified that a local agency may disapprove or conditionally approve a housing development project as long as the local agency makes written findings that on the date that the housing development project was deemed complete, the jurisdiction did not have an adopted revised housing element that was in compliance with the State law, and the housing development project is not a builder's remedy project as defined under SB 167.

In addition, AB 1893 revises the definitions included in SB 167 including the definition of "housing development project" to expand the scope of mixed-use developments that qualify under the definition, and to include farmworker housing. AB 1893 also revises the definition of "disapprove the housing development project" to include any instance in which a local agency takes a final administrative action of the application where the application is disapproved and that a local agency disapproves the project if it undertakes certain acts such as failing to cease a course of conduct that effectively disapproves the proposed housing development without taking final administrative action if certain conditions are met. The bill also revised the definition of the term "housing for very low, low-, or moderate-income households" to mean housing for lower income households, mixed-income households, or moderate -income households.

AB 1893 also prescribes requirements that apply to a housing development project that qualifies as a builder's remedy project. These requirements include that a builder's remedy project is deemed to be in compliance with applicable residential density standards and objective zoning standards, objective subdivision standards, and objective design review standards necessary for the streamlined, ministerial approval processes defined under AB 2011.

Housing Development Approvals (Senate Bill 450)

SB 450 was signed in September 2024 and became effective January 1, 2025. SB 450 aims to streamline elements of SB 9 by prohibiting a local agency from imposing objective zoning standards, objective design standards, and objective subdivision standards that do not apply uniformly to developments within the underlying zoning designation. In addition, SB 450 would remove the authorization of a local agency to deny a proposed housing development if the building official makes a written finding that the proposed development project would have a specific, adverse impact on the environment. In addition, SB 450 would require the local agency to consider and approve or deny the proposed housing development application within 60 days from the date the local agency receives the completed application and would deem the application approved after that time. Furthermore, it requires that a permitting agency, which denies a housing development application, provide a full set of comments identifying items that define and include guidance on how the application can be remedied.

Assembly Bill 130

AB 130 was signed in June 2025 and went into effect immediately. AB 130 makes numerous changes to Californias housing laws including removing the sunset date on the five year limit on housing development projects established under SB 330, requiring that a local agency makes a determination whether the site of a housing development project is a historic site at the time the application is deemed complete, repealing the expiration provisions that were included in the Housing Crisis Act of 2019. In addition, AB 130 amends the Housing Accountability Act and Permit Streamlining Act to make elements of those laws permanent such as the rule that made housing development projects subject only to ordinances, policies, and standards that are in effect at the time when the preliminary application for the housing development project was submitted. AB 130 also revised the Permit Streamlining Act to cover any housing development project, regardless of whether the entitlement is ministerial or discretionary and established a new 60-day time limit to approve or disapprove ministerial projects.

Most notably, AB 130 included Public Resource Code Section 21080.66, which establishes a new statutory exemption for qualifying housing development projects that are 20 acres or less, or five acres or less in the case of a builder's remedy project site, and that:

- Are located in an incorporated city or urban area, and either previously developed or surrounded by urban uses,
- Are consistent with applicable local plans,
- Are at least half of the density that is deemed appropriate to accommodate lower-income households in the State Housing Element Law, as set forth in Gov. Code section 65583.2(c)(3)(B);
- Do not require demolition of a historic structure;
- Avoids hazardous sites and sensitive lands (e.g., prime farmland, wetlands, etc.);
- Do not include any transient lodging (e.g., hotel, motel, or bed and breakfast inn);
- Meet specific tribal consultation requirements and include mitigation for tribal cultural resources;
- Include a condition of approval requiring an environmental assessment for hazardous substance releases, with mitigation requirements based upon results;
- Comply with specific environmental hazard and air filtration standards if within 500 feet of a freeway;
- Comply with prevailing wage and other labor standards if over 85 feet or if 100% of units will be dedicated to lower-income households and with additional labor provisions for projects in San Francisco.

AB 130 also establishes a 30-day limit to approve or deny projects that qualify under the new exemption under Public Resource Code Section 21080.66.

Senate Bill 131

SB 131 was signed in June 2025 and went into effect immediately. SB 131 expanded current CEQA exemptions including exemptions to projects that would provide sewer service to a disadvantaged community so long as the project would not affect wetland or sensitive habitats, and exemptions to linear broadband projects within the public right of way to include local streets or roads. This bill primarily amends CEQA to expand the types of exemptions under CEQA to include:

- Rezoning that implements actions included in an approved housing element, new agricultural employee housing projects and projects consisting exclusively of the repair or maintenance of an existing farmworker housing project,
- Community water projects that do not include construction and result in long term benefits to climate resiliency
- Wildfire risk reduction projects
- Any activity or approval necessary planning, design, site acquisition, construction, operation, or maintenance of public park or nonmotorized recreational trail facilities
- Development, construction, or operation of a heavy maintenance facility or other maintenance facility for electrically powered high-speed rail.
- Day care centers
- Federally qualified food banks
- A Nonprofit foodbank or food pantry
- Projects that consist exclusively of advanced manufacturing facilities.

The Sustainable Communities and Climate Protection Act of 2008

The Sustainable Communities and Climate Protection Act of 2008 (SB 375) (Chapter 728, Statutes of 2008) requires metropolitan planning organizations (MPOs) like SANDAG to prepare an SCS as part of the RTP. The SCS must identify areas in the region sufficient to accommodate the housing needs of the entire population, including all economic segments, over the RTP's planning period. This includes accounting for net migration into the region, population growth, household formation, and employment growth, as specified in Government Code Section 65080.

Under SB 375, the preparation of the RHNA is coordinated with the SCS. The RHNA must allocate housing units in a manner consistent with the development pattern outlined in the SCS (Government Code Section 65584.04[i]). The SCS is required to use the most recent planning assumptions, including local general plans and other relevant factors (Government Code Section 65080[b][2][B]).

For regions like San Diego, which are classified as "non-attainment" areas under the federal Clean Air Act due to air quality challenges, SB 375 mandates that the RTP be updated every 4 years. Regional housing needs assessments and housing element schedules are synchronized with every other RTP update, requiring housing elements to be updated every 8 years and submitted no later than 18 months after RTP adoption.

The preparation of SANDAG's 2021 Regional Plan, which integrates the RTP and SCS, coincided with cycle 6 of the RHNA (April 15, 2021, to April 15, 2029). This ensures alignment between regional transportation, housing, and climate strategies, promoting a sustainable development pattern that addresses housing needs while reducing greenhouse gas emissions. Cycle 7 of the RHNA will coincide with preparation of SANDAG's Regional Plan anticipated for adoption in 2029.

California Building Standards Code

The minimum standards for structural design and construction in California are identified in the California Building Code (California Code of Regulations [CCR] Title 24). The 2022 triennial edition of Title 24 was published July 1, 2022, with an effective date of January 1, 2023. Information Bulletins 22-01 and 22-05 provide detailed information concerning changes to the 2022 publication. The 2022 California Building Standards Code contains the following 12 codes: Building, Residential, Electrical, Plumbing, Administrative, Mechanical, Energy, Historical Building, Fire, Existing Building, Green Building Standards (CALGreen), and the Reference Standards Code. These codes promote public health and safety and ensure that safe and decent housing is constructed in the San Diego region. The 2022 triennial edition remains in effect until the effective date of the 2025 triennial edition, which will become effective January 1, 2026.

LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

Regional Housing Needs Assessment

State law requires the California Department of Housing and Community Development (HCD) to determine each region's housing need in an RHNA and requires regions, such as SANDAG, to adopt a regional housing needs allocation plan (Government Code Sections 65584[a],[b]). The intent of the RHNA process is to create a better balance of jobs and housing in communities, ensure the availability of decent affordable housing for all income groups, and achieve sustainability through long-term strategic land use planning. In July 2020, the SANDAG Board of Directors adopted the 6th Cycle RHNA Plan, which allocates housing units to jurisdictions based on each jurisdiction's share of transit and jobs in the region. It also includes an equity adjustment allocating a lower proportion of housing need to an income category when a jurisdiction already has a disproportionately high share of households in that income category compared to the regional share (SANDAG 2021). The RHNA for the sixth housing element cycle has two main components:

- **RHNA Determination**—HCD determination of the regionwide housing units needed during the housing element cycle
- **RHNA Plan**—The SANDAG plan to allocate the RHNA Determination housing units to each local jurisdiction by four income categories

In July 2018, SANDAG received the RHNA Determination from HCD, requiring that the region plan for 171,685 housing units during the sixth housing element cycle, which covers the years 2021 through 2029. The housing units are divided into four income categories shown in Table 4.14-5 below.

Table 4.14-5 Housing Unit Needs in the San Diego Region Sixth Housing Element Cycle (2021–2029)

Income Category	Housing Unit Need	Percentage
Very low	42,332	24.7
Low	26,627	15.5
Moderate	29,734	17.3
Above moderate	72,992	42.5
Total housing units	171,685	100

Source: SANDAG 2021.

Following adoption of the 6th Cycle RHNA Plan, jurisdictions in the region updated their housing elements to identify adequate sites to accommodate the RHNA allocations. Every jurisdiction in the San Diego region has since adopted a housing element approved by HCD. The adopted housing elements informed development of the proposed Plan's SCS land use pattern, setting forth a forecasted development pattern for the region. The SCS land use pattern identifies areas in the region sufficient to house the projection of regional housing need determined by HCD and includes general plan zoning assumptions for each jurisdiction that meet the housing unit allocations in the RHNA Plan.

Housing Elements of Local Jurisdictions

Each city and the county has developed and must periodically update a housing element as part of its general plan per requirements of the State Housing Element Law. The RHNA Plan allocates housing needs in the four income categories to each of the cities and county to use in their housing element updates. The housing element is a comprehensive assessment of current and forecasted housing needs for all economic segments of the community. It includes an inventory of land suitable for residential development and a zoning analysis to demonstrate the jurisdiction's ability to accommodate its housing unit allocation; it also sets forth local housing policies and programs to implement those policies. The cities and county are required to update their housing elements to include RHNA Plan allocations every 8 years; updates can be required every 4 years if updated housing elements are not adopted by certain deadlines (Government Code Section 65588[e]). Many jurisdictions in the region are in their sixth cycle of housing element updates.

Land Use Elements of Local Jurisdictions

Each local city and the county have developed a land use element as part of its general plan per requirements of State Planning and Zoning Law (Government Code Section 65000 et seq.). The land use element designates the general location and intensity of housing, business, industry, open space, education, public buildings and grounds, waste disposal facilities, and other land uses.

Local Coastal Programs of Local Jurisdictions

Local jurisdictions in the Coastal Zone may prepare a local coastal program (LCP) for approval by the Coastal Commission. LCPs implement the goals, policies, and requirements of the Coastal Act, including those pertaining to housing, in a local jurisdiction.

In the San Diego region, several jurisdictions have developed LCPs, including:

- **City of San Diego**: The city's LCP encompasses multiple segments corresponding to its coastal communities, such as La Jolla, Pacific Beach, and Ocean Beach (California Coastal Commission 2016). Each segment includes specific land use plans and implementation ordinances tailored to the unique characteristics of the community and are included within their respective Community Plans.

- **County of San Diego**: The county's LCP covers the unincorporated areas within the coastal zone, notably the San Dieguito community, including San Dieguito Park. The LCP consists of a land use plan and an implementation plan, guiding development and protecting coastal resources in these areas (County of San Diego 2018).

These LCPs are essential tools for managing coastal development, ensuring public access, and protecting coastal resources in alignment with the California Coastal Act.

4.14.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts in the form of initial study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the CEQA Guidelines Appendix G checklist questions. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR, and the unique characteristics of the proposed Plan.

Checklist questions for population and housing are provided in Section XIV of CEQA Guidelines Appendix G. To better focus the potential impacts associated with the proposed Plan, the CEQA Guidelines Appendix G questions have been combined and modified. Specifically, criteria (b) and (c) are combined since criteria (b) and (c) in CEQA Guidelines Appendix G relate to displacement of a substantial number of existing housing units and displacement of a substantial number of people. These two questions have been combined in this document (POP-2) because both focus on the need for construction of replacement housing as a result of substantial displacement. Therefore, Implementation of the proposed Plan would have a significant population and housing impact if it would:

POP-1 Induce substantial unplanned population growth to areas of the region either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., by extending roads and other infrastructure).

POP-2 Displace substantial numbers of people or housing units, which would necessitate the construction of replacement housing elsewhere.

The analysis discloses impacts to population and housing. There is insufficient evidence to support a meaningful analysis of how the proposed Plan's population and housing impacts would be worsened by climate change. Therefore, a climate change analysis for population and housing is not included in this section.

4.14.4 Environmental Impacts and Mitigation Measures

POP-1 INDUCE SUBSTANTIAL UNPLANNED POPULATION GROWTH TO AREAS OF THE REGION EITHER DIRECTLY (E.G., BY PROPOSING NEW HOMES AND BUSINESSES) OR INDIRECTLY (E.G., BY EXTENDING ROADS AND OTHER INFRASTRUCTURE).

Analysis Methodology

This section analyzes whether substantial increases in unplanned population growth would be induced by the proposed Plan based on the Series 15 Regional Growth Forecast, SCS land use pattern, and proposed transportation network improvements and programs. Growth inducement is discussed further in Chapter 6, "Other Considerations Required by CEQA." The secondary impacts of the proposed Plan's population growth are the physical changes to the environment already analyzed in the other environmental issue area sections of this EIR (Sections 4.1 through 4.19); they are not addressed in this section.

Proposed projects related to the transportation network improvements and programs, including those that potentially could indirectly induce unplanned growth, can be found in Chapter 2, Project Description, are listed in Tables 2-7 to 2-11 and shown on Figures 2-15 to 2-18.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

As discussed above and in Chapter 2, "Project Description," as regional employment rises, vacancy rates fall, and the state's population increases, net migration for the region is projected to climb through the mid-years of the forecast. Over time, as these trends slow, and with the state's population growth expected to turn negative, net migration is forecasted to decrease, ultimately turning negative by the forecast's horizon.

New development caused by regional growth and land use change would be in the form of new homes, services, commercial areas, industrial centers, schools, and civic uses. Additionally, the proposed Plan forecasts a general intensification of existing land uses in urban communities and along key transportation corridors consistent with jurisdiction general plans. By 2035, the land use components of the proposed Plan would induce population increases in the specific locations described above through policies and strategies that provide for the development of new housing units, job-supporting nonresidential land uses, and related improvements to public facilities and infrastructure.

As discussed above, Government Code Section 65080(b)(2)(B)(ii) requires that the RTP/SCS accommodate all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan. In accordance with these requirements, the projected housing mix would help the region accommodate the projected housing needs over the life of the proposed Plan, especially housing needs for the lower income segments.

As mandated by State Housing Law as part of the periodic (every 8 years) process of updating local housing elements of general plans, SANDAG is responsible for the allocation of regional housing need to jurisdictions in the region. As discussed in Section 4.14.2, "Regulatory Setting," SANDAG adopted its sixth cycle RHNA Plan in July 2020. Every jurisdiction in the San Diego region has since adopted a housing element approved by HCD. The adopted housing elements informed development of the SCS land use pattern, setting forth a forecasted development pattern for the region. The SCS land use pattern identifies areas in the region sufficient to house the projection of regional housing need determined by HCD and includes general plan zoning assumptions for each jurisdiction that meet the housing unit allocations in the RHNA Plan.

Implementation of the proposed Plan's forecasted development pattern would accommodate the projected 11% future housing growth and 4% future employment growth in 2035 while remaining consistent with local plans. The proposed Plan would move the region toward more compact, mixed-use development with a variety of housing types leading to more opportunities for walking and biking, more transit use, and shorter auto trips. Overall, the proposed Plan accommodates anticipated growth consistent with local plans rather than inducing unplanned growth. Therefore, implementation of the proposed Plan would not induce unplanned growth in the region, resulting in a less than significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as

interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

Transportation improvements are informed by recent and historical data trends, as well as input from regional stakeholders, to address evolving travel demands and needs. The proposed Plan relies on data-driven insights to evaluate the best investments for meeting current and future regional needs. These needs include more transit options, more Flexible Fleet options, and more opportunities for biking, walking, and other forms of active transportation.

Although the Series 15 Forecast projects an aging population and a decrease in total population in the later years of the proposed Plan, housing shortages will continue to drive demand for housing and job opportunities. Although job growth is anticipated, many positions may be filled by commuters from outside the region. These demographic and economic shifts influence travel demands and inform the vision for the region's future transportation system.

Data also reveals that approximately one-quarter of regional transit trips are linked to shopping, dining, or visiting attractions, whereas one-third of all travel in the region is dedicated to these activities. This underscores the importance of a well-connected transportation network to support the needs of all travelers, whether residents or visitors.

The planned transportation improvements and programs would help facilitate movement of people and goods and accessibility to improve the quality of life and sustain the economy as the region grows. The transportation improvements and programs emphasize more efficient use of the existing highway and arterial networks and an enhanced transit network that would facilitate greater mobility between communities and employment or commercial centers within the region. Enhanced mobility would support forecasted regional growth by increasing the accessibility to and from areas of the region that are forecasted to increase housing or employment development. Transportation strategies included in the proposed Plan would support increased density in existing urban areas by facilitating travel and would not be expected to induce unplanned population growth because these projects are growth accommodating and generally are aimed at improving the existing transportation networks. Transportation projects and transit improvements, although not adding new homes or businesses directly, have the potential to create demand for new development around transit stations. However, many communities foresee these types of development and plan for them accordingly.

Additionally, the integrated transportation investments and land use strategies in the proposed Plan would influence economic (jobs) and household growth in some areas and could remove some obstacles to growth in other parts of the region. Specifically, improved accessibility and connectivity potentially gained from transportation investments in the proposed Plan could facilitate population and economic growth in areas of the region that are currently not developed or underdeveloped, such as Complete Corridors and Flexible Fleets projects located in the East County and Rural Areas region of the Plan. Increased accessibility and connectivity to these areas could attract growth opportunities as residents look to relocate to more affordable areas outside of the urban core. Therefore, implementation of the proposed Plan in 2035 would indirectly induce unplanned growth in some areas of the San Diego region, resulting in a significant impact.

2035 Conclusion

Implementation of transportation network improvements, but not regional growth and land use change, would induce unplanned growth in some areas of the San Diego region. Therefore, this impact (POP-1) in the year 2035 is significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, regional population is forecasted to decrease by 4,112 people (-0.1%). Housing is forecasted to increase by 65,577 units (4.8%), and employment is forecasted to increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5 in Chapter 2, "Project Description." The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated county, and the cities of Carlsbad and El Cajon. Approximately 78.8% of new housing units are in the cities of San Diego (51.6%) and Chula Vista (17.1%) and the unincorporated county. Similarly, these same two jurisdictions contribute to approximately 70.3% of new jobs between 2036 and 2050.

Implementation of the proposed Plan's forecasted development pattern would accommodate the projected 4.8% future total housing growth and 6.2% future employment growth in 2050 while remaining consistent with local plans. Similar to the 2035 analysis, regional growth and development in the region would be more compact, mixed-use development with a variety of housing types leading to more opportunities for walking and biking, more transit use, and shorter auto trips. Overall the proposed Plan accommodates anticipated growth consistent with local plans rather than inducing unplanned growth. Therefore, implementation of the proposed Plan would not induce unplanned growth in the region, resulting in a less than significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period.

Between 2036 and 2050, most transportation network improvements would affect existing transportation facilities. The location and timing of transportation network improvements and programs identified in the proposed Plan would accommodate forecasted regional growth in population in the specific locations described in this section where the development of new housing units and jobs-supporting nonresidential land uses would occur.

The planned network improvements and programs would help facilitate movement of people and goods and accessibility to improve the quality of life and sustain the economy as the region grows. The transportation network improvements and programs emphasize more efficient use of the existing highway and arterial networks, and an enhanced transit network that would facilitate greater mobility between communities and employment or commercial centers in the region. Enhanced mobility would support forecasted regional growth by increasing the accessibility to and from areas of the region that are forecasted to increase housing or employment development. In areas where transit improvements are implemented in addition to roadway improvements, greater intensity of growth can be accommodated. Specifically, improved accessibility and connectivity potentially gained from transportation investments in the proposed Plan could facilitate population and economic growth in areas of the region that are currently not developed or are underdeveloped, such as Complete Corridors and Flexible Fleets projects located in the East County and Rural Areas region of the Plan. Increased accessibility and connectivity to these areas could attract growth opportunities as residents look to relocate to more affordable areas outside of the urban core. Therefore, implementation of the proposed Plan through 2050 would indirectly induce unplanned growth in some areas of the San Diego region, resulting in a significant impact.

2050 Conclusion

Implementation of the transportation network improvements, but not regional growth and land use change, would induce unplanned growth in some areas of the San Diego region. Therefore, this impact (POP-1) in the year 2050 is significant.

MITIGATION MEASURES

POP-1 INDUCE SUBSTANTIAL UNPLANNED POPULATION GROWTH TO AREAS OF THE REGION EITHER DIRECTLY (E.G., BY PROPOSING NEW HOMES AND BUSINESSES) OR INDIRECTLY (E.G., BY EXTENDING ROADS AND OTHER INFRASTRUCTURE).

2035, 2050

POP-1a Coordinate with Local Jurisdictions to Reduce Substantial Unplanned Population Growth.
Implementation of the proposed Plan through 2050 would indirectly induce unplanned population growth in areas of the region that are currently not developed or are underdeveloped. SANDAG shall, and other transportation project sponsors can and should:

- implement early coordination with local jurisdictions to anticipate and plan for substantial unplanned growth impacts resulting from transportation network improvements
- work with local jurisdictions to identify opportunities to develop housing as part of transportation projects.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Consistent with the discussion above, impacts related to induced substantial unplanned population growth under the proposed Plan would be significant and unavoidable. The coordination measures required under POP-1a would require SANDAG, and encourage other transportation project sponsors, to support local jurisdictions in efforts to prepare for anticipated substantial unplanned growth resulting from transportation network improvements through early coordination and identification of opportunities to develop housing as part of transportation projects.

While these measures would reduce the proposed Plan's indirect impacts associated with substantial unplanned growth on local housing infrastructure, there may still be transportation projects where such early coordination is not feasible. Finally, SANDAG cannot require implementing agencies other than SANDAG to adopt mitigation measures where SANDAG is not the lead agency, and it is ultimately the responsibility and jurisdiction of the implementing agency to determine and adopt project-specific mitigation. Thus, the project's impacts on substantial unplanned population growth under the proposed Plan would remain significant and unavoidable after mitigation.

POP-2 DISPLACE SUBSTANTIAL NUMBERS OF PEOPLE OR HOUSING UNITS, WHICH WOULD NECESSITATE THE CONSTRUCTION OF REPLACEMENT HOUSING ELSEWHERE.

Analysis Methodology

This analysis examines whether forecasted regional growth and land use change and planned transportation network improvements would physically displace a substantial number of people or housing units, necessitating the construction of replacement housing elsewhere. The significance of the impact is determined by the degree to which new housing units are needed elsewhere, the construction of which would have the potential to result in a significant physical impact on the environment. Because the degree to which displacement occurs is based on a variety of factors, such as details of actual development project proposals; economic factors, including land costs; and other inputs, the analysis does not quantify numbers of people or housing units that would be displaced but instead focuses on the potential for substantial displacement to occur with implementation of the proposed Plan.

For regional growth, the "Impact Analysis" section below analyzes forecasted development patterns throughout the region as represented in the proposed Plan, including new growth in existing urbanized areas. The regional growth and land use changes forecasted for each horizon year are used to describe how the proposed Plan may shape future development patterns that, as a consequence of the proposed Plan's implementation, would result in the construction of replacement housing elsewhere to offset the displacement of people and housing that could

occur under the proposed Plan. The analysis also includes a qualitative discussion that describes how the forecasted growth and land use changes under the proposed Plan may affect the affordable housing stock.

For transportation network improvements, the analysis describes how transportation projects may require new right-of-way (ROW) acquisitions that contribute to the physical displacement of people and housing units. Displacement of housing was assessed qualitatively by considering the possibility of major transportation projects to impact surrounding land uses and community development. Highway and transit/rail extensions and major interchange projects were assumed to have a higher potential to result in the physical displacement of people and housing units because they would involve the creation of new roadways. Highway widening and other projects along established transportation ROWs were assumed to have a lower potential to physically displace people and housing units.

A 500-foot potential impact zone was drawn around the freeway, rail, and transit projects in the proposed Plan Area to compute the number of acres that could be affected by the construction and operation of major transportation projects under the proposed Plan. Table 4.14-6 shows the results of the analysis with the potential acreage of these affected areas within the region.

Table 4.14-6 Potential Displacement of Existing Residential and Commercial Land Uses by Transportation Projects (in acres)

Land Use	2035	2050
Developed	0	0
Agriculture	0	0
Commercial and office	4	24
Education and institutions	0	0
Heavy and light industry	1	2
Military	0	0
Mixed use	30	81
Mobile homes	347	479
Multifamily residential	1,176	1,898
Open space parks	0	0
Recreation	0	0
Single-family residential	2,855	4,600

Spaced rural residential	880	1,777
Vacant	0	0
Water	0	0
Total	5,295	8,861

Source: SANDAG 2025b.

Transportation improvements that would potentially occur under the proposed Plan for each horizon year are compared with the existing transportation facilities and existing development (i.e., population and housing locations) to determine if implementation of the proposed Plan would necessitate the construction of replacement housing elsewhere. Similar to the analysis for regional growth, a qualitative discussion is provided to describe how the transportation network improvements under the proposed Plan may affect the affordable housing stock.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. The SCS land use growth pattern indicates there would be an adequate number of residential units planned to meet the forecasted demand, taking into account localized displacement of some households within the region.

Existing laws are in place to provide assistance to relocated households and businesses. As described in Section 4.14.2, "Regulatory Setting," under the Federal Uniform Act and California Relocation Assistance Act, public agencies must provide relocation assistance when an action by an agency displaces residences.[1] Construction of replacement housing outside the region would, however, be unlikely, because adopted land use plans have sufficient capacity to accommodate forecasted population and housing growth.

The intensification of development forecasted between 2022 and 2035 could lead to the redevelopment of existing properties containing lower-density residential uses. These projects may be exempted from further CEQA review if they qualify under SB 10 or AB 2011. Existing structures would be replaced with higher-density housing or mixed-use commercial structures, leading to substantial displacement of people or housing units, including affordable housing units, necessitating the construction of replacement housing elsewhere. Thus, regional growth and land use change could cause the displacement of a substantial number of people and housing units, necessitating the construction of replacement housing elsewhere, resulting in a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

Most transportation network improvements from 2035 to 2050 are investments in active transportation, complete corridors, and public transit located in established communities, such as the addition of managed lanes along Interstate I-5, I-15 and State Route 52, as well as operational improvements along State Routes and Interstates in the project area. Active transportation projects and improvements to regional arterials, would primarily be the installation of new bikeways and upgrades to existing bikeways along or within existing transportation alignments. Public transit projects would focus on existing bus route service improvements and light rail improvements such as the planned grade separation for the Orange light rail line between El Cajon and Downtown San Diego.

The proposed Plan's improvements to existing transportation facilities would likely involve temporary and permanent ROW acquisition. Highway and transit/rail extensions and major interchange projects would have a

[1] California Relocation Assistance Act applies to projects undertaken by the lead agency and/or in which a developer is working on behalf of the public agency beyond the need for regulatory approval or permitting (Government Code Section 7260[A]).

higher potential to result in the physical displacement of people and housing units because they would involve the creation of new roadways. These improvements are unlikely to involve acquisitions of property that would displace substantial numbers of people or housing units. However, it cannot be guaranteed that all future transportation improvements would avoid acquisition of properties that would result in substantial displacement of people or housing units, including affordable housing units. Individual transportation network improvements would undergo separate environmental review under CEQA and NEPA where applicable. The corresponding project-specific environmental documentation would identify significant impacts with regard to displacement of people or housing units, and identify mitigation measures to avoid or lessen the substantial displacement of people or housing units.

Additionally, existing laws are in place to provide assistance to relocated households and businesses. As described in Section 4.14.2, "Regulatory Setting," the Federal Uniform Act and California Relocation Assistance Act require public agencies to provide relocation assistance when an action by the agency displaces residences or businesses. Construction of replacement housing outside the region would be unlikely because adopted land use plans have sufficient capacity to accommodate forecasted population and housing growth. Nevertheless, it cannot be concluded that all project-level displacement of people or housing units associated with planned rail extensions would be avoided or substantially lessened.

As shown in Table 4.14-6 above, 5,258 acres of residential land uses could be affected by planned transportation improvements by 2035. Therefore, transportation network improvements could displace substantial numbers of existing residences, which would necessitate the construction of replacement housing elsewhere, resulting in a significant impact.

2035 Conclusion

Between 2022 and 2035, development associated with regional growth and land use change and planned transportation network improvements could displace a substantial number of people and existing housing units, necessitating the construction of replacement housing elsewhere. Therefore, this impact (POP-2) in the year 2035 is significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. The projected land use strategy in 2050 would accommodate 65,577 housing units and 103,460 jobs between 2036 and 2050, which would be consistent with population and employment growth projections in the San Diego region. As stated in the 2035 analysis, the SCS land use growth pattern indicates that there is an adequate number of residential units to meet the forecasted demand, taking into account localized displacement of some households within the region. Thus, implementation of the proposed Plan would not result in displacement at the regional scale, and impacts at the regional level would be less than significant.

Existing laws are in place to provide assistance to relocated households and businesses. As described in Section 4.14.2, "Regulatory Setting," under the Federal Uniform Act and California Relocation Assistance Act, public agencies must provide relocation assistance when an action by the agency displaces residences.[2] Construction of

[2] California Relocation Assistance Act applies to projects undertaken by the lead agency and/or in which a developer is working on behalf of the public agency beyond the need for regulatory approval or permitting (Government Code Section 7260[A]).

replacement housing outside the region would, however, be unlikely, as adopted land use plans have sufficient capacity to accommodate forecasted population and housing growth.

Similar to the discussion for the year 2035, the intensification of development forecasted for 2050 would lead to the redevelopment of existing properties containing lower-density residential uses. These projects may be exempted from further CEQA review if they qualify under SB 10 or AB 2011. Existing structures would be replaced with higher-density housing or commercial structures and would lead to substantial displacement of people or housing units, including affordable housing units, necessitating the construction of replacement housing elsewhere. Thus, regional growth and land use change could cause the displacement of a substantial number of people and housing units, necessitating the construction of replacement housing elsewhere, a significant impact.

Transportation Network Improvements and Programs

Most transportation network improvements from 2035 to 2050 are investments in active transportation, complete corridors, and public transit located in established communities, such as the addition of managed lanes along Interstate I-5 through the coastal cities of Encinitas, Carlsbad, and Oceanside; and operational improvements along State Routes in the project area, including the signalization of highway ramps. Active transportation projects and improvements to regional arterials, would primarily be upgrades to existing bikeways along or within existing transportation alignments. Public transit projects would focus on rail improvements including grade separations throughout the Plan area.

Between 2036 and 2050, most or all of the proposed Plan's transportation network improvements would be implemented. As discussed in the 2035 analysis, highway and transit/rail extensions and major interchange projects were assumed to have a higher potential to result in the physical displacement of people and housing units because they would involve the creation of new roadways. It cannot be guaranteed that all proposed improvements would avoid acquisition of residential properties that would result in substantial displacement of people or housing units, including affordable housing units. Individual transportation network improvements would undergo separate environmental review under CEQA and NEPA where applicable. The corresponding project-specific environmental documentation would identify significant impacts with regard to displacement of people or housing units, including affordable housing, and mitigation measures to avoid or lessen the substantial displacement of people or housing units.

As described in Section 4.14.2, "Regulatory Setting," the Federal Uniform Act and California Relocation Assistance Act require public agencies to provide relocation assistance when an action by the agency displaces residences or businesses. Although existing laws are in place to provide assistance to relocated households and businesses, it cannot be concluded that all project-level displacement of people or housing units associated with planned rail extensions and proposed new streetcars would be avoided or substantially lessened.

As shown in Table 4.14-6 above, 8,754 acres of residential land uses could be affected by planned transportation improvements by 2050. Therefore, transportation network improvements could displace substantial numbers of existing residences, which would necessitate the construction of replacement housing elsewhere, resulting in a significant impact.

2050 Conclusion

Between 2036 and 2050, development associated with regional growth and land use change and planned transportation network improvements could displace a substantial number of people and existing housing units, necessitating the construction of replacement housing elsewhere. Therefore, this impact (POP-2) in the year 2050 is significant.

MITIGATION MEASURES

POP-2 DISPLACE SUBSTANTIAL NUMBERS OF PEOPLE OR HOUSING UNITS, WHICH WOULD NECESSITATE THE CONSTRUCTION OF REPLACEMENT HOUSING ELSEWHERE.

2035, 2050

POP-2a Design Development Projects to Reduce Displacement.
During planning, design, and project-level CEQA review of land development projects, the County of San Diego, cities, and other local jurisdictions can and should develop design strategies to avoid or reduce substantial displacement of people or housing units, including affordable housing units, where consistent with overall goals to promote housing growth, including the provision of affordable housing. For development projects that would displace people or housing units, alternative designs to retain existing housing on-site, alternative project site locations and provision of replacement housing as a mitigation measure can and should be evaluated. While displacement should be considered during project evaluations, avoidance or reduction of displacement should not be employed where it would undermine achievement of housing goals, including the development of transit-oriented development and the provision of affordable housing.

POP-2b Design Transportation Network Improvement Projects to Reduce Displacement.
SANDAG shall, and other transportation project sponsors can and should, identify feasible project alignments during planning, design, and project-level CEQA review that avoid or reduce permanent property acquisitions that would result in the substantial displacement of people or housing units. Where avoidance is not feasible, measures to reduce substantial displacement should be considered including, but not limited to, the following:

- selecting alignments within existing public ROWs
- designing sections above- or below-grade to avoid property acquisition that would cause displacement of people or housing units, including affordable housing
- selecting alignments in properties that result in the least amount of displacement; for example, acquiring vacant or undeveloped portions of property rather than portions occupied by housing units
- working with local jurisdictions to identify opportunities to develop housing as part of transportation projects.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of Mitigation Measures POP-2a and POP-2b would reduce the displacement of people and housing units. However, there is no guarantee that significant displacement impacts would be reduced to less-than-significant levels for all projects. Therefore, displacement resulting from regional growth and land use change and transportation network improvements is a significant and unavoidable impact of implementing the proposed Plan.

4.14.5 Cumulative Impacts Analysis

C-POP-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO POPULATION AND HOUSING

The area of geographic consideration for cumulative impacts is the Southern California and Northern Baja region. Large-scale land use change and the effectiveness of the transportation system influence the regional development pattern that dictates the location, timing, and amount of resulting population and housing increases or decreases across the region as a whole. If growth is not accommodated in one specific area, it would likely be accommodated at another locale within the general area. Thus, the entire region needs to be considered when addressing population and housing.

A projection approach is used for the cumulative analysis of population and housing impacts because growth, land use change, and transportation network improvements across the region can substantially impact and modify population and housing by supporting and facilitating the addition or displacement of homes and population on a large scale. A significant cumulative impact on population and housing would occur if the proposed Plan would result in incremental effects that are considered cumulatively significant when considered in combination with the effects of population and housing impact projections identified in adopted plans. Significant cumulative impacts related to population and housing would occur if the proposed Plan and other planning documents would induce substantial increases in unplanned population growth or contribute to displacement of a substantial number of existing people or housing units, which would necessitate the construction of replacement housing elsewhere.

This cumulative impact assessment considers and relies on the impact analysis in this EIR for the proposed Plan; SCAG Connect SoCal 2024 EIR (SCAG 2024); and the California-Baja California Border Master Plan (Caltrans and SIDURT 2021). Information on population forecasts and transportation network improvements was compiled from the documents listed in Section 4.0, *Environmental Impact Analysis.* Table 4-1 shows these population forecasts for 2035 and 2050. Information on planned residential development and land use changes in Southern California is also available in adopted land use plans for individual cities and counties.

Impacts of the Proposed Plan

Implementation of planned transportation network improvements would induce unplanned growth in some areas of the San Diego region in 2035 and 2050. This is considered a significant impact (Impact POP-1). By 2035 and 2050, the proposed Plan's regional growth and land use change would have the potential to displace a substantial number of residences, necessitating the construction of replacement housing elsewhere. Transportation network improvements, such as new rail extensions, would also have the potential to displace a substantial number of people and existing housing units. Therefore, impacts related to the displacement of a substantial number of people and existing housing units, necessitating the construction of replacement elsewhere is significant in 2035 and 2050 (Impact POP-2).

Impacts of Projections in Adopted Plans

According to the EIR prepared for the SCAG Connect SoCal 2024, Connect SoCal 2024 would facilitate population growth in some areas of the SCAG region. The SCAG Connect SoCal 2024 also found that transportation network improvements would displace a substantial number of existing homes due to ROW acquisitions. The Connect SoCal 2024 would influence the pattern of growth in the region through transportation investments and land use strategies that would contribute to a cumulatively considerable increase in population outside the region. These impacts were found significant and unavoidable (SCAG 2024).

The California-Baja California Border Master Plan is a binational comprehensive approach to coordinate planning and delivery of projects at land ports of entry (POEs) and transportation infrastructure serving those POEs in the California-Baja California region. The projects included in the Master Plan would support and facilitate current and projected cross-border travel demand and economic activity as populations on both sides of the border are forecasted to increase. Thus, the Master Plan would induce population growth and economic development.

Adopted land use plans for local jurisdictions in Southern California and Northern Baja would induce population growth through policy changes and zoning amendments that encourage and facilitate increased residential and employment growth. Some of this growth, particularly in currently built-out locations, would be driven by redevelopment in existing urban areas as communities increase their housing and commercial densities. For redevelopment to occur, existing housing and population would likely be displaced.

Cumulative Impacts and Impact Conclusions

2035

Implementation of the transportation network improvements associated with the proposed Plan by 2035 would induce substantial unplanned population growth. Implementation of the regional growth and land use change and transportation network improvements would also displace a substantial number of existing homes and

population. In addition, population and housing impacts were also identified in other land use plans would contribute to substantial unplanned population growth and displacement of homes or population. The combination of the direct population and housing impacts from the proposed Plan and these adopted plans would result in significant cumulative population and housing impacts in the Southern California and Northern Baja region by 2035. Because cumulative population and housing impacts throughout the Southern California and Northern Baja region by 2035 would be significant and because the proposed Plan's incremental impacts are significant, the proposed Plan's incremental population and housing impacts are also cumulatively considerable and thus significant (Impact C-POP-1).

2050

As discussed in the 2035 analysis, implementation of the transportation network improvements associated with the proposed Plan would induce substantial unplanned population growth. Implementation of the regional growth and land use change and transportation network improvements would also displace a substantial number of existing homes and population. While the analysis of the SCAG 2020-2045 RTP/SCS does not extend to 2050, regional population growth and associated impacts would continue through this timeframe, as would impacts of growth in Northern Baja.

Although currently adopted land use plans rarely extend to 2050, local infrastructure improvement projects, policy changes, and zoning amendments that support residential and employment growth would induce population growth beyond their timeframes. Policy changes and zoning amendments that allow and encourage higher-density residential and employment uses would likely continue to displace existing homes and population. When considered along with the direct population and housing impacts from the proposed Plan and these projects and adopted plans, the incremental impacts would result in significant cumulative population and housing impacts in the Southern California and Northern Baja region by 2050.

Because cumulative population and housing impacts throughout the Southern California and Northern Baja region by 2050 would be significant and because the proposed Plan's incremental impacts are significant, the proposed Plan's incremental population and housing impacts are also cumulatively considerable (Impact C-POP-1).

MITIGATION MEASURES

C-POP-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO POPULATION AND HOUSING

Therefore, Mitigation Measure POP-1a calls for collaboration between transportation project sponsors and affected local jurisdictions on transportation network improvements to reduce substantial unplanned growth. Even with implementation of mitigation, substantial unplanned growth impacts would be significant and unavoidable.

Mitigation Measures POP-2a and POP-2b call for project designs that reduce displacement. Even with implementation of mitigation, displacement impacts would be significant and unavoidable.

Therefore, the proposed Plan's incremental contributions to cumulative population and housing impacts in years 2035 and 2050 would remain cumulatively considerable post-mitigation.

This page is intentionally left blank.

4.15 PUBLIC SERVICES, RECREATION, AND UTILITIES

This section evaluates the potential public services, recreation, and utilities impacts of the proposed Plan. Impacts of the proposed Plan on the San Diego region's water supply and water infrastructure are discussed in Section 4.18 "Water Supply." Impacts of the proposed Plan related to wildfire are discussed in Section 4.19 "Wildfire"; this section only addresses environmental impacts related to fire protection services facilities.

4.15.1 Existing Conditions

This section describes the existing conditions associated with public services, which include fire protection, police protection, schools, libraries, and recreational facilities. It also describes the existing conditions associated with utilities, which include wastewater collection and treatment facilities, stormwater drainage facilities, telecommunications services, electricity and natural gas facilities, and solid waste disposal and recycling facilities.

PUBLIC SERVICES

Fire Protection

Structural and wildfire protection in the San Diego region is the responsibility of fire protection agencies at the federal, state, county, and city levels. Eighteen cities in the San Diego region have a fire department that is responsible for fire protection and prevention within their respective city limits. Fourteen Fire Protection Districts (FPDs), five county Service Areas, and the California Department of Forestry and Fire Protection (CAL FIRE) provide fire and emergency services to unincorporated San Diego County. Volunteer fire protection companies supported by the San Diego County Fire Authority provide emergency services for six areas in the unincorporated county where no fire protection agency is established (see Table 4.15-1 and Table 4.15-2).

CAL FIRE is the principal contractor for fire protection services in San Diego County, and is responsible for wildfire protection of State Responsibility Areas within the county, which comprise over 50% of the unincorporated county's total land area (see Figure 4.19-1 in Section 4.19, "Wildfire"). CAL FIRE operates 18 stations within the county, including one air attack base in Ramona. CAL FIRE also operates an emergency response air program with both aircraft and helicopters, as needed (CAL FIRE 2019). CAL FIRE has established a resource management program to help protect California's natural resources and wildlands. Prevention programs are also run by CAL FIRE, such as vegetation management, risk analysis, and public education (CAL FIRE 2024).

The US Forest Service (USFS) is responsible for fire protection and prevention on federal lands (Federal Responsibility Areas) and private lands within the Cleveland National Forest. There are 12 USFS fire stations in San Diego County. The Department of Defense provides fire protection on military installations but may request assistance from other agencies at the federal, state, or local levels if needed. Tribal governments provide their own fire protection but also may provide mutual air fire services to surrounding areas. Officers with the Harbor Police Department of the San Diego Unified Port District are cross-trained as marine firefighters. Their jurisdiction includes the San Diego Bay, San Diego International Airport, and the tidelands within the cities of San Diego, Chula Vista, National City, Imperial Beach, and Coronado (Hoffman 2018).

Automatic and mutual aid agreements exist between many of the aforementioned agencies to provide necessary support for emergencies. Table 4.15-1 identifies agencies responsible for fire protection in the San Diego region's cities. Table 4.15-2 identifies agencies responsible for providing fire protection in the unincorporated areas of San Diego County. A small portion of the unincorporated county is not served by any FPD. Rather, these areas rely upon neighboring FPDs or CAL FIRE to respond to fires and emergencies. The agency that responds to fires and emergencies in areas not served by any FPD is decided on a case-by-case basis (County of San Diego 2011).

Table 4.15-1 Fire Service Providers in the San Diego Region

The performance of fire protection and emergency services is generally measured with travel or response time standards and service ratios. Travel or response time standards measure the estimated time it will take for responding agency personnel to reach a certain point in their service area from the time of initial call or the time an emergency vehicle begins moving to the emergency location. These standards differ among agencies.

Service ratios are also used to measure the adequacy of service. Service ratio standards typically ensure there are a minimum number of personnel and pieces of equipment to serve a certain population. Water supply and pressure must also be considered when evaluating fire protection services.

Police Protection

The San Diego County Sheriff's Department (SDCSD) is the primary law enforcement body in the San Diego region. SDCSD provides police protection services for the unincorporated areas of the county and the following nine cities: Vista, San Marcos, Santee, Lemon Grove, Imperial Beach, Poway, Encinitas, Del Mar, and Solana Beach. These cities generally provide their own traffic enforcement, while the unincorporated county relies on the California Highway Patrol and SDCSD.

Traffic enforcement, police patrol, and investigative services are provided in the cities of Carlsbad, Chula Vista, Coronado, El Cajon, Escondido, La Mesa, National City, Oceanside, and San Diego by their own city police departments. SDCSD operates several other law enforcement support facilities, including seven detention facilities. These detention facilities provide the services necessary to support a daily average population of more than 5,000 inmates (SDCSD 2024). SDCSD also provides specialized services, such as aerial support, a bomb and arson unit, and a special enforcement detail responsible for highly specialized tactical operations. Forensic services are provided to law enforcement and criminal justice agencies through SDCSD's crime laboratory for all the cities within San Diego County, except for the City of San Diego. Table 4.15-3 shows sworn police protection personnel by jurisdiction in the San Diego region.

Table 4.15-3 Sworn Police Protection Personnel by Jurisdiction in the San Diego Region

Police Protection Providers by Jurisdiction	Number of Sworn Personnel
City of Carlsbad	132
City of Chula Vista	297
City of Coronado	58

Source: City of Carlsbad 2025, City of Chula Vista 2025, City of Coronado 2025, City of El Cajon 2025, City of Escondido 2025, City of Imperial Beach 2025, City of La Mesa 2025, City of Oceanside 2025, City of San Diego 2025, SANDAG 2024.

Local police department staffing goals are set based on different metrics depending on the jurisdiction. For example, some police departments, similar to fire-protection services, evaluate police services based on response times (City of San Diego 2024a). Others follow established staffing guidelines set by organizations like the International Association of Chiefs of Police (IACP 2024) or base staffing on a ratio of police officers to citizens. Response times can vary between service providers and between urban and rural areas. Urbanized areas generally see a much faster response time than rural areas. Response times are also measured against the type of emergency. Calls are generally ranked into different priority levels, where the higher priority call receives a faster response time goal. The lowest priority calls are generally for issues such as animal noise disturbance, while the highest priority calls generally involve more serious crimes. Unlike fire protection emergency responses that are dispatched from a central location, police units respond while on patrol.

Schools

The public school system in the San Diego region has approximately 476,844 students enrolled in kindergarten through 12th (K–12) grade (CDE 2024). There are roughly 44 public school districts with about 740 schools throughout the region, staffed with more than 23,206 teachers. In addition to public primary and secondary schools, the number of charter schools at all grade levels is growing in the San Diego region. Higher education is represented by eight community colleges, three public higher education institutions, and several private higher education schools throughout the region (CDE 2025). Table 4.15-4 identifies K–12 public school districts that provide education at the elementary, middle/intermediate, and high school levels, and their enrollment statistics.

Table 4.15-4 2023-2024 Student Enrollment and Staffing by District in the San Diego Region

Facility planning for public schools is generally based on student generation rates, which vary by jurisdiction and development type. Historical data and future plans for an area are used to project the number of students that will eventually be a part of the community. The generation rates are compared against the current capacity of individual school facilities that would be affected by the growth.

Libraries

The San Diego County Library operates branches in the cities of Del Mar, El Cajon, Encinitas, Imperial Beach, La Mesa, Lemon Grove, Poway, San Marcos, Santee, Solana Beach, and Vista, as well as in the unincorporated areas of the county and operates two bookmobiles. The cities of Carlsbad, Chula Vista, Coronado, Escondido, National City, Oceanside, and San Diego maintain and operate their own library systems. Table 4.15-5 shows the city and county public library systems in the San Diego region. The libraries of California State University, San Marcos; San Diego State University; and UC San Diego are also open to the public, but community members must pay an annual fee in order to check out library resources. The San Diego County Public Law Library (Law Library) is open to the general public, as well as California legal professionals, and provides legal materials and information. The Law Library is funded through the County of San Diego general fund, in addition to a portion of collected court fees. Some libraries have adopted master plans for their system facilities to assess their needs, while others developed service standards, such as square footage of the facility per resident in a defined service area.

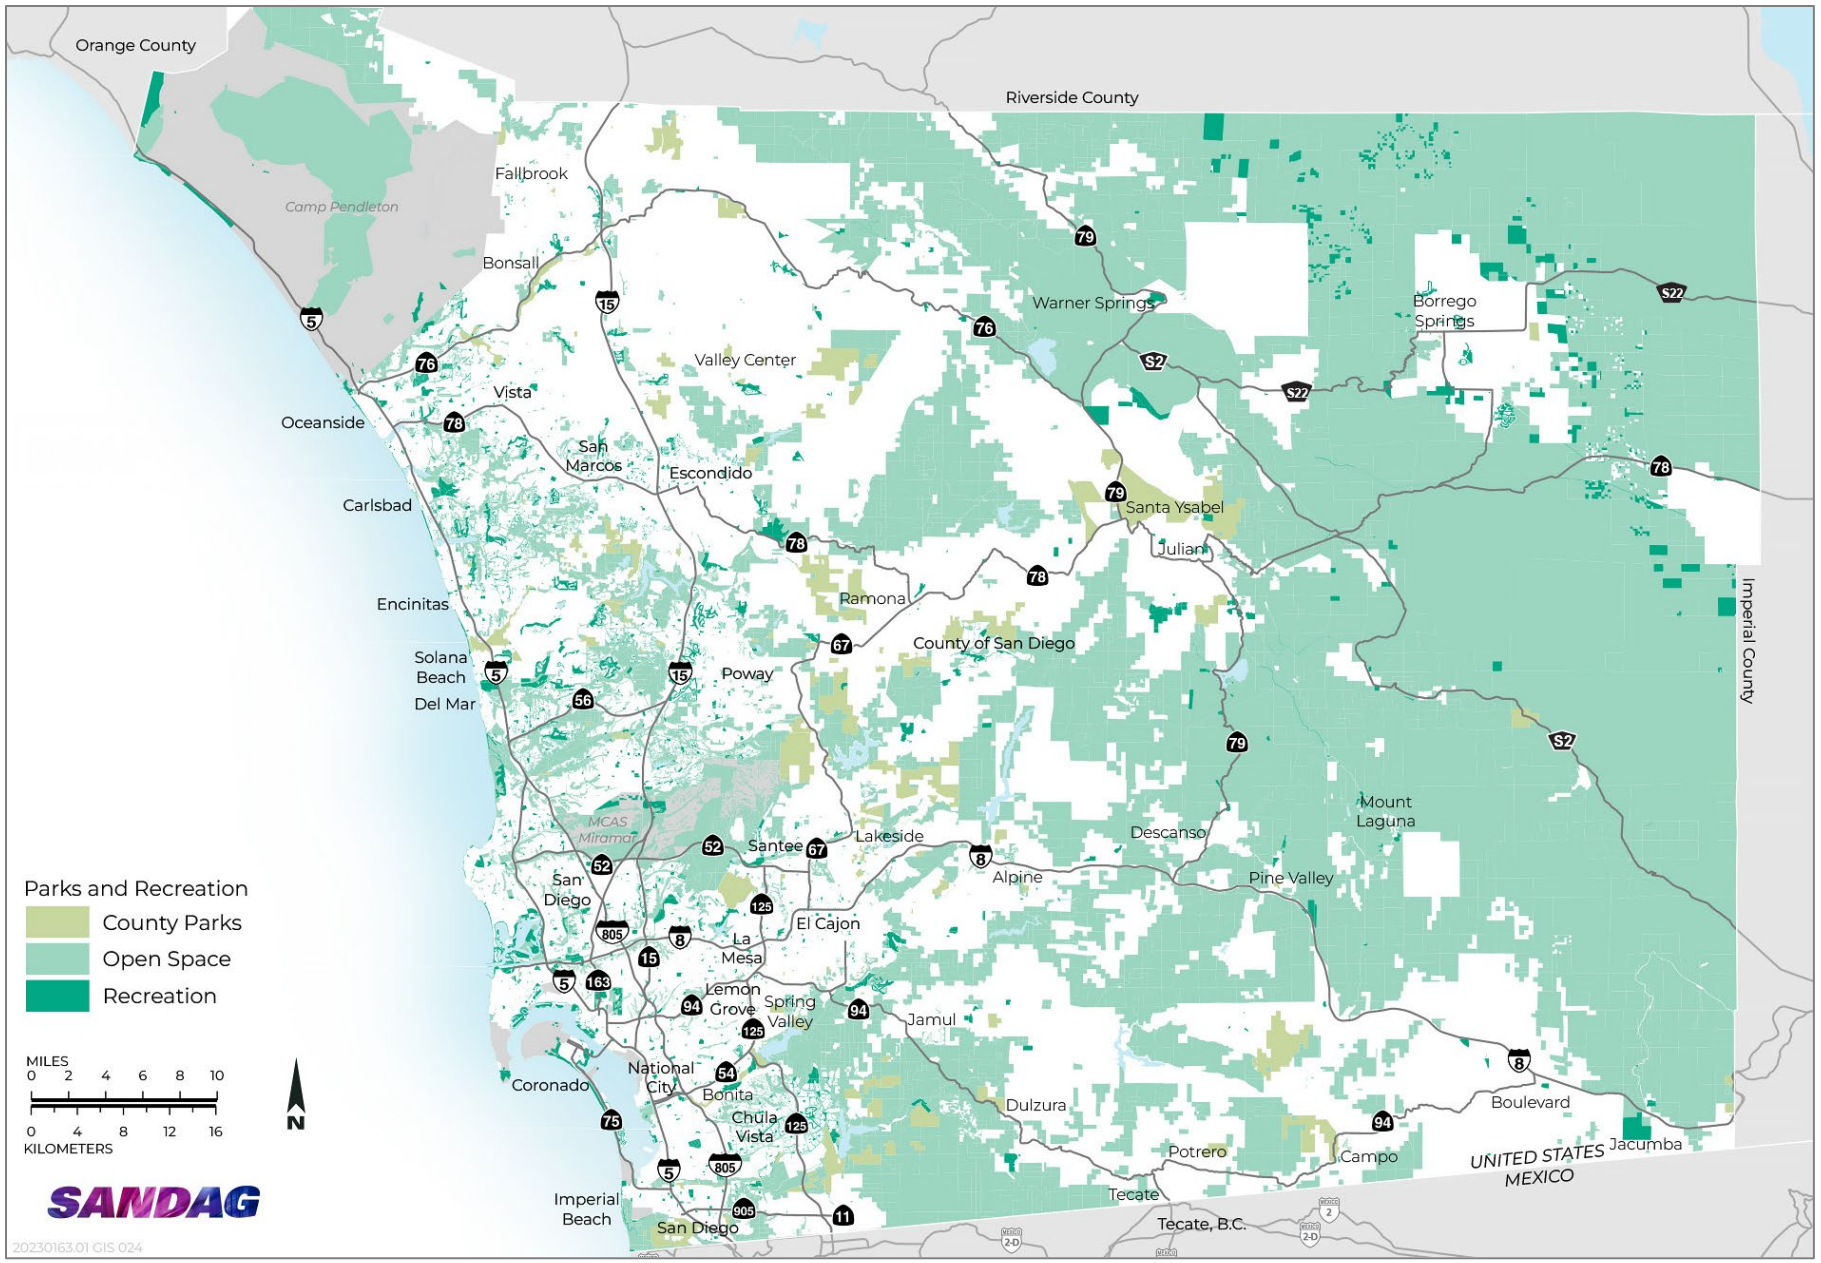
Recreational Facilities

San Diego County has hundreds of designated parks, with uses that include camping parks, preserves, sports parks, beaches, community and teen centers, golf courses/clubhouses, convention centers, marinas, casinos, botanical gardens, landscaped open space, undeveloped natural areas, historic sites, day use parks, racetracks, tourist attractions, and other recreational uses (Figure 4.15-1). As of 2025, these parks and open spaces span more than 1,300,000 acres throughout the San Diego region. Trails and pathways allow for walking, hiking, biking, and horseback riding throughout the region and connect scenic and recreational areas. Trails include the California Coast Trail, which, once completed, will be a 1,200-mile contiguous public right-of-way from the northern to southern border of California to allow for coastal access (California Coastal Conservancy 2019).



Source: Data downloaded from SanGIS in 2025; adapted by Ascent in 2025.

Figure 4.15-1 Open Space Parks and Recreation

Parkland and open space in the San Diego region are owned by federal, state, and local government agencies, as well as tribes, public utilities, private owners, and joint use agreements. Funding for parks comes from their respective owners, as well as tax increment financing, bonds, donations, joint powers authorities, and others. It is also common practice to charge development fees for new development projects to be used to develop parks within that community.

Public parks and recreational facilities can be provided by school districts, community service districts, park and recreation districts, and nonprofit agencies. These facilities include community, senior, and youth centers, sports fields, stadiums, public and private golf courses, visitor centers, amusement parks, fairgrounds, equestrian centers, facilities used for water-oriented recreational purposes, ranches, and private/commercial recreation facilities. Funding for these sites is generally provided by the local jurisdiction.

UTILITIES

Wastewater Collection and Treatment Facilities

The San Diego region is served by over 7,930 miles of pressure and gravity sewer lines, as well as pipes, sewer laterals, and pump stations to move wastewater from its source to a wastewater treatment plant (County of San Diego 2011). The wastewater is generated by a variety of residential, commercial, and industrial actions throughout the region. Table 4.15-6 identifies existing wastewater collection systems in the San Diego region. Wastewater treatment facilities remove solids and contaminants by a variety of methods. The treated wastewater is then released through ocean outfalls, percolation beds, or groundwater recharge. Water reclamation facilities are also used throughout the region and can further treat the water so that it may be used again for agriculture, construction, or other commercial and industrial processes (see Section 4.18). Depending on the process used to treat the biosolids produced during water treatment, the products can be disposed of in designated landfills or municipal solid waste landfills or used to fertilize crops. Table 4.15-7 identifies the capacity of permitted wastewater treatment facilities in the San Diego region.

Most rural areas in San Diego County do not have a sanitary sewer system and must use on site wastewater treatment systems, such as septic tanks. Most commonly, these systems consist of a septic tank connected to a leach line. Septic tanks are discussed further in Section 4.9, "Hazards and Hazardous Materials."

City of San Diego Metropolitan Sewerage System

The Metropolitan Sewerage System, which is owned and operated by the City of San Diego Public Utilities Department's Wastewater Branch, provides regional wastewater treatment services for the city of San Diego and 15 other cities and sanitation districts: Chula Vista, Coronado, Del Mar, El Cajon, Imperial Beach, La Mesa, National City, and Poway; the Lemon Grove Sanitation District; the Padre Dam Municipal and Otay water districts; and the County of San Diego (on behalf of the Winter Gardens Sewer Maintenance District, and the Alpine, Lakeside, and Spring Valley sanitation districts).

The metropolitan sewerage system consists of the Point Loma Wastewater Treatment Plant and Ocean Outfall, the North City Water Reclamation Plant and South Bay Water Reclamation Plant, the Metro Biosolids Center, Environmental Monitoring and Technical Services Laboratory, nine major pump stations, and 75 smaller pump stations (City of San Diego 2024b). The pump stations move wastewater through sewers to the various treatment plants.

The Point Loma Wastewater Treatment Plant treats roughly 175 million gallons of wastewater per day (although it has a maximum capacity of 240 million gallons per day) and discharges it through the Point Loma Ocean Outfall into the Pacific Ocean (City of San Diego 2024b). Any sludge or biosolids accumulated from the processing of the wastewater at this plant are sent to the Metro Biosolids Center for further processing. Up to 30 million gallons of wastewater can be treated per day at the North City Water Reclamation Plant (City of San Diego 2024b). Wastewater from northern San Diego is processed and purified and then redistributed through a reclaimed water pipeline for irrigating, landscaping, and industrial uses. Water processed through the South Bay Water Reclamation Plant can either be discharged into the ocean through the South Bay Ocean Outfall or sent on to tertiary treatment to be used for reclaimed water purposes. The South Bay Water Reclamation Plant has the capacity to process 15 million gallons per day (City of San Diego 2024b).

South Bay International Wastewater Treatment Plant

The International Boundary and Water Commission's Minute No. 283 of July 8, 1990 was approved by both the United States and Mexico, which allowed for the establishment of the Clean Water Partnership binational interagency and authorized the construction of the South Bay International Wastewater Treatment Plant (SBIWTP). The SBIWTP was constructed as a response to untreated wastewater flowing north from Tijuana and polluting the Tijuana River in the United States. The plant provides secondary treatment for 25 million gallons of sewage per day that is then discharged into the Pacific Ocean (IBWC 2024). The treatment plant is located in San Ysidro, about 2 miles west of the point of entry and directly north of Tijuana's main wastewater pumping station.

Storm Water Drainage Facilities

Storm water runoff occurs when precipitation from rain and snowmelt events flows over land or impervious surfaces and does not infiltrate into the ground. This effect is increased by the amount of impervious surfaces (paved streets, parking lots, and building rooftops). In more rural, less developed areas, such as in the unincorporated county, storm water is able to flow into natural drainage sites, such as creeks, streams, or rivers. In urban areas, storm water runoff is collected in a municipal separate storm sewer system (MS4), through a system of conveyances consisting of roads with drainage systems, streets, catch basins, curbs, gutters, ditches, artificial channels, or storm drains. Storm water systems such as these are designed to prevent flooding in urban areas, control erosion, and protect water quality. Section 4.10, "Hydrology and Water Quality," provides analysis of the hydrology and water quality impacts of storm water associated with implementation of the proposed Plan. Each MS4 operator identified in Table 4.15-8 is responsible for operation, maintenance, and management of its own system. MS4s are interconnected, and their operators often share facilities, cooperatively manage systems, and coordinate pollution control efforts.

Source: SWRCB 2015.

Each jurisdiction within the Plan area requires the implementation of storm water pollution prevention techniques, so that conveyance systems are designed to protect surface and ground water quality, as mandated by state and federal regulations. These regulations require a multifaceted approach that involves infrastructure improvements and maintenance; water quality monitoring; source identification of pollutants; land use planning policies and regulations; and pollution prevention activities such as education, code enforcement, outreach, public advocacy, and training, and are explained in more detail in Section 4.15.2, "Regulatory Setting," below.

Electricity and Natural Gas Services

San Diego County is served by San Diego Gas and Electric (SDG&E), which provides electricity and natural gas to more than 3.7 million customers (i.e., 1.4 million accounts) in the county and portions of southern Orange County (SDG&E 2025). The utility has a diverse power production portfolio, composed of a variety of renewable and nonrenewable sources. Energy production typically varies by season and by year. Regional electricity loads also tend to be higher in the summer because the higher summer temperatures drive increased demand for air-conditioning. In contrast, natural gas loads are higher in the winter because the colder temperatures drive increased demand for natural gas heating. See Table 4.15-9 for a summary of electricity and natural gas use within SDG&E service area.

Table 4.15-9 Electricity and Natural Gas Consumption in the SDG&E Service Area in 2022

Sector	Electricity (GWh)	Natural Gas (million therms)
Agriculture and water pump	380	5
Commercial	7,811	175
Industry	1,868	26
Mining and construction	1,513	31
Residential	398	4
Streetlight	5,817	281
Total	79	522

Note: GWh =gigawatt hours.

Telecommunications Services

Telecommunications services—telephone and cellular phone services, cable television, and internet and broadband services in the San Diego region—are provided by a number of privately owned companies.

Telephone and Cellular Phone

Local phone service in the San Diego region is provided primarily by AT&T, which offers traditional landline (copper wire) service as well as digital telephone service. Digital telephone service is offered by a number of other providers, including Cox, Time Warner, Vonage, and a variety of smaller companies. AT&T, Sprint Nextel Corporation, T-Mobile, Verizon Wireless, and Spectrum are some of the cellular telephone providers offering service in the San Diego region. Providers use a combination of underground lines and above ground cellular towers to provide telephone service to the Plan area. Cellular towers are distributed throughout the San Diego region to provide coverage.

Cable Television and Internet

Cable television and internet services are offered by many of the same companies that provide cellular phone service in the area and can be delivered via a number of different technologies, including mobile (cellular), wireless, wireless local area network, and broadband. Table 4.15-10 provides a list of all of the providers in the San Diego region. Fiber optic cables and copper wires are generally collocated with other utility infrastructure, which is usually installed underground within new development in order to reduce visual and safety hazards. With the advent of streaming services, only broadband internet infrastructure is needed to access television service.

Broadband refers to a high-speed internet connection that can transport multiple signals and traffic types. According to the Federal Communications Commission (FCC) (2020), 100% of residents in the San Diego region currently have access to broadband via at least one provider.

Solid Waste Disposal and Recycling Facilities

The County of San Diego is the designated local enforcement agency (LEA) for all solid waste facilities in the region except for facilities within the city of San Diego, which is its own LEA. The LEAs are certified by the California Department of Resources Recycling and Recovery (CalRecycle) and have the responsibility of ensuring that solid waste facilities are operated and closed correctly, and that solid waste is stored and transported properly. LEAs can issue operating permits to facilities, including landfills, transfer stations, material recovery, and composting facilities.

Solid Waste Generation

Solid waste refers to garbage, refuse, and other discarded solid materials that are generated by residential, commercial, and industrial activities. Solid waste is measured in volume and weight, and is classified into one of eight categories: paper, plastics, glass, metals, yard waste, other organics, other wastes, and special wastes. CalRecycle provides specific definitions of these classifications on their website (CalRecycle 2025a). Solid waste generation is measured by disposal and diversion. Disposal is defined in Public Resources Code (PRC) Section 40192 as "the final deposition of solid wastes onto land, into the atmosphere, or into the waters of the state." Diversion includes programs and practices, such as waste prevention and source reduction, recycling, reuse, and composting, that reduce the total amount of waste that requires disposal. Table 4.15-11 shows the 2023 waste generation and disposal rates by jurisdiction.

Table 4.15-11 Total Waste Generation Rates and Annual Disposal Rates by Jurisdiction in the San Diego Region

City	Total Waste Generation (tons)	Annual Disposal Rate (PPD)
City of Carlsbad	137,914	15.9
City of Chula Vista	212,105	19.8
City of Coronado	50,061	27.9
City of El Cajon	97,009	16.6
City of Encinitas	57,770	16.3

City of Solana Beach	16,006	17.1
City of Vista	101,446	20.2
Unincorporated San Diego	515,114	29.4
Total	3,463,408	359.2

Note: PPD = pounds per person per day.

Source: CalRecycle 2023.

Landfills

There are four landfills in the San Diego region, three of which are privately operated and one of which is operated by the City of San Diego. The landfills receive a total daily throughput of approximately 19,750 tons per

day. Together, they have a total remaining capacity of 121,955,024 cubic yards, which is roughly 40% of their total permitted capacity (CalRecycle 2024a). Table 4.15-12 shows the remaining capacity of landfills located in the San Diego region and their estimated closure dates. Marine Corps Base Camp Pendleton operates two additional landfills for its exclusive use that are not included in the table.

Table 4.15-12 Landfills Located in the San Diego Region and Estimated Capacity

Facility	Operator	Solid Waste Information System No.	Throughput (tons/day)	Maximum Permitted Capacity (cubic yards)	Remaining Capacity (cubic yards)	Percent Capacity Remaining	Estimated Closure Date
Borrego Landfill	Borrego Landfill, Inc.	37-AA-0006	50	476,098	88,750	19%	12/31/2046

Collection, Transfer, and Material Recovery Facilities

Solid waste generated from residences and businesses in the San Diego region is collected by private operators, under contract with each of the cities and the county and permitted by the state. The City of San Diego is an exception in the region and operates its own solid waste management system, including solid waste collection. Twenty transfer stations in the region receive solid waste and transfer it into vehicles or containers to be moved to a landfill or transformation facility. There are 14 additional transfer stations that are combined with material recovery facilities (MRFs) that remove recyclables and other valuable materials from the solid waste as it is being processed. A final transfer station also chips and grinds wood waste. MRFs process unseparated trash or separated trash with commingled recyclables. Table 4.15-13 provides a list of transfer facilities and MRFs for the region and their individual daily throughputs.

Table 4.15-13 Transfer/Processing Facilities in the San Diego Region

Facility	Operator	Solid Waste Information System (SWIS) Number	Maximum Permitted Throughput (tons/day)

Source: CalRecycle 2025b.

Recycling, Composting, Chipping, and Grinding

The implementation of recycling, composting, chipping, and grinding practices reduces the amount of material that must be sent to the landfill. There are more than 80 recycling centers in the San Diego region that collect recyclable materials (CalRecycle 2024a). In addition, three composting facilities in the region collect, grind, mix, pile, and add moisture and air to organic materials to speed natural decay and produce a soil amendment, and another four chipping and grinding facilities in the region are designed to reduce the size of compostable material (CalRecycle 2023). One organics processing facility is also permitted in the county (CalRecycle 2023).

Construction and Demolition and Inert Debris Facilities

Construction and demolition (C&D) material and inert debris are solid waste that pose a potential threat to public health and safety and the environment and must be handled differently from municipal solid waste. C&D materials include lumber, drywall, glass, metal, roofing material, tile, carpeting and floor coverings, piping, concrete, cardboard and other packaging materials, dirt, and rock. Of these materials, metals are recycled the most, while lumber is most commonly sent to the landfill. According to the 2021 Disposal Facility-Based Characterization of Solid Waste in California, inert and other materials are estimated to account for 12% of the disposed waste stream in the state, while metal accounts for 5% and glass accounts for 2% (CalRecycle 2024b). There are 17 C&D recyclers in San Diego, 1 large processing facility, 3 medium processing facilities, and 5 inert fill-disposal operations (County of San Diego 2021a). According to CalRecycle, the San Diego region diverted 65,546 tons of C&D debris in 2018 from local landfills (CalRecycle 2018).

4.15.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

Resource Conservation and Recovery Act of 1976

Subtitle C of the Resource Conservation and Recovery Act (RCRA) (42 US Code [USC] 6901 et seq.) gives the US Environmental Protection Agency (EPA) the authority to control hazardous waste from the "cradle-to-grave," and was designed to protect human health and the environment, reduce/eliminate the generation of hazardous waste, and conserve energy and natural resources; to reduce the amount of waste generated; and to ensure that wastes are managed in an environmentally sound manner. RCRA regulates the management of solid waste (e.g., garbage), hazardous waste, and underground storage tanks holding petroleum products or certain chemicals. Solid waste, as defined by RCRA, includes both hazardous and nonhazardous materials. RCRA establishes a framework for the management of nonhazardous waste in Subtitle D. Nonhazardous solid waste includes household garbage, sludge from waste treatment plants, construction debris, and various types of nonhazardous industrial waste. Subtitle D states the requirements for solid waste planning and encourages recycling and recovery programs that most directly affect state and regional solid waste management authorities. EPA also developed federal criteria for the proper design and operation of municipal solid waste landfills and other solid waste disposal facilities. EPA approved the State of California's program, a joint effort of the California Integrated Waste Management Board, the State Water Resources Control Board (SWRCB), the regional water quality control boards (RWQCBs), and LEAs, on October 7, 1993.

US Department of Transportation Act Of 1966, Section 4(f)

Section 4(f) of the US Department of Transportation Act (49 USC Section 303) was enacted to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges, and historic sites. Section 4(f) requires a comprehensive evaluation of all environmental impacts resulting from federal transportation projects administered by the Federal Highway Administration, Federal Transit Administration, and Federal Aviation Administration that involve the use or interference with use of the following types of land:

- public park lands;
- recreation areas;
- wildlife and waterfowl refuges; and
- publicly or privately owned historic properties of federal, state, or local significance.

This evaluation, called the Section 4(f) statement, must be sufficiently detailed to permit the U.S. Secretary of Transportation to determine that:

- there is no feasible and prudent alternative to the use of such land;
- the program includes all possible planning to minimize harm to any park, recreation area, wildlife and waterfowl refuge, or historic site that would result from the use of such lands; or
- if there is a feasible and prudent alternative, a proposed project using Section 4(f) lands cannot be approved by the Secretary of Transportation; or if there is no feasible and prudent alternative, the proposed project must include all possible planning to minimize harm to the affected lands.

Detailed inventories of the locations and likely impacts on resources that fall into the Section 4(f) category are required in project-level environmental assessments.

In August 2005, Section 4(f) was amended to simplify the process for approval of projects that have only minimal impacts on lands affected by Section 4(f). As amended, the US Secretary of Transportation may find such a minimal impact if consultation with the state historic preservation officer results in a determination that a transportation project will have no adverse effect on a historic site or that there will be no historic properties affected by the proposed action. In this instance, analysis of avoidance alternatives is not required, and the Section 4(f) evaluation process is complete.

Clean Water Act

The Clean Water Act (CWA) was established in 1972 and is the basis for regulation of the discharge of pollution into the waters of the United States and regulation of surface water quality standards (33 USC 1251 et seq.). States are required to adopt water quality standards for all surface waters of the United States, as detailed in Section 303. Section 402 of the CWA establishes the National Pollutant Discharge Elimination System (NPDES), which regulates the discharge of pollutants from point sources. Municipal point sources consist primarily of domestic treated sewage and processed water, including municipal sewage treatment plant outfalls and storm water conveyance system outfalls. These outfalls contain pollutants that are emitted into waters of the United States. Without a permit, the discharge of pollutants from point sources into navigable waters of the United States is prohibited. NPDES permits require regular water quality monitoring. For a detailed discussion of the CWA, see the "Regulatory Setting" in Section 4.10, "Hydrology and Water Quality." Storm water and wastewater discharges must meet water quality standards that are established pursuant to the CWA.

National Energy Act of 1978

The National Energy Act of 1978 included the Public Utility Regulatory Policies Act (Public Law 95-617), Energy Tax Act (Public Law 95-318), National Energy Conservation Policy Act (Public Law 95-619), Power Plant and Industrial Fuel Use Act (Public Law 95-620), and the Natural Gas Policy Act (Public Law 95-621).

The intent of the National Energy Act was to promote greater use of renewable energy, provide residential consumers with energy conservation audits to encourage slower growth of electricity demand, and promote fuel efficiency. The Public Utility Regulatory Policies Act created a market for nonutility electric power producers to permit independent power producers to connect to their lines and to pay for the electricity that was delivered.

The Energy Tax Act promoted fuel efficiency and renewable energy through taxes and tax credits. The National Energy Conservation Policy Act requires utilities to provide residential consumers with energy conservation audits and other services to encourage slower growth of electricity demand.

Energy Policy Act of 2005

This comprehensive energy legislation contains several electricity-related provisions that aim to, among other things, help ensure that consumers receive electricity over dependable, modern infrastructure, remove outdated obstacles to investment in electricity transmission lines, make electricity reliability standards mandatory instead of optional, and give federal officials the authority to site new power lines in US Department of Energy–designated national corridors in certain limited circumstances.

Telecommunications Act of 1996

The Telecommunications Act (47 USC Chapter 5) was the first major overhaul of telecommunications law in almost 62 years. The Act deregulates local phone service and allows long-distance carriers and cable television companies to provide local phone services and local telephone companies to provide long distance service. Section 706 of the Act requires that the FCC determine annually whether advanced telecommunications capability is being deployed to all Americans in a reasonable and timely fashion, and assesses the impact of the FCC's policies on broadband deployment.

U.S. Green Building Council's Leadership in Energy and Environmental Design

Leadership in Energy and Environmental Design (LEED) is a nationally recognized certification program administered by the U.S. Green Building Council that promotes sustainable building design, construction, and operation. Projects are rated based on performance in categories such as energy efficiency, water use, materials selection, and indoor environmental quality. LEED encourages voluntary reductions in energy use and greenhouse gas emissions beyond minimum code requirements.

Energy Star Homes

Energy Star is a joint program of the U.S. Environmental Protection Agency (EPA) and the U.S. Department of Energy that certifies new homes meeting strict energy efficiency guidelines. Energy Star homes typically include

high-performance insulation, efficient heating and cooling systems, and energy-efficient appliances, resulting in lower utility costs and reduced environmental impact.

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

California Mutual Aid Plan

The Emergency Managers Mutual Aid (EMMA) system is a collaborated effort between city and county emergency managers in the Office of Emergency Services in the coastal, southern, and inland regions of the state. EMMA provides service in the emergency response and recovery efforts at the Inland Regional Emergency Operations Center, local Emergency Operations Centers, the Disaster Field Office, and community service centers. The purpose of EMMA is to support disaster operations in affected jurisdictions by providing professional emergency management personnel. EMMA operates under the broader framework of California's accordance with the Master Mutual Aid Agreement, which facilitates the sharing of resources among local and state jurisdictions during emergencies. While the Master Mutual Aid Agreement covers all types of emergency assistance, EMMA specifically mobilizes trained emergency management staff to assist with coordination, planning, and operations. Local and state emergency managers have responded in support of each other under a variety of plans and procedures.

Assembly Bill 16, Chapter 33, Statutes of 2002

AB 16 created the Critically Overcrowded School Facilities program to supplement the construction provisions within the School Facilities Program (SFP). The SFP provides state funding assistance for new construction and modernization of facilities. The Critically Overcrowded School Facilities program allows school districts that have been determined by the California Department of Education (CDE) to have critically overcrowded facilities to apply for new construction projects without meeting all SFP program requirements. Districts with SFP new construction eligibility and school sites included on a CDE list of source schools may apply.

Senate Bill 50 — Leroy F Greene Schools Facilities Act of 1998, Chapter 407, Statutes of 1998

SB 50 restricts the ability of local agencies to deny project approvals on the basis that public school facilities (classrooms, auditoriums, etc.) are inadequate. School impact fees are collected at the time building permits are issued. Payment of school fees is required by SB 50 for all new residential development projects and is considered "full and complete mitigation" of any school impacts. School impact fees are payments to offset capital cost impacts associated with new developments, which result primarily from costs of additional facilities, related furnishings and equipment, and projected capital maintenance requirements. As such, agencies cannot require additional mitigation for any school impacts.

Senate Bill 1389, Chapter 568, Statutes of 2002

The California Energy Commission (CEC) is responsible for, among other things, forecasting future energy needs for the state and developing renewable energy resources and alternative renewable energy technologies for buildings, industry, and transportation. SB 1389 requires CEC to prepare an integrated energy policy report every 2 years assessing major energy trends and issues facing the state's electricity, natural gas, and transportation fuel sectors. The report also provides policy recommendations to conserve resources, protect the environment, and ensure reliable, secure, and diverse energy supplies.

The 2023 Integrated Energy Policy Report was adopted in 2024. Energy topics covered in the report include decarbonizing buildings, integrating renewables, energy efficiency, energy equity, integrating renewable energy, updates on Southern California electricity reliability, climate adaptation activities for the energy sector, natural gas assessment, transportation energy demand forecast, and the California Energy Demand Forecast (CEC 2024). The 2025 draft Integrated Energy Policy Report Update will be released in early 2026.

California Building Standards Code (Title 24, California Code of Regulations)

Building Standards Code Title 24 applies to all buildings throughout the State of California and includes requirements for structural, mechanical, electrical, and plumbing systems, and requires measures for energy conservation, green design, construction and maintenance, and fire and life safety and accessibility (24 California

Code of Regulations [CCR]). Cities and counties are required by state law to enforce Title 24; however, they can adopt more restrictive ordinances.
As discussed in Section 4.6, "Energy," as part of the California Building Standards Code, the California Green Standards Code was adopted, which identifies aggressive energy efficiency standards for new residential and non-residential buildings that are continuously updated every few years. Additionally, the California Building Energy Efficiency Standards was adopted, which regulates the energy consumption of new residential and nonresidential buildings in California.

GreenPoint Rated Homes
Administered by Build It Green, the GreenPoint Rated system is California-specific and scores residential buildings based on five environmental categories: energy efficiency, resource conservation, indoor air quality, water conservation, and community impact. The program aligns with California energy codes (Title 24) and provides a flexible yet rigorous rating for new and existing homes.

California Green Builder Program
This voluntary program, developed by the California Building Industry Association, targets builders who exceed Title 24 energy efficiency requirements and incorporate environmentally responsible practices. The program includes standards for energy and water conservation, construction waste recycling, and indoor air quality.

California Rules for Overhead Electrical Line Construction
The Rules for Overhead Electrical Line Construction prescribed by the Public Utilities Commission of the State of California under General Order No. 95 set requirements for overhead line design, construction, and maintenance. The rules were last updated in December 2024.

California Government Code Sections 4216–4216.9, Protection of Underground Infrastructure
California Government Code Sections 4216 through 4216.9 require an excavator to notify appropriate known operators of subsurface installations within the delineated boundaries of a proposed area of excavation.

Community Facilities Act of 1982 and Amendments
The Community Facilities Act of 1982 (Government Code Section 53324), also commonly known as the Mello-Roos Act, enables certain public agencies to designate a Mello-Roos Community Facilities District, which allows for the financing of public improvements and services. These include basic infrastructure, police protection, fire protection, ambulance services, schools, parks, libraries, museums, and other cultural facilities. Mello-Roos Community Facilities Districts are usually created to finance improvements and services when no other funding sources are available and require a two-thirds majority vote of residents living within the proposed boundaries. They are used especially often (but not exclusively) in new development areas. Upon approval, a special tax lien is placed against each property in the district, and residents pay a special tax each year. This tax is not based on property value, but on formulas that consider physical characteristics, such as square footage and structure size.

Quimby Act and AB 1359
Cities and counties have been authorized since the passage of the 1975 Quimby Act (Government Code Section 66477) to pass ordinances requiring that developers set aside land, donate conservation easements, or pay fees for park improvements. Revenues generated through the Quimby Act cannot be used for the operation and maintenance of park facilities. The dedicated land or fees may only be used for the development or rehabilitation of neighborhood or community parks or recreational facilities in the subdivision they were provided for, according to AB 1359 (Chapter 412, Statutes of 2013), unless certain requirements are met and an exception is made. The goal of the Quimby Act is to require developers to help mitigate the impacts of property improvements. The act gives authority for passage of land dedication ordinances only to cities and counties. Special districts must work with cities or counties to receive parkland dedication or in-lieu fees. The fees must be paid and land conveyed directly to the local public agencies that provide park and recreation services communitywide.

California Coastal Act, Coastal Recreation Policies

California Coastal Act policies related to coastal recreation include PRC Section 30210, which requires that maximum access and recreational opportunities shall be provided for all people, and Section 30213, which protects lower-cost visitor and recreational facilities, and encourages the provision of public recreational opportunities.

Subdivision Map Act of 1974

One of the powers granted to local jurisdictions by the Subdivision Map Act (Government Code Section 66410 et seq.) is the authority to impose drainage improvements or drainage fees and assessments. Specifically, local jurisdictions may require the provision of drainage facilities, proper grading and erosion control, dedication of land for drainage easements, or payment of fees needed for construction of drainage improvements. The types and applicable standards of the improvements may be specified in the local ordinance.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Water Code, Division 7) regulates activities and factors that may affect the quality of the waters of the State of California, to protect the health, safety, and welfare of the people. It charges the state with the act of protecting the waters from degradation and established nine RWQCBs throughout the state. The act declares that SWRCB and each RWQCB will have the primary responsibility for water quality control. Each RWQCB is in charge of updating their water quality control plans, known as basin plans. They also regulate pollutant or nuisance discharges that may affect surface or groundwater. Storm water and wastewater discharges must meet water quality standards that are established in basin plans. The Water Quality Control Plan for the San Diego Basin, also known as the Basin Plan, establishes water quality objectives and implementation strategies to protect the beneficial uses of water bodies in the San Diego region and describes monitoring plans to assess its effectiveness (RWQCB 2016). Beneficial uses are defined as "the uses of water necessary for the survival and well-being of man, plants, and wildlife," and promote the economic, social, and environmental goals of humankind. Policies in the Basin Plan define treatment levels of water that must be met by regional wastewater facilities.

State Water Resources Control Board and RWQCBs

The SWRCB issues individual and general NPDES permits for wastewater and storm water through authorization of the EPA. Discharges that may impact surface or groundwater, and which are not regulated by an NPDES permit, are issued a waste discharge requirement (WDR) that serves as a permit under the authority of the California Water Code. The RWQCBs issue Land Disposal WDRs that permit certain solid and liquid waste discharges to land to ensure that wastes do not reach surface water or groundwater. Land Disposal WDRs contain requirements for liners, covers, monitoring, cleanup, and closure. The RWQCBs also permit certain point source discharges of waste to land that have the potential to affect surface or groundwater quality. This category of discharges, known as "Non-15" WDR, is the most diverse and includes sewage sludge and biosolids, industrial wastewater from power plants, wastes from water supply treatment plants, treated wastewater for aquifer storage and recovery, treated groundwater from cleanup sites, and many others.

Related to wastewater collection and treatment facilities, storm water drainage facilities, and landfills, the SWRCB has issued the following orders:

- Caltrans NPDES Permit (Order 99-06-DWQ): Requires Caltrans to regulate nonpoint source discharge from its properties, facilities, and activities. Among other requirements, Caltrans must annually update an enforceable Storm Water Management Plan. See Section 4.10, Hydrology, for more detail.
- Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Order No. 2006-0003-DWQ): Requires all federal and State agencies, municipalities, counties, districts, and other public entities that own, operate, or are otherwise responsible for sanitary sewer systems greater than 1 mile in length that collect and/or convey untreated wastewater to a publicly owned treatment facility in California to prepare sewer system management plans and report all sanitary sewer overflows (SSOs) to the SWRCB. Order No. WQ 2008-0002-EXEC amended the statewide Monitoring and Reporting Program for SSOs that reach surface waters or

storm drains. The RWQCB issued Order No. R9-2007-0005 to reaffirm the prohibition of SSOs upstream of a wastewater treatment facility.

Water Quality Control Policy for Siting, Design, Operation and Maintenance of Onsite Wastewater Treatment System (CCR Title 23)

AB 885 (Chapter 781, Statutes of 2000) required that the SWRCB, along with other interested parties, adopt specified regulations or standards for the permitting and operation of prescribed onsite wastewater treatment systems (OWTS). Each RWQCB must incorporate the new standards and regulations into their regional water quality control plans. Resolution R9-2015-0008, adopted in April 2015, incorporated the OWTS policy into the San Diego Water Quality Control Plan, and Resolution No. 2018-0019 amended the Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems (the "OWTS Policy") in CCR Title 23 (SWRCB 2018). On site wastewater treatment systems allow habitation in locations that are far from central wastewater treatment plants, such as areas of the unincorporated County. OWTS can help to reduce the strain on municipal wastewater facilities and reduce the need for construction of new facilities in these remote areas. The OWTS policy helps to reduce an OWTS' impact on the environment where they are used.

San Diego Regional Municipal Storm Water Permit

An MS4 is defined as a conveyance or system of conveyances (e.g., municipal streets, catch basins, gutters, storm drains, etc.) used for collecting or conveying storm water that is not a combined sewer or connected to a publicly owned treatment network. The San Diego Municipal Storm Water Permit (Order R9-2013-0001) (as amended by Order Nos. R9-2015-0001 and R9-2015-0100) (Municipal Permit) regulates the conditions under which storm water and non-storm water discharges into and from MS4s are prohibited or limited (RWQCB 2018). The 18 cities, County government, San Diego County Regional Airport Authority, San Diego Unified Port District, Del Mar Fairgrounds, and the University of California, San Diego each owns or operates an MS4, through which it discharges storm water and non–storm water into waters of the United States within the San Diego region. These entities are the San Diego County Copermittees (Copermittees) who, along with the Orange County Copermittees, are subject to the requirements of the permit. The Caltrans storm water system is regulated separately under the Caltrans NPDES permit.

This permit requires each of the Copermittees to prepare a Jurisdictional Urban Runoff Management Program (JURMP) to control the contribution of pollutants to and the discharges from the MS4. Each of these JURMPs includes a component addressing construction activities, development planning, and existing development. The goal of the jurisdictional runoff management programs is to implement water quality improvement strategies and runoff management programs that effectively prohibit non-stormwater discharges into the Copermittees' MS4s and reduce pollutants in stormwater discharges from the Copermittees' MS4s to the maximum extent practicable. The MS4 permit, required by NPDES, requires the development of a hydromodification management plan (HMP). Pursuant to RWQCB Order 2007-0001, provision D.1.g, HMPs shall be prepared with the purpose of managing increases in runoff discharge rates and durations from specific projects. Regulations require site design to account for hydrology and drainage studies are required for projects with significant increases in impervious surfaces. Projects are discouraged from diverting or increasing flows that cross a site. Larger projects (those with 50 acres of disturbance or greater) are subject to hydromodification requirements and must develop a project-level HMP.

In accordance with the provisions of the Municipal Permit, the County of San Diego developed the *County of San Diego BMP Design Manual* (County of San Diego 2020a). The *County of San Diego BMP Design Manual* establishes a series of source control, site design, and treatment control best management practices (BMPs) that are to be implemented by all priority development projects (PDPs). PDPs include new development; redevelopment projects that create, add, or replace 5,000 square feet; and pollutant-generating projects. A PDP should refer to the local agency that has jurisdiction for the project for guidance on the source control, site design, and treatment control BMPs for stormwater pollutants. All future projects implementing the proposed Plan must adhere to these regulations.

AB 341

Legislation enacted in 2011 (AB 341, Chesbro, Chapter 476, Public Resources Code Section 42926[a]) made a legislative declaration that it is the policy goal of the State of California that not less than 75% of solid waste generated be source reduced, recycled, or composted by the year 2020. AB 341 also requires the provision of recycling service to commercial facilities that generate 4 cubic yards or more of solid waste per week and to multifamily facilities with five or more units.

Integrated Waste Management Act of 1989 (AB 939) and SB 1016

AB 939 (Chapter 1095, Statutes of 1989) requires each city and county in California to develop integrated waste management plans (IWMPs) to divert 25% of its waste stream by 1995 and 50% by 2000, with the base year set as 1990. The goal of AB 939 is to reduce dependence on landfills for waste disposal. The act established a hierarchy of priority for waste management: (1) source reduction (waste prevention), to reduce the amount of waste generated at its source; (2) recycling (or reuse) and composting; (3) transformation; and (4) disposal by landfilling. See below for a discussion of the IWMP for the San Diego region.

The passage of SB 1016 amended AB 939 to modernize how waste diversion is measured and enforced. Rather than relying solely on estimated diversion percentages, SB 1016 introduced a per capita disposal measurement system and evaluates how much waste is disposed of per person per day in each jurisdiction. This approach provides a more consistent and performance-based metric for assessing local waste reduction progress.

AB 1826

AB 1826 Chesbro (Chapter 727, Statutes of 2014) requires businesses, including state agencies, to recycle their organic waste on and after April 1, 2016, depending on the amount of organic waste they generate per week. Organic waste means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste. For businesses that generate 8 or more cubic yards of organic waste per week, this requirement began on April 1, 2016, while those that generate 4 cubic yards of organic waste per week must have had an organic waste recycling program in place beginning January 1, 2017. The requirement becomes more stringent in the following years. Multifamily properties are regulated but are only required to divert green waste and nonhazardous wood waste. This law also requires local jurisdictions across the state to implement an organic waste recycling program to divert organic waste generated by businesses, including certain multifamily residential dwellings, as described above, starting on January 1, 2016. In September 2020, CalRecycle extended the organic waste recycling requirements to businesses that generate 2 cubic yards or more of commercial solid waste (total trash, recyclables, and organics) per week.

AB 2396

As of January 1, 2017, pursuant to AB 2396 (McCarty, Chapter 466, Statutes of 2016), each state agency is required to include in its existing annual report to CalRecycle specified information on the state agency's compliance with mandatory commercial recycling requirements, pursuant to AB 341, and mandatory commercial organics recycling requirements, pursuant to AB 1826.

AB 2812

Effective July 1, 2018, pursuant to AB 2812 (Gordon, Chapter 530, Statutes of 2016), state agencies must provide adequate recycling and organics recycling containers to collect waste generated. Containers should be placed adjacent to trash containers and be visible, easily accessible, and clearly marked.

CalRecycle Regulations

CalRecycle regulations pertaining to nonhazardous waste management in California include minimum standards for solid waste handling and disposal; regulatory requirements for composting operations; standards for handling and disposal of asbestos-containing waste; resource conservation programs; enforcement of solid waste standards and administration of solid waste facility permits; permitting of waste tire facilities and waste tire hauler registration; special waste standards; used oil recycling program; electronic waste recovery and recycling; planning

guidelines and procedures for preparing, revising, and amending countywide IWMPs; and solid waste cleanup program (14 CCR Division 7).

CALGreen Construction Waste Diversion

The California Green Building Standards Code (CALGreen) (24 CCR Part 11) mandates locally permitted new residential and nonresidential building construction, demolition and certain additions and alteration projects to recycle or salvage for reuse a minimum 65% of the nonhazardous construction and demolition waste or meet a local C&D waste management ordinance, whichever is more stringent.

Caltrans Highway Design Manual

The Caltrans *Highway Design Manual* was developed to be a set of policies and procedures to carry out the highway design functions of Caltrans. While this manual does not instate a legal standard, it does provide guidance and uniform standards related to design and construction of Caltrans facilities. These standards include consideration of runoff and controlling it through hydraulic design of drainage features (Caltrans 2020).

California Code of Regulations

Title 5, Division 10

Division 10 of Title 5 of the CCR governs all aspects of education within the state.

Title 8, Sections 1270 and 6773

In accordance with the CCR, Title 8, Sections 1270, "Fire Prevention," and 6773, "Fire Protection and Fire Equipment," the California Occupational Safety and Health Administration has established minimum standards for fire suppression and emergency medical services. The standards consist of, but are not limited to, guidelines on the handling of highly combustible materials, fire hosing sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

Title 13, Division 2

Division 2 of Title 13 of the CCR governs the operations of California Highway Patrol.

Title 22, Division 4

Wastewater reclamation in California is regulated under CCR Title 22, Division 4. The intent of these regulations is to ensure protection of public health associated with the use of reclaimed water. The regulations establish acceptable levels of constituents in reclaimed water for a range of uses and prescribe means for assurance of reliability in the production of reclaimed water. The State Water Resources Control Board, Division of Drinking Water (formerly under the Department of Health Services) has jurisdiction over the distribution of reclaimed wastewater and the enforcement of Title 22 regulations. The applicable RWQCB is responsible for issuing waste discharge requirements (including discharge prohibitions, monitoring, and reporting programs).

REGIONAL LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

County of San Diego Fire Protection Ordinance No. 10172

The Fire Protection Ordinance No. 10172 ratified the 2011 Consolidated Fire Code for the 16 FPDs in the unincorporated county. Each FPD can modify the code based on specific needs for their jurisdiction. The County Fire Code applies to both ministerial and discretionary projects and both new and repair projects. The County Fire Code is amended every 3 years in conjunction with the revised California Building Standards Code.

County of San Diego Sewer System Management Plan

The County of San Diego developed a sewer system management plan (SSMP) to document management of their wastewater collection system (County of San Diego 2015). The SSMP provides a summary of the action plan

implemented to comply with the sanitary sewer system requirements imposed by the WDRs and other governing agencies. It includes a description of the activities and procedures that personnel follow to implement the various programs encompassed in the overall efforts to efficiently manage, operate, and maintain the sanitary sewer system and facilitate the reduction and potential elimination of SSOs. The goals of the SSMP include the following:

- minimizing the frequency and impact of SSOs
- effectively and efficiently mitigating the impacts of SSOs should they occur
- providing adequate sewer capacity to convey peak flows
- maintaining and improving the condition of the collection system infrastructure to provide continual reliable service
- engaging and educating the public regarding programs and issues related to the wastewater collection system.

San Diego Integrated Waste Management Plan

The County of San Diego prepares the IWMP for the San Diego region. The IWMP includes the following elements: Source Reduction and Recycling, Household Hazardous Waste, Non-Disposal Facility, and Countywide Siting. The Countywide Siting Element must demonstrate at least 15 years of remaining disposal capacity. It includes various strategies to demonstrate the remaining capacity, such as existing, proposed, and tentative landfills or landfill expansions; increased diversion efforts; and the export of solid waste disposal. In the San Diego region, the Countywide Siting Element must be updated every 5 years and must be adopted by the County Board of Supervisors and a majority of the cities within San Diego County. A 5-year review of the Countywide IWMP was completed in 2022, which determined that updates to the Countywide Summary Plan or the Countywide Siting Element planning documents were not warranted (County of San Diego 2022). Under the law, SANDAG is designated as the region's Integrated Waste Management Local Task Force responsible for advising and assisting the cities and County with certain aspects of compliance with AB 939, discussed above.

California PRC, Sections 41730 et seq. require every California city and county to prepare and adopt a Non-Disposal Facility Element for all new non-disposal facilities, and any expansions of existing non-disposal facilities, that will be needed to implement local Source Reduction and Recycling Elements (SRREs). A non-disposal facility is defined as any solid waste facility required to obtain a state solid waste facility permit, except a disposal facility or a transformation facility (PRC Section 40151). The April 2025 update describes the current non-disposal facility system of the unincorporated San Diego County consisting of MRF's, transfer stations, rural transfer stations, organic processors and construction, demolition and inert processing recycling facilities.

Solid Waste Reduction Plans

A number of jurisdictions within the San Diego region have developed solid waste reduction plans that designate waste reduction targets. For example, the City of San Diego Environmental Services Department has developed a zero-waste plan for the City of San Diego that is designed to divert waste from landfill disposal. The plan calls for 75% diversion by 2020 and 90% diversion by 2035, and for zero waste to be disposed of in landfills by 2040 (City of San Diego 2015). One of the goals of the plan is to promote local policies and ordinances as well as legislation at the state level that encourages manufacturers, consumers, and waste producers to be responsible for waste. The County of San Diego developed a strategic plan to reduce waste (County of San Diego 2017), with approved updates to the Non-Exclusive Franchise Agreement for Discarded Materials Management and Solid Waste Ordinance, which will help the County achieve its sustainability goals of progressively diverting solid waste from landfills and achieving an 80% waste diversion by 2030, and align with state laws, AB 1826 and SB 1383 (County of San Diego 2020b, County of San Diego 2021b). The County updated its Solid Waste Ordinance in 2021 as a response to the state's updated waste diversion goals, such as the AB 1826 regulations. Other jurisdictions, such as the City of Encinitas, have incorporated goals to develop waste reduction strategies into climate action plans (City of Encinitas 2024). In response to CALGreen C&D diversion mandates, local jurisdictions have also adopted C&D ordinances.

County and City General Plans

The County and cities' general plans establish policies for a number of topics relevant to public services and utilities, including fire prevention, law enforcement, schools, libraries, parks and recreational facilities, solid waste, storm water, and sewer infrastructure. General plan policies related to public services and utilities include implementation of funding and management strategies for public infrastructure projects, and planning policies to identify demand for new facilities and their design and construction. Policies related to police and fire-rescue can include identification of response times or other staffing goals, and characterization of standards for facilities and equipment. Beyond its General Plan, the County has developed a Community Trails Master Plan and implements its Parkland Dedication Ordinance (Chapter 1, Sections 810.101 et seq.) to plan for and fund park and recreation expansions in conjunction with population growth (County of San Diego 2021c). Other jurisdictions in the county have also conducted master planning to identify future park and recreation needs and expansion opportunities. In 2017, the California Governor's Office of Planning and Research completed the first comprehensive update to the General Plan Guidelines since 2003 (LCI 2017). The Governor's Office of Planning and Research was renamed the Governor's Office of Land Use and Climate Innovation effective July 1, 2024, under SB 164. One of the major changes includes an expanded section addressing the need for additional recycling, anaerobic digestion, composting, and remanufacturing facilities in the land use element of general plans.

Standard Urban Storm Water Mitigation Plan

Standard Urban Stormwater Mitigation Plan (SUSMP) requirements, which focused on project design requirements and related post-construction requirements, not on the construction process itself, in the San Diego region have been phased out and replaced by updated stormwater design standards. As of February 26, 2016, the County of San Diego requires new development projects to comply with its BMP Design Manual, which aligns with the Regional MS4 Permit (Order No. R9-2013-0001, as amended).

Hydromodification Management Plan

To address the effects of increased runoff from new development on stream channel stability and water quality, the County of San Diego developed a Hydromodification Management Plan (HMP) in compliance with San Diego RWQCB Order R9-2007-0001. The HMP applies to Priority Development Projects and establishes performance standards to manage changes in runoff flow rates and durations that could lead to erosion, sediment pollution, or degradation of stream habitat. The County of San Diego, along with other Copermittees, was required to implement the HMP by January 14, 2011, and to integrate its provisions into its Standard Urban Stormwater Mitigation Plan (SUSMP) for local compliance.

Low Impact Development Handbook

In 2014, the County of San Diego Department of Public Works published its Low Impact Development (LID) Handbook to provide technical guidance for implementing post-construction stormwater management consistent with the Regional MS4 Permit and the County's BMP Design Manual. The LID Handbook establishes a design hierarchy emphasizing runoff prevention and on-site management through distributed stormwater controls. The handbook assists project applicants, planners, and engineers in meeting hydromodification and water quality standards by integrating LID principles into site planning, thereby protecting downstream waters and reducing infrastructure strain.

4.15.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts in the form of initial study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the checklist questions that address the criteria in Appendix G. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR and the unique characteristics of the proposed Plan.

Checklist questions for public services and utilities are included in three sections of the CEQA Guidelines Appendix G checklist: Public Services (XIV), Recreation (VXI), and Utilities and Service Systems (XIX). For purposes of this EIR, the Appendix G questions have been combined and modified. Specifically, Appendix G Section XV, Public Services, question (a), and Section XVI, Recreation, question (b) have been combined into PS-1. Section XVI, Recreation, question (a) is included as REC-1. Section XIX, Utilities and Service Systems, questions (a) and (c) are combined in U-1. Section XIX, Utilities and Service Systems, questions (d) and (e) are combined in U-2. Section XIX, Utilities and Service Systems, question (b) is included in Section 4.18, "Water Supply."

Implementation of the proposed Plan would have a significant public services and utilities impact if it would:

- **PS-1.** Result in substantial adverse physical impacts associated with the provision of or need for new or physically altered (i.e., expanded) public facilities, in order to maintain adequate fire and police protection, emergency services, schools, libraries, and recreation facilities.
- **REC-1.** Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.
- **U-1.** Result in the expansion, relocation, or construction of wastewater collection and treatment, storm water drainage, electric power, natural gas, or telecommunications facilities to adequately meet projected capacity needs, the construction of which could cause significant environmental impacts.
- **U-2.** Generate solid waste in excess of state or local standards or in excess of the capacity of local infrastructure; impair the attainment of solid waste reduction goals; or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

The analysis discloses impacts to public services, recreation, and utilities. There is insufficient evidence to support a meaningful analysis of how the proposed Plan's public services, recreation, and utilities impacts would be worsened by climate change. Therefore, a climate change analysis for public services, recreation, and utilities impacts is not included in this section.

4.15.4 Environmental Impacts and Mitigation Measures

PS-1 RESULT IN SUBSTANTIAL ADVERSE PHYSICAL IMPACTS ASSOCIATED WITH THE PROVISION OF OR NEED FOR NEW OR PHYSICALLY ALTERED (I.E., EXPANDED) PUBLIC FACILITIES, IN ORDER TO MAINTAIN ADEQUATE FIRE AND POLICE PROTECTION, EMERGENCY SERVICES, SCHOOLS, LIBRARIES, AND RECREATION FACILITIES.

Analysis Methodology

This section analyzes impacts associated with the provision of or need for new or physically altered public facilities in order to maintain adequate public services under the proposed Plan. To maintain adequate service levels, facilities may need to expand and implement improvements to accommodate increased demand and comply with the County of San Diego's General Plan facilities standards (County of San Diego 2011). A significant impact would occur if forecasted regional growth and land use change or planned transportation network improvements required construction or expansion of facilities to maintain adequate levels of service for fire and police protection, emergency services, schools, libraries, and recreation facilities that would result in adverse physical impacts. Impacts of construction activities for new or expanded facilities are analyzed as well. Additional information about impacts on fire protection related to wildfire is included in Section 4.19, "Wildfire."

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035

regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. In these cities, higher levels of public services would be needed, while demand for public services would increase throughout the region in response to forecasted growth and increased risk from wildfires, as discussed in Section 4.19. In areas of job or housing growth, new or expanded facilities, such as police and fire stations, would be needed to protect the new infrastructure and population, while the increased population in developed areas would require both new facilities and physical expansion of existing facilities. Where growth occurs outside of existing service areas, response times to those areas would be longer and would be out of compliance with service standards unless new or expanded facilities are constructed.

According to forecasted population and housing unit growth, by 2035, schools, libraries, and recreational facilities would also experience facility deficiencies and would require new or expanded facilities to maintain current levels of service as the population increases. As the population grows, use of these facilities would increase. Schools and libraries may become overcrowded, and recreation areas may become overused and degraded if no new or expanded facilities are constructed. As a result, these facilities would not meet the County of San Diego's standard to maintain adequate service levels (County of San Diego 2011). The need for these facilities would be concentrated in residential areas because demand for these public services is driven by population growth, while demand for fire and police protection facilities and emergency services is created by both residential and nonresidential land use types.

Throughout the San Diego region, the construction of new public facilities or expansion of existing public facilities would likely be needed to maintain existing (2025) service levels for fire protection, police protection, emergency services, schools, libraries, and recreational facilities in the year 2035. Individual service providers are responsible for identifying service deficiencies based upon their adopted performance measures or services standards for determining the adequacy of existing public services and deciding when and where to expand existing facilities or provide new facilities to maintain adequate public services. Payment of school fees, as required by SB 50 for all new residential projects, would fully mitigate school impacts for a portion of the population and housing growth projected in 2035, but new or expanded schools still may be needed. Other public facilities or expansions are funded through Facilities Benefit Assessment fees, Development Impact Fees, Mello Roos fees, and other public funding mechanisms assessed at the time development projects are approved.

The provision of new facilities or expansion of existing governmental facilities would result in short-term construction-related impacts and long-term operational impacts, for resource areas such as air quality, noise, and traffic, among others. Construction-related and long-term operational impacts are typically controllable and avoided or substantially lessened by mitigation measures adopted by the implementing agency, including adherence to existing regulations and BMPs. Because details are not known about timing, location, and other project-specific information for new or expanded facilities, it cannot be guaranteed that impacts from the construction and operation of new or physically altered governmental facilities would be less than significant for all projects. Therefore, regional growth and land use change would result in a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR 75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

New transportation network improvements and programs, such as additions to existing highways, rail corridors, or local roads located in established communities, would generally require little to no increase in police and fire protection and emergency services, and would not cause deterioration of the facilities that provide police, fire, and emergency services compared to existing (2025) conditions. Construction of transportation network improvements would maintain emergency access to construction work sites and businesses, schools, hospitals, and medical facilities near construction sites. All construction activities, including roadway closures, would be coordinated with police, fire protection, and emergency services to prevent service delays or disruptions. The operation of the transportation network improvements and programs would not increase use of fire, emergency, or police services due to increased accidents, injuries, or collisions, because improvements would be required to conform to the design standards of the public agency responsible for implementation in order to minimize hazardous conflicts and conditions that could contribute to collisions and other safety hazards, as discussed in additional detail in Section 4.16, "Transportation." Transit service expansions would introduce new facilities, such as stations and Park & Ride facilities, which would require police, fire, and emergency service protection; however, the proposed Plan would not significantly affect response times or exceed the capacity of the local service providers. The project, by itself, would not preclude the need to improve public facilities from meeting their service goals and would not require the construction of new or expanded public facilities. Therefore, the need for fire, emergency, and police services and facilities would not substantially increase as a result of planned transportation network improvements and programs.

As a result, the construction and operation of transportation network improvements would require minor or no use of public services or facilities. Demand for public services and facilities is typically driven by new population, housing, and job growth as described above, and not by transportation network improvements or programs. Therefore, the construction and operation of transportation improvements and programs would not increase demand for schools, libraries, or recreational facilities such that new or physically altered facilities would be required in order to maintain adequate levels of service.

Between 2022 and 2035, additional transportation network improvements and programs are proposed in areas throughout the region that are currently served by different public service providers. However, as described above, none of the proposed transportation network improvements and programs would create new demand for public services beyond the level of demand created by new regional growth. Similarly, the transportation network improvements or programs would not create new demand for police or fire protection because that demand is driven by regional growth rather than transportation network improvements. Therefore, transportation network improvements and programs would have a less than significant impact.

2035 Conclusion

Implementation of regional growth and land use changes, but not transportation network improvements and programs, would result in substantial adverse physical impacts associated with the construction of new or expanded public facilities. Therefore, this impact (PS-1) in the year 2035 is significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. In these cities, higher levels of public services would be needed, while demand for public services would increase throughout the region in response to forecasted growth and increased risk from wildfires, as discussed in Section 4.19, "Wildfire."

While some areas would experience a higher percent increase than others, there would be additional demand for public services throughout the region. In areas of new growth, where development is expanding into previously

undeveloped or rural land, existing infrastructure may not have been designed to meet the increased demand associated with population growth. In these areas, new facilities, such as police and fire stations, would be needed to protect the new infrastructure and population, while the increased population in developed areas would require both new facilities and physical expansion of existing facilities. Where growth occurs outside of existing service areas, response times to those areas would be longer and would be out of compliance with service standards unless new or expanded facilities are constructed.

The provision of new facilities or expansion of existing governmental facilities would result in short-term construction-related impacts and long-term operational impacts on resource areas such as air quality, noise, and traffic, among others. Construction-related and long-term operational impacts are typically controllable and avoided or substantially lessened by mitigation measures adopted by the implementing agency, including adherence to existing regulations and BMPs. Because details are not known about timing, location, and other project-specific information for new or expanded facilities, it cannot be guaranteed that impacts from the construction and operation of new or physically altered governmental facilities would be less than significant for all projects. Therefore, regional growth and land use change would result in a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period.

Between 2036 and 2050, additional transportation network improvements and programs are proposed in areas throughout the region that are currently served by different public service providers. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion. However, as is true in the 2035 analyses, none of the proposed transportation network improvements and programs would create new demand for public services beyond the level of demand created by new regional growth that would require new or physically altered (i.e., expanded) governmental facilities. Therefore, transportation network improvements and programs would have a less than significant impact.

2050 Conclusion

Implementation of regional growth and land use change, but not transportation network improvements and programs, would result in substantial adverse physical impacts associated with the construction of new or expanded public facilities. Therefore, this impact (PS-1) in the year 2050 is significant.

MITIGATION MEASURES

PS-1 RESULT IN SUBSTANTIAL ADVERSE PHYSICAL IMPACTS ASSOCIATED WITH THE PROVISION OF OR NEED FOR NEW OR PHYSICALLY ALTERED (I.E., EXPANDED) PUBLIC FACILITIES, IN ORDER TO MAINTAIN ADEQUATE FIRE AND POLICE PROTECTION, EMERGENCY SERVICES, SCHOOLS, LIBRARIES, AND RECREATION FACILITIES.

2035, 2050

PS-1 Implement Mitigation Measures for New/Expanded Public Service Facilities.

During planning, design, and project-level CEQA review of development of public facilities projects, the County of San Diego, cities, and other public service providers can and should implement mitigation measures to avoid or reduce significant environmental impacts associated with the construction of new or expanded public facilities. Mitigation measures should be implemented by public service providers directly responsible for the construction or expansion activities. Significant environmental impacts requiring mitigation may be identified in the following issue areas: agricultural and forestry resources; air quality; biological resources; cultural resources, greenhouse gas emissions; hydrology and water quality; noise and vibration; geology, soils, and paleontological resources;

transportation; tribal cultural resources; and water supply. Mitigation measures may be similar to those described in this EIR for construction of development projects and transportation network improvements.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of the proposed Plan would result in significant impacts associated with the construction or expansion of public facilities by 2035 and 2050 in order to maintain necessary service ratios and performance standards. Mitigation measure PS-1 would reduce the impacts of project-specific construction or expansion through project-level planning, design, and CEQA mitigation measures. However, it cannot be guaranteed that all future project-level impacts can be mitigated to a less-than-significant level. Therefore, this impact (PS-1) would remain significant and unavoidable.

REC-1 INCREASE THE USE OF EXISTING NEIGHBORHOOD AND REGIONAL PARKS OR OTHER RECREATIONAL FACILITIES SUCH THAT SUBSTANTIAL PHYSICAL DETERIORATION OF THE FACILITY WOULD OCCUR OR BE ACCELERATED.

Analysis Methodology

This section analyzes impacts associated with an increase in the use of parks and recreational facilities that would cause accelerated substantial deterioration under the proposed Plan. A significant impact would occur if forecasted regional growth and land use change or planned transportation network improvements and programs resulted in increased use of parks or other recreational facilities, in a manner that would result in or accelerate substantial physical deterioration of those facilities. To evaluate potential impacts, areas where regional growth and land use change are expected to occur and locations of planned transportation projects in 2035 and 2050 are compared to the 2022 baseline existing open space park lands (i.e., conserved lands) and recreational lands (i.e., parks) identified in Section 4.15.1, "Existing Conditions," to determine if implementation of the proposed Plan would accelerate or result in substantial physical deterioration of parks or other facilities.

Physical deterioration is likely to occur when parks and recreation facilities are overused. Overuse would likely result when a greater number of people are using the same number of parks and recreational facilities leading to the accelerated deterioration of existing facilities. Physical deterioration would also occur without the acquisition of new parks and recreational facilities or increased maintenance of existing parks and facilities or a decrease in land dedicated to open space or parkland use. However, local jurisdictions have the means to acquire, develop, and maintain parkland and recreation facilities in the future through the funding mechanisms described in Section 4.15.2, and through the laws, regulations, and local plans described in this section. Local jurisdictions have authority to acquire land or collect in-lieu fees to avoid a reduction in park acreage per capita pursuant to the Quimby Act (Government Code Section 66477).

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

In each of the communities where growth would occur, park and recreation facilities would experience an increase in their use, which would accelerate the deterioration of the existing facilities. In addition, approximately 1,777 acres of open space parks and 160 acres of recreation lands would be displaced by development in various locations throughout the region as a result of 2035 regional growth and land use change (Figure 4.15-2). Park and recreation facility expansions would offset these impacts; however, communities throughout the region may not be able to keep up with the demand for park and recreational facilities proportionate to the projected increase in population demand. Compliance with the Quimby Act would require developers to set aside land, donate conservation easements, or pay fees for park improvements, which would partially offset the projected impacts because compliance with the Quimby Act does not fully mitigate all park and recreation impacts from new development. However, there is no assurance that future park and recreation facilities would be capable of adequately serving forecasted populations, and a physical deterioration of park and recreation facilities may occur or be accelerated by 2035. Therefore, this is a significant impact.

Transportation Network Improvements and Programs

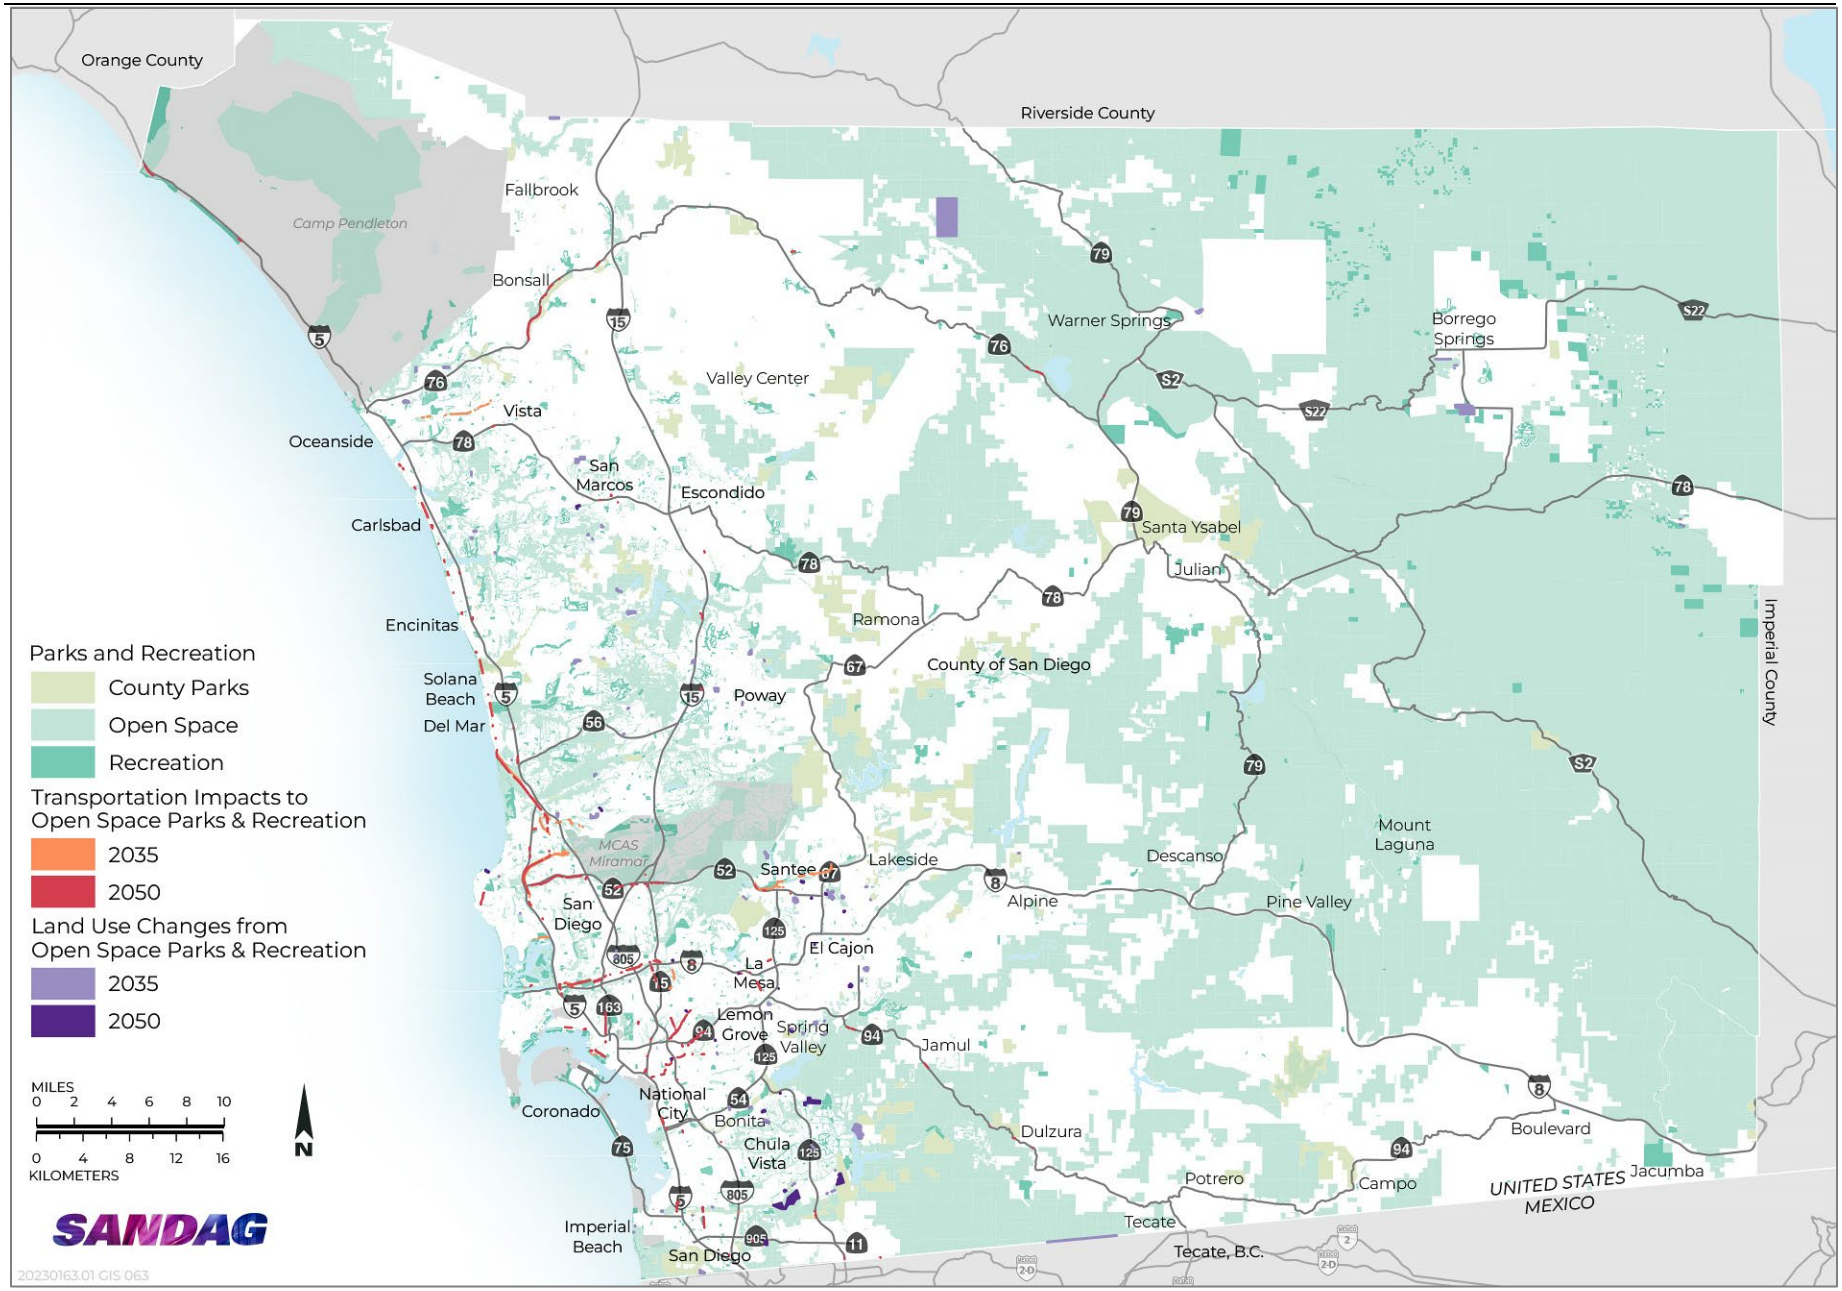
Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR 75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

None of the transportation network improvements and programs proposed to be implemented by 2035 would create new demand for park and recreation facilities beyond the level of demand created by new regional growth, except where expanded transit would result in a minor redistribution of trips and increases in recreational facility usage near transit stations or stops. However, construction of transportation network improvements such as facility widenings may require the temporary closure or rerouting of bicycle facilities. All bike lane or path closures would be properly noticed and safely detoured.

Ultimately, active transportation improvements implemented by 2035 would expand recreation opportunities such as bicycle facilities in the region, resulting in adverse physical impacts. The future transportation network improvements implemented between 2025 and 2035 would directly remove 68 acres of open space parks and 26 acres of recreation lands (Figure 4.15-2). Therefore, transportation network improvements would not lead to a substantial increased demand on existing recreational facilities but would expand active transportation facilities and remove an additional 94 acres of land designated for such uses, putting more pressure on existing facilities and contributing to their physical deterioration given there would be no assurance that future park and recreation facilities would expand to offset the acreage removals. Therefore, this is a significant impact.

2035 Conclusion

Implementation of regional growth and land use changes by 2035 would result in increased demand for recreation facilities leading to accelerated deterioration, while regional growth and transportation network improvements combined would contribute to the expansion of active recreation facilities and the physical removal of 2,031 acres of open space park and recreation lands by 2035. Collectively, these impacts would result in the substantial physical deterioration of existing park and recreation facilities. Therefore, this impact (REC-1) in the year 2035 is significant.



Source: Data downloaded from SanGIS in 2025; adapted by Ascent in 2025.

Figure 4.15-2 Impacts to Recreational Facilities

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. In each of the communities where growth would occur, park and recreation facilities would experience an increase in use, which would accelerate the deterioration of the existing facilities. In addition, approximately 346 additional acres of open space parks and 65 additional acres of recreation lands would be directly removed by development in various locations throughout the region as a result of regional growth and land use change between 2036 and 2050 (Figure 4.15-2). When combined with the conversion of open space parks and recreation lands by 2035, a total removal of 2,123 acres of open space parks and 225 acres of recreation lands would be expected by 2050 under the proposed Plan. Recreation facility expansions would offset these impacts; however, communities throughout the region may not be able to keep up with the demand for park and recreational facilities proportionate to the projected increase in population demand. Compliance with the Quimby Act would require developers set aside land, donate conservation easements, or pay fees for park improvements, which would partially offset the projected impacts because compliance with the Quimby Act does not fully mitigate all park and recreation impacts from new development. However, there is no assurance that future park and recreation facilities would be capable of adequately serving forecasted populations, and a physical deterioration of park and recreation facilities may occur or be accelerated by 2050. Therefore, this is a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Between 2036 and 2050, additional transportation network improvements and programs are proposed in areas throughout the region. Most of the transportation network improvements would affect existing transportation facilities, such as Blue, Orange, and Green Trolley line rail grade separations; additional Managed Lanes along existing freeways and highways; improvements to regional arterials; and active transportation projects. Other planned transportation network improvements including COASTER commuter train lines 582, and 398 extensions, Streetcar Light Rail lines, and the SPRINTER extension would require acquisition of new rights-of-way.

However, as is true in the analyses above, none of the proposed 2050 transportation network improvements and programs would create new demand for park and recreation facilities beyond the level of demand created by new regional growth, with the exception of the minor redistribution of trips that may lead to increased usage of recreation facilities near transit stations and stops. Construction of the transportation network improvements, such as facility widening, may also require the temporary closure or rerouting of bicycle facilities. All bike lane or path closures would be properly noticed and safely detoured. In addition, active transportation improvements would expand recreation opportunities, such as bicycle facilities, in the region resulting in adverse physical impacts. However, the future transportation network improvements would displace 67 additional acres of open space parks and 40 additional acres of recreation lands, which, when added to the removal impacts occurring by 2035, result in a total removal of 135 acres of open space parks and 66 acres of recreation lands by 2050 (Figure 4.15-2).

Therefore, transportation network improvements would not lead to the increased use of recreational facilities but would result in the construction of new active transportation facilities and would remove land designated for such uses, putting more pressure on existing facilities and contributing to their physical deterioration given there would be no assurance that future park and recreation facilities would expand to offset the acreage removals. Therefore, this would be a significant impact by 2050.

2050 Conclusion

Implementation of regional growth and land use changes by 2050 would result in increased demand for recreation facilities leading to accelerated deterioration, while regional growth and transportation network improvements combined would contribute to the expansion of active recreation facilities and the physical removal of an additional 518 acres of open space park and recreation lands by 2050. Collectively, these impacts would result in the substantial physical deterioration of existing park and recreation facilities. Therefore, this impact (REC-1) in the year 2050 would be significant.

MITIGATION MEASURES

REC-1 INCREASE THE USE OF EXISTING NEIGHBORHOOD AND REGIONAL PARKS OR OTHER RECREATIONAL FACILITIES SUCH THAT SUBSTANTIAL PHYSICAL DETERIORATION OF THE FACILITY WOULD OCCUR OR BE ACCELERATED.

2035, 2050

REC-1 Implement Mitigation Measures for Parks and other Recreational Facilities.

During planning, design, and project-level CEQA review of development projects and transportation network improvements and programs, the County of San Diego, cities, other public service providers, and other transportation project sponsors can and should, and SANDAG shall, implement mitigation measures to avoid or reduce substantial physical deterioration of parks or other recreational facilities. Mitigation measures could include expanding or improving existing recreation facilities to accommodate additional use or building new recreation facilities.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of mitigation measure REC-1 would reduce impacts related to the adverse physical impacts of facility expansions and deterioration of existing parkland and recreational facilities in 2035 and 2050, but not to a less-than-significant level. Local jurisdictions with inadequate parkland per capita would use state regulations and local plans and ordinances to acquire land and funding for the provision of new parkland as population growth occurs. However, it cannot be assured that adequate financial resources would be available to acquire the amount of parkland needed to meet forecasted population growth and offset losses that would occur a result of regional growth, land use changes, and transportation improvements. Therefore, this impact (REC-1) would remain significant and unavoidable.

U-1 RESULT IN THE EXPANSION, RELOCATION, OR CONSTRUCTION OF WASTEWATER COLLECTION AND TREATMENT, STORM WATER DRAINAGE, ELECTRIC POWER, NATURAL GAS, OR TELECOMMUNICATIONS FACILITIES TO ADEQUATELY MEET PROJECTED CAPACITY NEEDS, THE CONSTRUCTION OF WHICH COULD CAUSE SIGNIFICANT ENVIRONMENTAL IMPACTS.

Analysis Methodology

This section analyzes impacts associated with the provision of or need for new or physically altered utilities facilities to maintain adequate services under the proposed Plan (aside from water supply facilities, which are evaluated separately in Section 4.18, "Water Supply"). A significant impact would occur if forecasted regional

growth and land use change or planned transportation network improvements and programs required construction, expansion, or relocation of utilities facilities that would result in adverse physical impacts.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. In these cities, higher demand for new utility infrastructure, upgraded systems or expansions would occur, while demand for utilities would also increase throughout the region in response to forecasted growth. In general, however, regional growth and land use change in urban areas would have less demand on utilities than in more rural areas that are not currently served by utility infrastructure because urban areas tend to have established utility infrastructure that can be more readily adapted to changes such as regional growth.

While population growth would result in an increase in the amount of wastewater generated, especially in the cities of San Diego, San Marcos, and Oceanside, the service providers responsible for operating the existing wastewater treatment plants outlined in Table 4.15-7 would have to maintain sufficient conveyance and treatment capacity to serve forecasted growth through 2035 in accordance with approved wastewater discharge requirements filed with SWRCB and local health ordinances. Development in existing communities would require expansion or upsizing of existing collection and treatment systems, while development in new areas would require installation of new collection and treatment systems. Development in rural residential areas would also require on-site wastewater treatment facilities, such as septic tanks.

Similarly, storm water drainage improvements would need to be constructed to serve new development and redeveloped areas to accommodate forecasted growth through 2035. Increases in impervious surfaces would increase storm water runoff, which would increase the volume or velocity of storm water flows, leading to flooding, scouring, erosion, and other drainage pattern alterations. Therefore, regional growth and land use change that results from implementation of the proposed Plan in 2035 would require the construction of new or expanded storm water drainage facilities to ensure adequate capacity for the conveyance of storm water. Development associated with the proposed Plan would have to comply with all existing regulations pertaining to drainage patterns (i.e., the local SUSMP and HMP). The storm water regulations include the requirement that post project storm water flows match the preproject flows for PDPs. When there is an increase in impervious area, this requirement would generally be achieved through the implementation of the appropriate BMPs described in the local SUSMP and HMP, and the *County Low Impact Development (LID) Handbook*. LID is an integrated site design methodology that uses small-scale detention and retention to minimize pollutants conveyed by runoff and to mimic pre project site hydrological conditions (County of San Diego Department of Public Works 2014). Furthermore, drainage systems would be upgraded and increased in size in areas determined by each MS4 operator to have inadequate conveyance capacity relative to new impervious surface to reduce impacts related to storm water runoff through their SUSMP or JURMP. Hydrologic impacts resulting from construction would be primarily addressed through compliance with the Construction General Permit as discussed in Section 4.10, "Hydrology and Water Quality."

Regional growth and land use change would increase demand for energy resources and require electricity or natural gas infrastructure relocations or improvements to serve development through 2035. As described in Section 4.6, "Energy," projected growth would trigger the need for new or expanded energy facilities, including power plants, distributed generation, electrical transmission and distribution infrastructure, and natural gas

facilities (e.g., storage, pipelines). Construction and operation of the facilities would have a range of impacts depending on the facility type, size, and location. Forecasted regional growth and land use change would primarily occur in or adjacent to areas that are already developed and that have electricity and natural gas infrastructure in place. Although this would reduce the need for construction of new facilities in other areas, the increases in demand for electricity and natural gas would result in upgrades of transmission lines, substations, and distribution and related facilities that already serve these areas to ensure that energy infrastructure adequately meets future needs. Telecommunications systems would also need to be constructed to serve new development and redeveloped areas associated with forecasted population growth and land use change through 2035. Demand for telecommunication infrastructure would require the construction of broadband cable lines, telephone lines, cellular towers, and other transmission devices. Similar to other utility infrastructure, development in existing communities would require expansion or upsizing of existing systems, while development in new areas would require installation of new systems.

Forecasted growth in 2035 in accordance with the proposed Plan would trigger the need for new or expanded wastewater treatment facilities and collection systems, storm water conveyance and treatment BMPs, electrical and natural gas facilities, and telecommunications infrastructure, which would result in short-term construction-related impacts and long-term operational impacts on resources such as air quality, noise, traffic, and water quality, among others. WDRs and existing regulations, as further described in Section 4.10, "Hydrology and Water Quality" would reduce water quality impacts of future utility construction projects. Construction-related and long-term operational impacts are typically controllable and avoided or substantially lessened by mitigation measures adopted by the implementing agency, including adherence to existing regulations and BMPs, such as those issued and enforced through SWRCB and the RWQCB. Because details are not known about timing, location, and other project-specific information for provision of new, relocated, or expanded utility systems, it cannot be guaranteed that impacts from the construction and operation of new or expanded facilities and collection systems would be less than significant for all projects. Therefore, regional growth and land use change would cause a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR 75, improvements to corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

While most of the transportation improvements (e.g., highway, arterial, transit, and active transportation) would occur in already urbanized areas, some improvements would require new connections and expansions of utility infrastructure and convert vacant land to impervious surfaces, resulting in increased storm water flow volume and/or velocity. As described in the "Regulatory Setting" section in Section 4.10, "Hydrology and Water Quality," engineering standards, including the Caltrans *Highway Design Manual* and county requirements, would be followed for properly controlling and conveying surface runoff and surface waters when drainage modifications are necessary for project implementation. In addition, requirements in the Municipal Storm Water Permit (Order R9-2013-0001) require that PDPs maintain pre project hydrology under postconstruction operation. This means that additional runoff volumes and peak flow discharges from new impervious areas must be attenuated to pre project levels in order to maintain hydrological conditions and not exceed storm water conveyance capacities. One of the methods for achieving this is through the implementation of the LID, as discussed above.

However, new or expanded storm water drainage facilities would be required to support the transportation network improvements by the year 2035, and any increase in the volume of storm water generated would require storm water drainage facilities with sufficient capacity downstream in channels and other drainage outlets.

Additionally, changes to drainage patterns due to transportation improvements, as further discussed under Impact HWQ-2 in Section 4.10, would necessitate the construction of storm water drainage facilities in new places where the infrastructure has not been established to meet these needs.

A number of the transportation network improvements would require relocated or new electrical or natural gas infrastructure, such as the supporting infrastructure to the Complete Corridors (i.e., enhance connectivity, including managed lanes, connectors and direct access ramps for managed lanes, transportation technology and Smart Intersection Systems (SIS), and goods movement to be implemented on freeways, highways, and rural corridors), Flexible Fleets (i.e., regional rail; light rail; streetcar; a variety of bus options, including Rapid, express, local, local circulator, rural; and an Airport Transit Connection), and various transit station improvements, such as communications equipment, signalizing systems, and security lighting. The proposed Plan would also increase the number of electric vehicles throughout the region. Construction impacts associated with the installation of electricity and natural gas connections or the relocation of existing lines are expected to be confined to trenching within rights-of-way in order to place the lines below surface. Electrical and natural gas facilities required for the planned transportation network improvements would be constructed as part of the various network improvements. Because the demand for electrical energy and natural gas associated with the transportation network improvements in the proposed Plan would be a small fraction of the regional use, new energy facilities would not be necessary beyond the infrastructure needs associated with regional growth and land use change.

The provision of new, relocated, or expanded utility infrastructure in conjunction with the transportation network improvements in the proposed Plan in 2035 would result in short-term construction related impacts and long-term operational impacts on such resource areas as biological resources, cultural resources, and water quality, among others. These impacts would be anticipated as a result of storm water and drainage infrastructure put in place as part of the transportation network improvements. It is not anticipated that wastewater conveyance and treatment or telecommunication systems would need to be installed or expanded to serve the 2035 transportation network. A number of the transportation network improvements would require relocated or new electrical or natural gas infrastructure, such as transit station improvements. Construction-related and long-term operational impacts are typically controllable and avoided or substantially lessened by mitigation measures adopted by the implementing agency, including adherence to existing regulations and installation of BMPs. In addition, road improvement projects included in the project, such as La Media Road Improvements or Discovery Street Improvements, have included design components of utilities and drainages to meet capacity needs as result of the project. Because most details are not known about timing, location, and other project specific information for provision of new, relocated or expanded utility systems, it cannot be guaranteed that impacts from the construction and operation of such facilities would be less than significant for individual improvements. Therefore, transportation network improvements and programs would cause a less-than-significant impact on the demand for wastewater, electrical, natural gas, and telecommunications infrastructure and a significant impact related to storm water drainage facilities.

2035 Conclusion

Implementation of regional growth and land use change would result in substantial adverse physical impacts associated with the construction and operation of new, relocated or expanded utility infrastructure for wastewater, storm drain, electrical, natural gas, and telecommunications systems. Transportation network improvements and programs would cause a less-than-significant impact on wastewater, electrical, natural gas, and telecommunications infrastructure and a significant impact related to storm water drainage facilities. Therefore, the impact (U-1) by the year 2035 would be significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego

(51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. In these cities, higher demand for new utility infrastructure, upgraded systems, or expansions would occur, while demand for utilities would also increase throughout the region in response to forecasted growth. In general, however, regional growth and land use change in urban areas would have less demand on utilities than in more rural areas that are not currently served by utility infrastructure.

Similar to impacts in the 2035 scenario, 2050 forecasted growth in accordance with the proposed Plan would trigger the need for new or expanded wastewater treatment facilities and collection systems, storm water conveyance and treatment BMPs, energy (i.e., electrical and natural gas) facilities, and telecommunications infrastructure, which would result in short-term construction-related impacts and long-term operational impacts on such resource areas as air quality, noise, traffic, and water quality, among others. WDRs and existing regulations, as further described in Section 4.10, "Hydrology and Water Quality," would reduce water quality impacts of future utility construction projects. Construction-related and long-term operational impacts are typically controllable and avoided or substantially reduced by mitigation measures adopted by the implementing agency, including adherence to existing regulations and BMPs, such as those issued and enforced through SWRCB and the RWQCB. Because details are not known about timing, location, and other project-specific information for provision of new or expanded utility systems, it cannot be guaranteed that impacts from the construction and operation of new or expanded facilities and collection systems would be less than significant for all projects. Therefore, regional growth and land use change would cause a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

The provision of new or expanded utility infrastructure from 2036 to 2050, in particular storm water drainage associated with the transportation network improvements in the proposed Plan, would result in short-term construction-related impacts and long-term operational impacts on such resource areas as biological resources, cultural resources, and water quality, among others. These impacts would be anticipated as a result of storm water and drainage infrastructure put in place as part of the transportation network improvements. It is not anticipated that wastewater conveyance and treatment or telecommunication systems would need to be installed or expanded to serve the 2050 transportation network. As in the 2035 analysis, construction-related and long-term operational impacts are typically controllable and avoided or substantially reduced by mitigation measures adopted by the implementing agency, including adherence to existing regulations and installation of BMPs. Because details are not known about timing, location, and other project-specific information for provision of new or expanded utility systems, it cannot be guaranteed that impacts from the construction and operation of such facilities would be less than significant for all projects. Therefore, transportation network improvements and programs would cause a less-than-significant impact on wastewater, electricity, natural gas, and telecommunications infrastructure and a significant impact related to storm water drainage facilities.

2050 Conclusion

Implementation of regional growth and land use change by 2050 would result in substantial adverse physical impacts associated with the construction and operation of new or expanded utility infrastructure for wastewater, storm drain, and telecommunications systems. Transportation network improvements and programs would cause a less-than-significant impact on wastewater, electricity, natural gas, and telecommunications infrastructure and a significant impact related to storm water drainage facilities. Therefore, the impact (U-1) by the year 2050 would be significant.

MITIGATION MEASURES

U-1 RESULT IN THE EXPANSION, RELOCATION, OR CONSTRUCTION OF WASTEWATER COLLECTION AND TREATMENT, STORM WATER DRAINAGE, ELECTRIC POWER, NATURAL GAS, OR TELECOMMUNICATIONS FACILITIES TO ADEQUATELY MEET PROJECTED CAPACITY NEEDS, THE CONSTRUCTION OF WHICH COULD CAUSE SIGNIFICANT ENVIRONMENTAL IMPACTS.

2035, 2050

U-1a Implement Mitigation Measures for New/Expanded Wastewater, Storm Water, Electrical, Natural Gas, and Telecommunications Facilities Associated with Development Projects.

During planning, design, and project-level CEQA review of development projects, the County of San Diego, cities, and other wastewater, storm water, and telecommunications management agencies can and should apply necessary mitigation measures to avoid or reduce significant environmental impacts associated with the construction or expansion of new or expanded facilities. Mitigation measures should be implemented by utilities management agencies directly responsible for the approval and construction of new or expanded facilities. Significant environmental impacts requiring mitigation may be identified in the following resource areas: air quality; biological resources; cultural resources; energy; greenhouse gas emissions; hydrology and water quality; noise and vibration; geology, soils, and paleontological resources; transportation; tribal cultural resources; and water supply. Mitigation measures may be similar to those described in this EIR for construction of development projects.

U-1b Implement Mitigation Measures for New/Expanded Storm Water Facilities Associated with Transportation Network Improvements.

During planning, design, and project-level CEQA review of transportation network improvements, SANDAG shall, and other transportation project sponsors can and should, be required to implement storm water BMPs during planning, design, project-level CEQA review, and project construction. Measures include, but are not limited to, implementation and construction of sand filters, bio strips, bioswales, detention basins, storage vaults, and infiltration basins, which would reduce pollutant runoff into the storm drain system.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of the proposed Plan would result in significant impacts associated with the construction or expansion of utility systems and facilities in 2035 and 2050 in order to serve areas where population growth and transportation network improvements are located. Mitigation measures U-1a and U-1b would reduce the impacts of project-specific construction or expansion through project-level planning, design, and CEQA mitigation measures. However, it cannot be guaranteed that all future project-level impacts can be mitigated to a less-than-significant level. Therefore, the impact (U-1) would remain significant and unavoidable.

U-2 GENERATE SOLID WASTE IN EXCESS OF STATE OR LOCAL STANDARDS OR IN EXCESS OF THE CAPACITY OF LOCAL INFRASTRUCTURE; IMPAIR THE ATTAINMENT OF SOLID WASTE REDUCTION GOALS; OR FAIL TO COMPLY WITH FEDERAL, STATE, AND LOCAL MANAGEMENT AND REDUCTION STATUTES AND REGULATIONS RELATED TO SOLID WASTE.

Analysis Methodology

This section analyzes whether the generation of solid waste associated with implementation of the proposed Plan would exceed the capacity of local infrastructure and services or fail to comply with statutes and regulations related to solid waste. A significant impact would occur if forecasted regional growth and land use change or planned transportation network improvements and programs either result in generation of solid waste that exceeded the capacity of landfills or caused a failure to comply with federal, State, or local goals or standards,

which include demonstrating at least 15 years of remaining disposal capacity in landfills and diverting an increasing percentage of waste streams over time (County of San Diego 2011). To evaluate potential impacts, expected increases in solid waste generation are compared to available permitted landfill capacity and applicable standards, waste reduction goals, and management statutes.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Regional growth forecasted to occur between 2022 and 2035 would produce both C&D debris and municipal solid waste during operations. It is anticipated that the majority of construction-phase C&D debris would likely be diverted, while lower diversion rates are expected during operation of new developments. Existing programs, policies, and practices in place throughout the region would continue to reduce the rate of solid waste generation (amount per person or per employee) and divert a percentage of solid waste from landfills to recycling facilities. By 2035, Borrego Landfill and Sycamore Landfill would be the only permitted landfills with remaining disposal capacity as they are estimated to reach capacity and close by the years 2046 and 2042, respectively (CalRecycle 2024a). With the projected closure of the Miramar Landfill and Otay Landfill before 2035, the County and City could still demonstrate it has more than 15 years of permitted landfill capacity at the other facilities as required by the State's Integrated Waste Management Act. However, there may not be sufficient landfill capacity in the region to accommodate forecasted regional growth through 2035. As a result, despite waste management plans in place throughout the region focused on diverting an increasing percentage of waste from landfills, forecasted regional growth would generate solid waste at a level that would likely exceed the capacity of permitted solid waste disposal facilities in the region,. Regional growth and land use change would have a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR 75, improvements to corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Construction of transportation network improvements that would be implemented by the year 2035 would primarily generate C&D debris and a minimal amount of municipal solid waste (i.e., associated with construction workforce and transit station operations) While much of the C&D debris materials would be processed and diverted from landfills in accordance with recycling programs and policies, small quantities of municipal solid waste produced from these construction projects would end up in landfills. The need to dispose of waste as part of the transportation network improvements would contribute to reduced capacity of landfills in the region, which may not be sufficient to accommodate the region's waste disposal needs by 2035 because the landfill's capacity may not be able to sustain the amount of solid waste disposal generated by projects under the Plan. Therefore, transportation network improvements would generate solid waste at a level that would likely exceed the capacity

of permitted solid waste disposal facilities in the region and would require new or expanded solid waste disposal facilities. Transportation network improvements and programs would have a significant impact.

2035 Conclusion

Implementation of regional growth and land use change and transportation network improvements and programs in the proposed Plan by 2035 would generate solid waste and C&D debris that may not be accommodated by the regional landfills. Although the forecasted growth and network improvements would comply with programs, policies, and practices to reduce the rate of solid waste generation, this impact (U-2) in the year 2035 would be significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. Regional growth forecasted to occur between 2036 and 2050 would produce both C&D debris and municipal solid waste during operations. It is anticipated that the majority of construction-phase C&D debris would likely be diverted, while lower diversion rates are expected during operation of new developments. Existing programs, policies, and practices in place throughout the region would continue to reduce the rate of solid waste generation (amount per person or per employee) and divert a percentage of solid waste from landfills to recycling facilities. However, all of the currently permitted landfills would be closed before 2050, and the County and cities would have to expand the permitted landfill capacities within their jurisdictions to demonstrate they have more than 15 years of permitted landfill capacity, as required by the State's Integrated Waste Management Act (CalRecycle 2024a). Because there may not be sufficient landfill capacity in the region to accommodate forecasted regional growth through 2050, forecasted regional growth would generate solid waste at a level that would exceed the capacity of permitted solid waste disposal facilities in the region, even with waste reduction measures in place. Regional growth and land use change would have a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Construction of transportation network improvements that would be implemented by the year 2050 would primarily generate C&D debris and a minimal amount of municipal solid waste (i.e., associated with construction workforce and transit station operations) While much of the C&D debris materials would be processed and diverted from landfills in accordance with recycling programs and policies, small quantities of municipal solid waste that would be produced from these construction projects would end up in landfills. The need to dispose of waste as part of the transportation network improvements would contribute to reduced capacity of landfills in the region, which may be insufficient to accommodate the region's waste disposal needs by 2050. Therefore, transportation network improvements would generate solid waste at a level that would exceed the capacity of permitted solid waste disposal facilities in the region and would require new or expanded solid waste disposal

facilities. Transportation network improvements and programs would have a significant impact on the solid waste disposal system in 2050.

2050 Conclusion

Implementation of regional growth and land use change and transportation network improvements and programs in the proposed Plan by 2050 would generate solid waste and C&D debris that may not be accommodated by the regional landfills. Although the forecasted growth and network improvements would comply with programs, policies, and practices to reduce the rate of solid waste generation, this impact (U-2) in the year 2050 would be significant.

MITIGATION MEASURES

U-2 GENERATE SOLID WASTE IN EXCESS OF STATE OR LOCAL STANDARDS OR IN EXCESS OF THE CAPACITY OF LOCAL INFRASTRUCTURE; IMPAIR THE ATTAINMENT OF SOLID WASTE REDUCTION GOALS; OR FAIL TO COMPLY WITH FEDERAL, STATE, AND LOCAL MANAGEMENT AND REDUCTION STATUTES AND REGULATIONS RELATED TO SOLID WASTE.

2035, 2050

U-2a Implement Mitigation Measures for New/Expanded Solid Waste Facilities.

During planning, design, and project-level CEQA review of solid waste facility projects, the County of San Diego, cities, and other solid waste management agencies can and should apply necessary mitigation measures to avoid or reduce significant environmental impacts associated with the construction or expansion of new or expanded solid waste facilities. Significant environmental impacts requiring mitigation may be identified in the following resource areas: air quality; biological resources; cultural resources; energy; greenhouse gas emissions; hydrology and water quality; noise and vibration; geology, soils, and paleontological resources; transportation; tribal cultural resources; and water supply. Mitigation measures may be similar to those described in this EIR for construction of development projects.

U-2b Reduce Construction Waste.

During planning, design, and project-level CEQA review and prior to the construction or demolition of transportation network improvement projects and development projects, SANDAG shall, and other transportation project sponsors, the County of San Diego, cities, and other local jurisdictions can and should, implement measures to reduce construction waste to comply with waste reduction goals identified by the state and local agencies, consisting of, but not limited to, the following:

- Ensure that source reduction techniques and recycling measures are incorporated into project construction and demolition.
- Reuse or recycle construction and demolition waste.

This mitigation measure would extend the life of existing landfills and delay the need to construct new or expanded landfills.

U-2c Reduce Operational Waste.

During planning, design, project-level CEQA review and construction of development projects, the County of San Diego, cities, and other local jurisdictions can and should integrate green building waste management measures such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED), Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. These measures consist of, but are not limited to, the following:

- Prepare and apply a waste management plan that promotes solid waste diversion.

- Implement source reduction through (1) using materials that are more durable and easier to repair and maintain, (2) designing to generate less scrap material through dimensional planning, (3) increasing recycled content, (4) using reclaimed materials, and (5) using structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings, etc.).
- Reuse existing structures and shells in renovation projects.
- Design for flexibility through the use of moveable walls, raised floors, modular furniture, moveable task lighting, and other reusable building components.
- Develop an indoor recycling program and space.

These mitigation measures would extend the life of existing landfills and delay the need to construct new or expanded landfills.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of the proposed Plan would result in significant impacts related to the construction of new or expanded solid waste facilities in 2035 and 2050. Implementation of mitigation measure U-2a would reduce these impacts through project-level planning, design, and CEQA mitigation measures. Mitigation measures U-2b and U-2c would further reduce this impact by extending the life of existing landfills and delaying the need to construct new or expanded landfills or landfill capacity. However, it cannot be guaranteed that all future project-level impacts can be mitigated to a less-than-significant level. Therefore, this impact (U-2) would remain significant and unavoidable.

4.15.5 Cumulative Impacts Analysis

C-PS-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO PUBLIC SERVICES

C-U-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO UTILITIES

C-REC-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO RECREATIONAL RESOURCES

The area of geographic consideration for cumulative impacts on public services and utilities is Southern California. Public services and utilities are common infrastructure throughout the region, and land use change and the transportation system would influence the location and demand for future development of new or additional services and utilities across the region. The provision of public services and utilities can be linked to jurisdictions, but often service providers cover large areas spanning multiple jurisdictional boundaries. Also, while some recreational facilities are local and serve only a small neighborhood, other recreational facilities provide opportunities for the population throughout the region. Thus, it is necessary to consider the region as a whole and the overall amount of development that would generate additional pressure and demand on services, utilities, and recreation facilities.

A hybrid approach for the analysis of cumulative public services and utility impacts allows for an overarching discussion of regional impacts associated with general patterns of regional urbanization, growth, and land use change that would create new or additional demand for services, utilities, and recreation facility use, or dictate where new or expanded infrastructure is located, while also allowing for specific consideration of any projects with known impacts to public services and utilities.

Growth, land use change, and transportation system improvements occurring throughout the Southern California region would impact public services and utilities. Significant cumulative impacts related to public services and

utilities would occur if the combination of impacts from the proposed Plan and impact projections in adopted plans would cause a substantial physical deterioration of public facilities or cause substantial adverse physical impacts associated with the provision of, or need for, new or physically altered public facilities to maintain adequate fire and police protection, schools, libraries, and recreation facilities; or result in the expansion or construction of wastewater treatment, storm water drainage, electricity/natural gas, or solid waste disposal facilities to adequately meet projected capacity needs or comply with regulations, the construction of which would cause significant environmental impacts.

The plans considered and relied on for this cumulative analysis include the SCAG 2024–2050 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and its EIR (SCAG 2024a, 2024b). Additionally, public service or utility providers, including cities, counties, special districts, school districts, and utilities that operate in Southern California, have adopted long-term plans that forecast the demand for services and identify specific facilities projects required to meet projected demand and needs.

Impacts of the Proposed Plan

As discussed above, the regional growth associated with the proposed Plan would require or result in the construction of new public services facilities or expansion of existing facilities, due to the higher levels of public service demand. This would result in short-term construction-related impacts, as well as operational impacts, to resources such as air quality, noise, and traffic. These impacts are typically reduced through actions of the implementing agency, including adherence to existing regulations and BMPs, but are considered significant because impact mitigation to less-than-significant levels for all projects cannot be guaranteed. Therefore, as described in paragraphs above, public service and utilities impacts due to the regional growth and land use change in the proposed Plan are significant in 2035 and 2050 (Impacts PS-1, U-1, and U-2).

Implementation of transportation network improvements would require minor use of public services and utilities and would generally not cause the need for new or expanded facilities. However, transportation network improvements associated with the proposed Plan would contribute to substantial adverse physical impacts associated with the construction of new or expanded storm water facilities in 2035 and 2050 (Impact U-1) and also result in substantial adverse physical impacts associated with the construction of new or expanded solid waste facilities in 2035 and 2050 (Impact U-2).

Implementation of regional growth and land use changes, as well as transportation network improvements, would result in increased demand for recreation facilities leading to accelerated deterioration and contribute to the physical removal of open space park and recreation lands. The proposed Plan would result in the removal of 2,031 acres of open space park and recreation lands by 2035 and 518 acres by 2050. Collectively, these impacts (Impact REC-1) would result in the substantial physical deterioration of existing park and recreation facilities.

Impacts of Related Projects

Projects planned in the Southern California region, such as the Navy Old Town Campus (OTC) Revitalization Project, border/POE facility improvements, airport expansions in the San Diego region, or port/maritime improvements associated with the Port Master Plan Update, would result in impacts related to increased demand for governmental utilities, such as wastewater collection and treatment facilities, storm water drainage facilities, energy infrastructure and solid waste facilities (U.S. Department of the Navy 2021). This regional growth would require or result in the construction of new facilities or expansion of existing facilities, due to the higher levels of public service demand. For example, the environmental impact statement (EIS) for the Navy OTC Revitalization Project determined that the project would result in increased density under several alternative options that would contribute to significant additional proposed growth in dwelling units, population, jobs, and nonresidential uses over the targets contained in the applicable community plan. An additional 40.2 acres of parkland would be required to meet the City of San Diego population-based standard for parkland if the property were to transfer out of federal ownership. Other projects, such as Mt. Etna Drive Developments, would similarly contribute to increased population growth and therefore result in additional demand on public services, recreational facilities, and utilities throughout the region.

Impact Projections in Adopted Plans

The County of San Diego General Plan EIR identified significant impacts on public services and utilities associated with the construction or expansion of police protection facilities, expansion of school facilities, and library facilities. Regionally, cumulatively considerable impacts on public services and utilities would result from implementation of the County of San Diego General Plan Update (County of San Diego 2011). The SCAG 2024–2050 RTP/SCS analyzes impacts on the SCAG region up to 2050 and found that even with implementation of identified mitigation measures, significant impacts on public services would result due to the considerable effects to the cumulative response times of police, fire, and emergency services in Southern California; direct and cumulative demand for school facilities; loss of open space and recreational lands; demand on existing recreational facilities; and direct and cumulative demand for solid waste services in the SCAG region (SCAG 2024a). Thus, regionally cumulatively considerable impacts on public services and utilities would result from implementation of the SCAG 2024–2050 RTP/SCS.

Throughout Southern California, individual cities and counties have also adopted general plans that guide growth and land use changes within their jurisdictions. Moreover, individual service providers, including cities, counties, special districts, school districts, and utilities, that operate in the Southern California region have adopted long-term plans that forecast the demand for services and identify specific facilities projects that will be required to meet projected needs. Each individual service provider, including cities, counties, special districts, school districts, and utilities, that has an adopted general plan or other long-term plan that forecasts the demand for services and identifies projects that will be required to meet projected needs, is responsible for conducting the appropriate environmental assessment, identifying impacts, and implementing mitigation measures to reduce impacts when possible. Construction-related and operational impacts are typically reduced through actions of the implementing agency, including adherence to existing regulations and BMPs, but are considered significant because impact mitigation to less-than-significant levels for all projects cannot be guaranteed.

Cumulative Impacts and Impact Conclusions

2035

As described above, impacts from construction of expanded or new facilities for public services and utilities from the proposed Plan and adopted plans in the Southern California region would be cumulatively significant in 2035 due to the compounding strain on public services, utilities, and recreational resources from regional growth. Because cumulative public services and utilities impacts, including solid waste and recreational resources impacts, throughout the Southern California region by 2035 would be significant, and because the proposed Plan's incremental impacts are significant, the proposed Plan's incremental public services and utilities impacts are also cumulatively considerable and thus significant (Impact C-PS-1, Impact C-U-1, and Impact C-REC-1).

2050

While many regional plans or projection impacts do not extend until the year 2050, public service and utility impacts, similar in nature to those identified for earlier years, would likely persist and also occur in 2050. As described above, impacts from construction and of expanded or new facilities for public services, utilities, and recreational resources from the proposed Plan and adopted plans in the Southern California, including solid waste, would be cumulatively significant in 2050 due to the compounding strain on public services, utilities, and recreational resources from regional growth. Because cumulative public services and utilities impacts, including solid waste and recreational resources impacts, throughout the Southern California region by 2050 would be significant, and because the proposed Plan's incremental impacts are significant, the proposed Plan's incremental public services and utilities impacts are also cumulatively considerable and thus significant (Impact C-PS-1, Impact C-U-1, and Impact C-REC-1).

MITIGATION MEASURES

C-PS-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO PUBLIC SERVICES

C-U-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO UTILITIES

C-REC-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO RECREATIONAL RESOURCES

Mitigation measures to reduce impacts associated with public services and utilities as identified in previous paragraphs in this section would be applicable to cumulative impacts as well.

The previous paragraphs in this section include mitigation measures PS-1, REC-1, U-1a, and U-1b, which call for jurisdictions with responsibility for construction of public facilities, recreation facilities, wastewater treatment facilities, or storm water facilities to apply mitigation measures to avoid or reduce significant environmental impacts associated with the construction or expansion of such facilities. This section also references mitigation measure WS-1a from Section 4.18, "Water Supply," regarding the reduction of water use for construction and operation of projects to conserve water. However, it cannot be guaranteed that all future project-level impacts can be mitigated to a less-than-significant level.

Mitigation measure U-2a calls for the reduction of impacts from construction or expansion of solid waste facilities, and mitigation measures U-2b and U-2c would reduce solid waste volumes that would require accommodation in regional landfills through the diversion of construction waste from transportation network improvement projects or other development projects and the implementation of green building waste management measures. However, it cannot be guaranteed that all future project-level impacts can be mitigated to a less-than-significant level.

Similarly, the SCAG 2024–2050 RTP/SCS EIR included mitigation measures to reduce impacts on public services, such as coordination with emergency service providers, avoidance and conservation of recreation and open space areas, patterns of urban development and land use that reduce costs on infrastructure and make better use of existing facilities green building measures, source reduction and recycling for construction projects, and waste management strategies. However, even with the implementation of mitigation measures, the EIR concluded that significant and unavoidable public service impacts would result.

Consistent with the above analysis, the proposed Plan's incremental contributions to cumulative public services and utilities impacts in years 2035 and 2050 would remain significant and cumulatively considerable post mitigation due to the compounding strain on public services, utilities, and recreational resources from regional growth.

This page is intentionally left blank.

4.16 TRANSPORTATION

This section evaluates the transportation impacts of the proposed Plan.

4.16.1 Existing Conditions

The San Diego regional transportation system is a complex and expansive multimodal network that supports the demand for personal travel and is the backbone of the region's economic base. The transportation network connects residents and visitors to places of employment, education, shopping, recreation, and residences. The transportation network is also essential for the movement of goods and continued economic development.

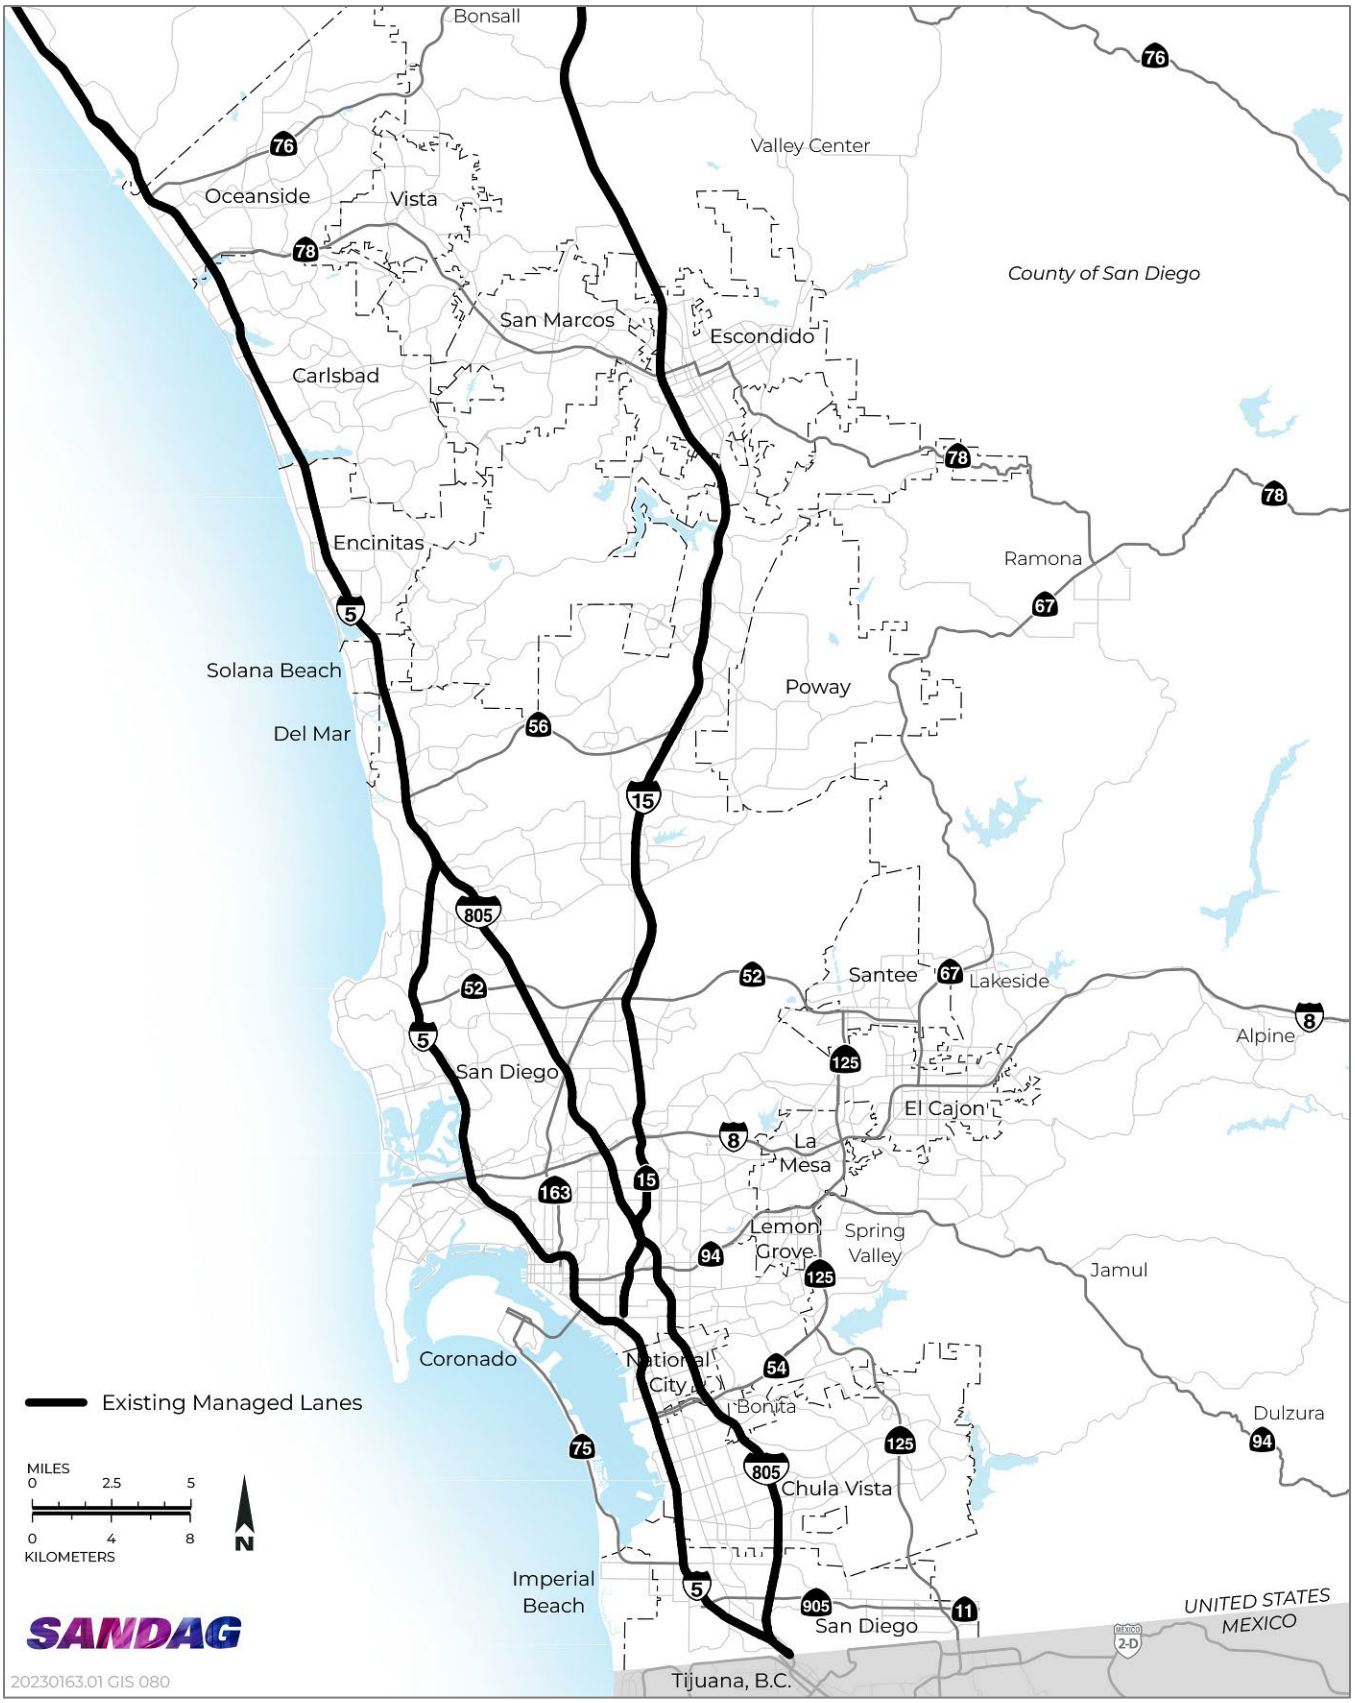
The transportation system includes interstates, state highways, arterial roadways, local roadways, public transportation systems, nonmotorized transportation facilities, maritime and aviation facilities, and land ports of entry (POEs). The regional roadway system is an interconnected network of freeways, state highways, toll roads, arterial roadways, and local roadways. The roadway network allows for the movement of personal vehicles, micromobility transport, bicycles, buses, commercial vehicles, ride-share services, and heavy trucks. The regional public transit system includes local and regional bus operations, regional and interregional commuter rail services, and light rail service. The freight railroad network includes two freight rail corridors distributing cargo and goods. Nonmotorized transportation facilities generally include walkways and bikeways. Often bikeway facilities, such as bike routes, bike lanes, and cycle tracks, are located within the roadway right-of-way. Shared facilities, such as multiuse paths, are generally not associated with a roadway facility. The airport system consists of commercial, general, and military aviation facilities serving passenger, freight, business, recreational, and military needs. Individual components of the regional transportation network are described in the following sections.

Both the current (year 2025) and baseline year (year 2022) conditions of the region's transportation network are discussed in the following sections. SANDAG uses a disaggregate third-generation activity based model (ABM3) which is calibrated to year-2022 conditions under its base year scenario. The ABM3 is the most up-to-date transportation forecast within the San Diego region and is the best tool in which the metrics used to evaluate effects of land use growth and transportation network improvements can be measured at a regional level, including activity and tour (trip) generation, mode split, average trip length, and vehicle miles traveled (VMT). Therefore, the majority of the transportation impact analysis presented in Section 4.16.4. "Environmental Impacts and Mitigation Measures," below, was conducted using the ABM3 and uses year 2022 as the base year scenario. Transportation conditions evolve slowly, and usually only minor changes in the network occur over a 3-year period. Therefore, as shown in the following sections, the differences between baseline year 2022 and current conditions are minor (less than 2 percent for most facility types) and would not affect the overall findings of the transportation impact analysis.

ROADWAY NETWORK

The primary purpose of the roadway network (Figure 4.16-1) is to facilitate the movement of people and goods. The roadway network within the region serves many purposes and can accommodate several modes of travel, such as buses, personal automobiles, commercial automobiles, the movement of freight, and bicycles and micromobility vehicles. Local streets and arterials traverse communities and are typically used for shorter trips, while the region's freeways and state highways provide access to major job centers, educational institutions, recreation, and travel to destinations outside the region. The regional roadway network is a complex and expansive system that is planned, designed, built, operated, and maintained by numerous agencies, such as the region's local jurisdictions, Caltrans, tribal governments, and SANDAG.

Table 4.16-1 summarizes the existing roadway network within the San Diego region.



Source: Data received from SANDAG in 2025; adapted by Ascent in 2025.

Figure 4.16-1 Existing Roadway Network

Table 4.16-1 Existing Roadway Facilities in the Region

Facility Type	Year 2022 Centerline Miles	Year 2022 Lane Miles	Year 2024 Centerline Miles	Year 2024 Lane Miles
Freeway: general purpose	335	2,417	335	2,420
Freeway: Managed Lanes	39	114	53	141
Tollway	11	48	11	48
State highways	276	641	276	641
Regional arterial network	1,045	3,773	1,046	3,792
Local roadways	2,936	6,696	2,945	6,727

Notes: centerline miles = total miles of roadway type, regardless of the number of lanes provided; lane miles = total miles of roadway multiplied by the number of lanes along each segment.

Transportation forecast activity-based model (ABM3) (which is calibrated to year-2022) and year 2024 transportation network.

Source: Data provided by SANDAG in 2025.

As shown in Table 4.16-1, the total tollway and state highway centerline miles and lane miles did not increase between year 2022 and year 2024. Freeway general purpose lanes, regional arterials, and local roadways saw only a nominal increase in both centerline miles (less than 0.3 percent) and lane miles (0.5 percent) over the same period. Finally, freeway managed lanes saw a more substantial increase of 35.2 percent in centerline miles and an increase of 23.7 percent in total lane miles over this period.

Public Transit

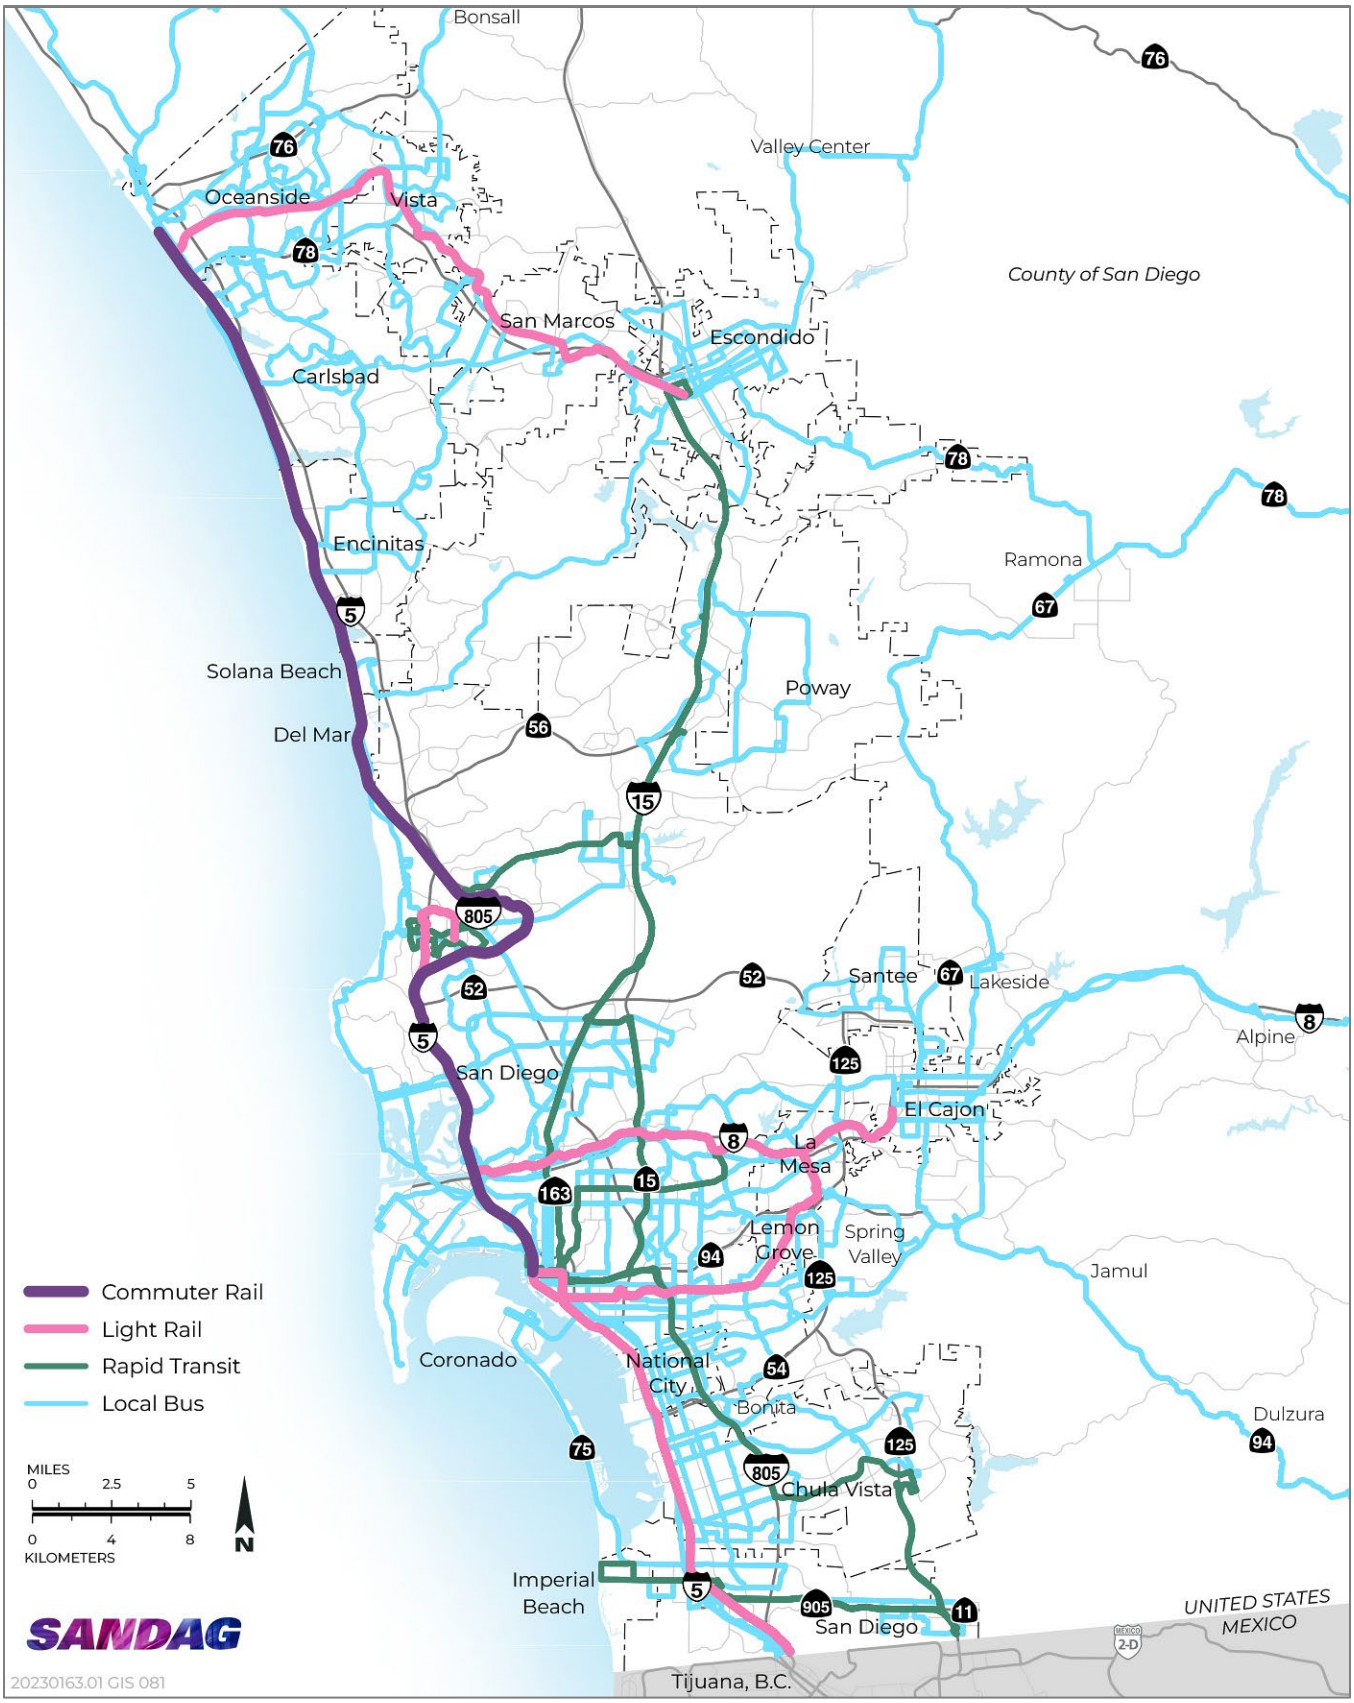
The primary forms of public transportation throughout the San Diego region are commuter rail, light rail, bus rapid transit (*Rapid*), and local and express bus services. Additionally, on-water transit services, such as ferries and water taxis, are operated in the San Diego Bay, connecting between Downtown San Diego and Coronado. The existing transit network is depicted in Figure 4.16-2. Generally, these forms of public transit are centered in the western portion of the region, near the more densely populated coastal communities and commuter corridors. Many of the less dense and rural communities in the eastern portion of the region have limited access to regional public transportation. The commuter rail, light-rail, *Rapid*, and bus services within the region are primarily provided by Metropolitan Transit System (MTS) and North County Transit District (NCTD).

Light Rail

Throughout the San Diego region, light-rail service is provided by NCTD and MTS. The NCTD SPRINTER is a diesel-powered, light-rail system that travels a 22-mile east–west route serving 15 stations and connecting Oceanside, Vista, San Marcos, and Escondido generally along the SR 78 corridor. The SPRINTER operates every 30 minutes in each direction, Monday through Friday, from approximately 4 a.m. until 9 p.m. Trains on Fridays and Saturdays run later, and trains on Saturdays, Sundays, and holidays operate every 30 minutes from 10 a.m. until 6 p.m. and hourly before and after those hours (NCTD 2024a).

The San Diego Trolley is a light-rail passenger service operated by San Diego Trolley, Inc., which is owned by MTS. The San Diego Trolley system consists of four lines, including the UC San Diego Blue Line, Orange Line, Sycuan Green Line, and the County Connector Copper Line. There are 53 trolley stations within the region, connected by 54.3 miles of rail. Each of these four lines is described below (MTS 2025a):

- The UC San Diego Blue Line currently covers 26.3 miles and includes 32 stations. The route extends between UC San Diego/Westfield University Town Center (UTC) and the San Ysidro transit station at the United States–Mexico border. The route also accesses the Old Town Transit Station, Santa Fe Depot, National City, and Chula Vista. The Blue Line currently runs at 7- to 8-minute headways during peak periods and 15-minute headways in off-peak periods Monday through Sunday. Late night service (after 11 p.m.) on this line runs every 30 minutes.



Source: Data received from SANDAG in 2025; adapted by Ascent in 2025.

Figure 4.16-2 Existing Transit Network

- The Orange Line currently covers 17.1 miles and includes 18 stations, extending from the San Diego Courthouse Station in Downtown San Diego to the El Cajon Transit Center via southeastern San Diego, Lemon Grove, and La Mesa. The Orange Line currently runs at 7- to 8-minute headways during peak periods (between the Spring Street Station and City College Station) and 15-minute headways in off-peak times until 8:15 p.m. when headways increase to 30 minutes Monday through Friday. On Saturdays and Sundays, the Orange Line currently runs at 15-minute headways during midday, and 30-minute headways during mornings and evenings.
- The Sycuan Green Line services 19.8 miles and includes 24 stations, operating from the 12th and Imperial Station in Downtown San Diego to the Old Town Transit Center via the bayside alignment, then east to the 70th Street station near San Diego State University (SDSU). The Green Line operates a 15-minute service during peak times Monday through Friday and midday Saturdays, and a 30-minute service during other times of the day.
- The County Connector Copper Line currently covers 3.8 miles and includes 4 stations, extending from the El Cajon Transit Center to Santee Town Center. The Copper Line replaced existing Green and Orange Line service, east of the El Cajon Transit Center, for the purpose of reducing the impacts of a previous single-track segment and improving service reliability between El Cajon Transit Center and Santee. The Copper Line runs at 15-minute headways during peak times Monday through Friday and midday Saturdays, and a 30-minute service during other times of the day.

Rapid

MTS currently operates nine *Rapid* bus routes within the southern portions of the county. It should be noted that the current *Rapid* bus routes partially operate within an exclusive right-of-way, as is more typical with bus rapid transit services. The current *Rapid* bus services provide high-frequency, limited-stop bus service from various transit centers within the region to downtown or one of the major universities in the region (UC San Diego, SDSU, and the University of San Diego).

Bus

MTS operates almost 100 fixed bus routes and ADA complementary paratransit service throughout its service area. MTS's service area primarily covers the central and southern portions of the San Diego region. Fixed-route bus service includes local, urban, express[1], premium express, and rural routes (MTS 2025b). Bus services are provided by the San Diego Transit Corporation, which is owned by MTS. MTS bus service extends from the international border to as far north as Escondido. All MTS buses are equipped with a lift or a ramp for boarding mobility impaired riders.

The NCTD bus system, known as the BREEZE, serves the northern San Diego region. BREEZE operates approximately 30 bus routes from Oceanside south to La Jolla/UTC, southeast to Escondido, northeast to the Pala community, and north to Fallbrook (NCTD 2024b). NCTD also provides an on-demand FLEX bus service, which includes routes to Ramona and Marine Corps Base (MCB) Camp Pendleton. The NCTD service area also includes four Native American reservations governed by the Rincon Band of Luiseño Indians, Pala Band of Mission Indians, Pauma Band of Luiseño Indians, and San Pasqual Band of Diegueno Mission Indians. NCTD's BREEZE buses are all accessible to persons with disabilities. All buses are equipped with a lift or ramp to assist in boarding mobility-impaired riders. Finally, NCTD services include the LIFT paratransit service, which provides origin-to-destination service for people with disabilities unable to use BREEZE buses or rail services.

Passenger and Regional Commuter Rail

Throughout the San Diego region, passenger and commuter rail services are provided by Amtrak, NCTD, and Metrolink, all of which travel along different segments of the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor. The LOSSAN Rail Corridor is the second-busiest intercity passenger rail corridor in the United States and the busiest state-supported Amtrak route. The LOSSAN Rail Corridor service includes 41 stations and more than 95 daily passenger trains, with an annual ridership of nearly 1.6 million on Amtrak Pacific Surfliner intercity trains and 3.74 million on Metrolink and COASTER commuter trains (OCTA 2024).

[1] Express bus routes are typically longer routes with fewer stops to allow for shorter travel times over longer distances. Unlike Rapid bus routes, express bus routes do not operate within an exclusive right-of-way.

Amtrack's Pacific Surfliner provides intercity connections between downtown San Diego, Orange County, Los Angeles, Santa Barbara, and San Luis Obispo. It also connects to the nationwide rail system via Union Station in Los Angeles. The Pacific Surfliner offers 10 daily round trips from San Diego to Los Angeles Union Station, and 5 round trips from Los Angeles to Goleta (just north of Santa Barbara), with 2 daily trips extending to San Luis Obispo.

The COASTER is operated by NCTD and also travels along the LOSSAN Rail Corridor. The COASTER provides passenger commuter rail service with eight stops along 41 miles of track between Downtown San Diego and Oceanside. The COASTER primarily serves commuters on weekdays, with more than 20 trains scheduled during typical commute hours. The COASTER operates 7 locomotives and 28 bi-level coaches (NCTD 2024c).

Metrolink is a regional passenger commuter rail service, formed by the Southern California Regional Rail Authority, that operates within the LOSSAN Rail Corridor. The Metrolink system consists of nine routes with 67 stations along 437.5 route miles. Metrolink provides service to 25,053 average weekday riders. The only Metrolink station within the San Diego region is located in Oceanside, and it runs along the Orange County Line. The Orange County Line (which runs from Oceanside to Los Angeles) has 15 stations and 87.2 route miles, with an average of 4,802weekly riders (Metrolink 2025).

Micro-transit

Micro-transit is a service that offers flexible routing or flexible scheduling of minibus vehicles, which are typically electric powered. Micro-transit serves a range of 1.5-4.5 miles carrying up to 15 passengers. NEVs typically have a service range of 0.5 to 2 miles, carry up to 6 passengers, and are permitted to operate on streets with speed limits of 35 miles per hour or less. Both micro-transit and NEVs are typically requested with a smartphone app and pick-up and drop-off activities occur anywhere within a defined service area, at designated locations, or a hybrid of the two.

Free Ride Everywhere Downtown (FRED), which is operated by Circuit, is a local example of on-demand (via cell phone app) curb-to-curb service anywhere within Downtown San Diego. There are currently no publicly operated stop-to-stop micro transit services in the San Diego region.

Tables 4.16-2 and 4.16-3 summarize the year 2022 and current transit services provided within the San Diego region, respectively.

Table 4.16-2 Year 2022 Transit Services in the Region

Agency	Type	Total Number of Routes	Total Route Miles	Total Number of Stops	Total Number of Major Stops	Average Daily Passengers[1]	Annual Passengers[2]
MTS	Light rail	3	72	63	63	90,745	29,739,499

Source: Data provided by SANDAG in 2025.

As shown in Tables 4.16-2 and 4.16-3, the total route miles of transit service did not change between 2022 and 2024, across all three service providers.

ACTIVE TRANSPORTATION

Active transportation facilities within the region include bicycle facilities, such as bike routes, bike lanes, cycle tracks, and multiuse paths, as well as pedestrian facilities, such as sidewalks, pedestrian bridges, and pathways. Active transportation also includes micromobility transport, such as electric scooters (e-scooters), e-bikes, bikeshare, and neighborhood electric vehicles (NEVs).

Bicycle Facilities

The San Diego regional bicycle network is composed of the following five main facility types:

- **Class I Multi-Use Path***:* Also referred to as a bike path or multiuse path, Class I facilities provide a completely separated right-of-way designed for the exclusive use of bicycles and pedestrians with crossflows by motorists minimized. Multiuse paths can provide connections where roadways are non-existent or unable to support bicycle travel. The minimum paved width for a two-way, multiuse path is considered to be an 8-foot paved pathway with a 2-foot-wide graded area adjacent to either side of the pavement (12 feet total width).
- **Class II Bike Lane:** This facility provides a striped lane designated for the exclusive or semi-exclusive use of bicycles, with through travel by motor vehicles or pedestrians prohibited. Bike lanes are one-way facilities located on either side of a roadway. Pedestrian and motorist crossflows are permitted across bike lanes at intersections and driveways. Additional enhancements, such as painted buffers and signage, may be applied. The minimum bike lane width is considered to be 5 feet.
- **Class III Bike Route:** This facility provides shared use of traffic lanes with cyclists and motor vehicles, identified by signage and/or street markings such as "sharrows." Bike routes are best suited for low-speed, low-volume roadways with an outside lane of 14 feet or greater. Bike routes provide network continuity or designate preferred routes through corridors with high demand.

- **Class IV Cycle Track:** Also referred to as separated or protected bikeways, cycle tracks provide a right-of-way designated exclusively for bicycle travel within the roadway. Cycle tracks are physically protected from vehicular traffic both horizontally, through a buffered area, as well as vertically, utilizing treatments such as grade separation, flexible posts, bollards, railings, art pieces, or on-street parking. Cycle tracks can provide for one-way or two-way travel. A one-way cycle track has a minimum 5-foot-wide travel lane with a 3-foot buffer (8 feet in total), while a two-way cycle track has a minimum 8-foot-wide travel way with a 3-foot buffer (11 feet in total) (Caltrans 2025a).
- **Bike Boulevard:** Bike Boulevards are streets with low motorized traffic volumes and speeds, designated and designed to give bicycle travel priority. Bike Boulevards use signs, pavement markings, and speed and volume management measures to discourage through trips by motor vehicles and create safe, convenient bicycle crossings of busy arterial streets. It should be noted that Bike Boulevards are not separately distinguished in the Caltrans Highway Design Manual from Class III Bicycle Routes. However, the National Association of City Transportation Officials' *Urban Bikeway Design Guide* does recognize Bike Boulevards as a separate form of classification.

There are approximately 3,477 lane miles of existing bikeway facilities in the region, as detailed in Table 4.16-4. Class II facilities are the predominant type of bikeway at roughly 66.6 percent of the total, followed by Class III facilities at 20.3 percent. Class I facilities make up about 10.5 percent of the regional total, and Class IV Cycle Tracks make up 2.1 percent. Figure 4.16-3 shows the existing bicycle network throughout the San Diego region.

Table 4.16-4 Existing Bicycle Facilities in the Region

Facility Type	Year 2022 Lane Miles	Year 2022 Percentage of Total	Existing (2024) Conditions Lane Miles	Existing (2024) Conditions Percentage of Total
Class I Multi-Use Path	354	10.4%	366	10.5%
Class II Bike Lane	2,284	66.8%	2,316	66.6%
Class III Bike Route	722	21.1%	707	20.3%
Class IV Cycle Track	45	1.3%	72	2.1%
Bike Boulevard	15	0.4%	16	0.5%
Total	**3,420**	**100.0%**	**3,477**	**100.0%**

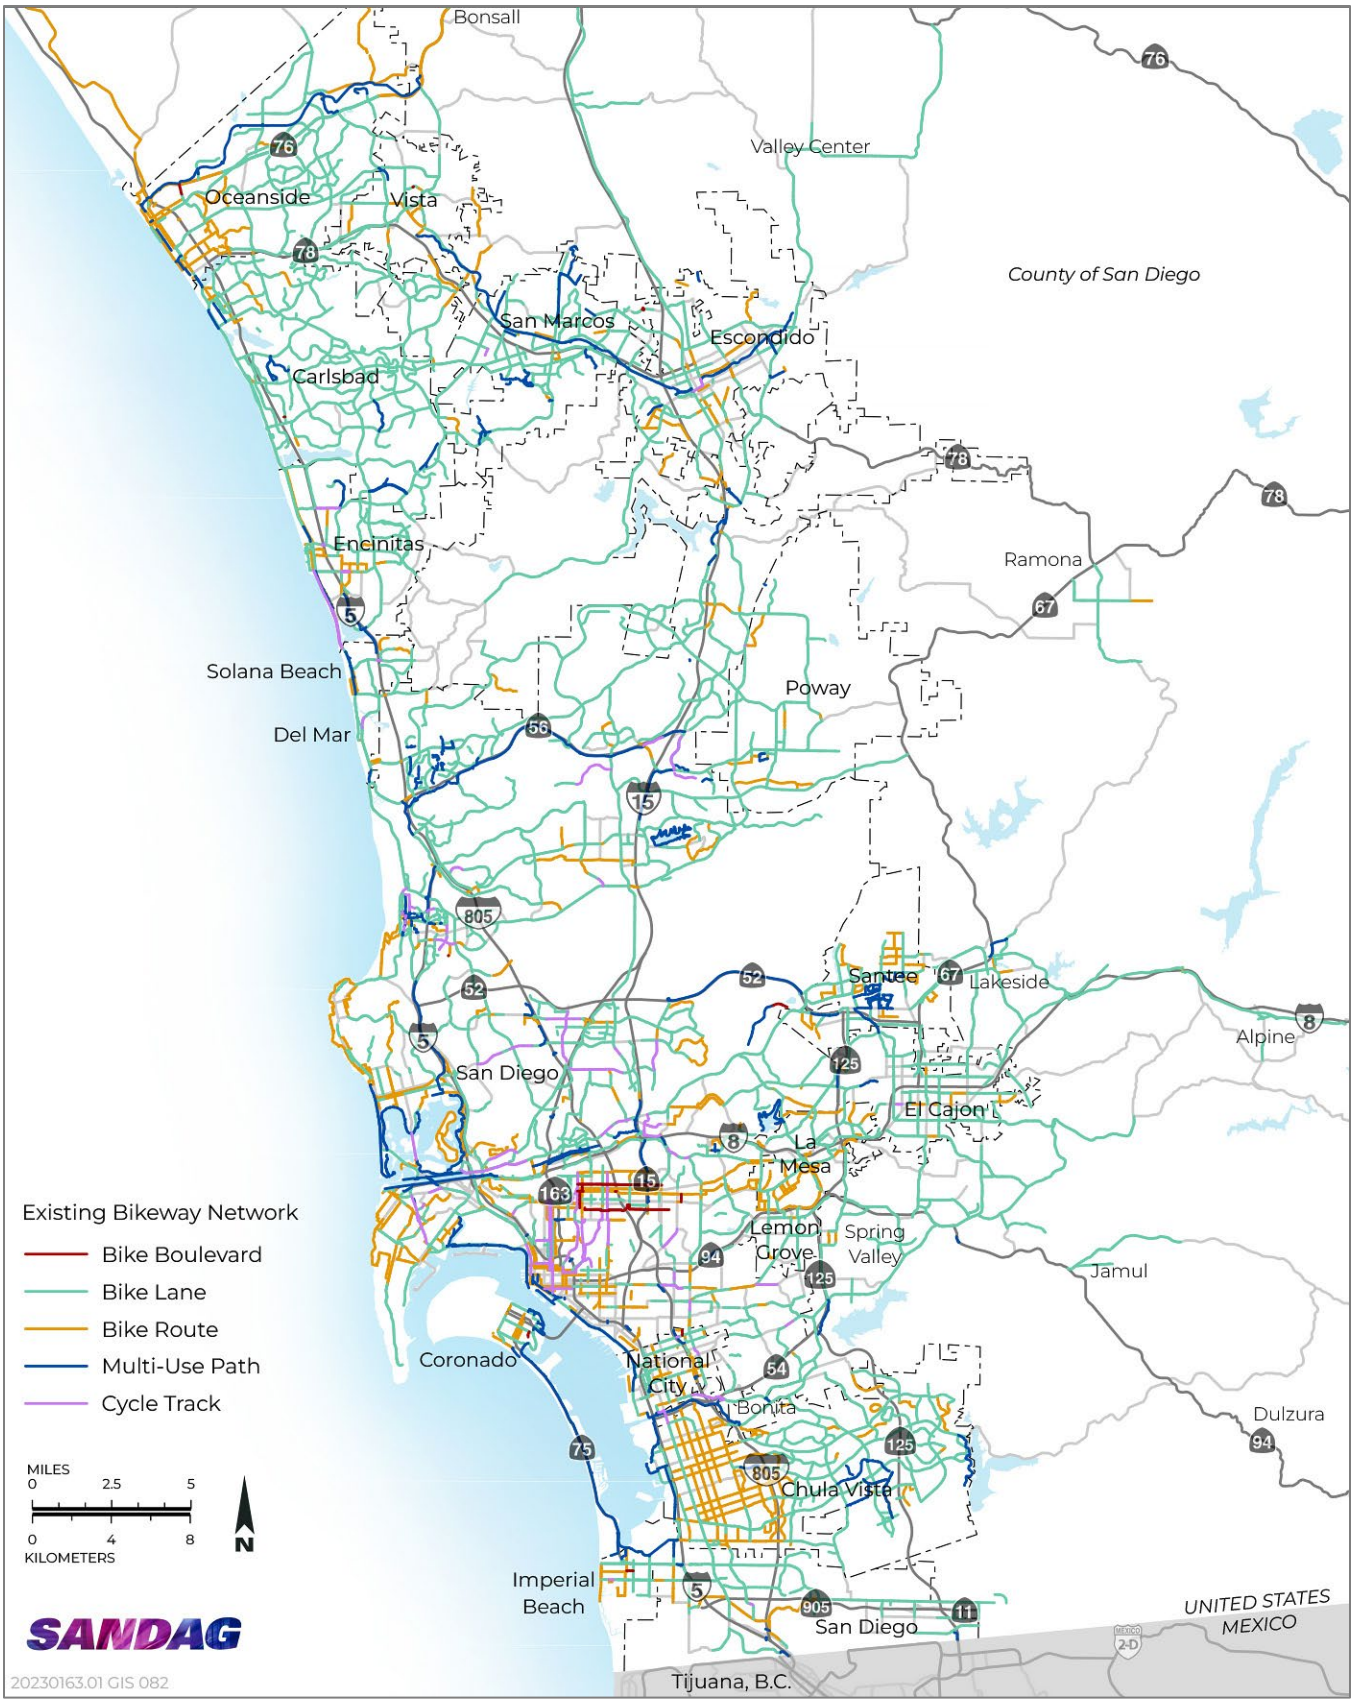
Source: Data provided by SANDAG in 2025; SANGIS.

As shown in the table, the ratio of facility types stayed rather consistent between 2022 and 2024; however, there was an 1.6 percent increase in the lane miles of facilities over this same period.

Micromobility

Micromobility refers to small, lightweight travel devices that generally travel short distances at low speeds. In the San Diego region, popular micromobility devices include e-bikes, e-scooters, and NEVs. Similar to bicycles, e-scooters are not allowed to be ridden on the sidewalk and are required to either be within a bike facility, such as a bike lane, or in the outside travel lane of the roadway.

A NEV is a small electric vehicle that typically operates within a defined service area and fulfills trips that cover a short distance, typically less than 2 miles. NEVs help to facilitate connections to and from transit stations and provide users with an alternative to driving for short trips. NEVs are generally available to rent through public sharing programs or through personal ownership. There are currently no NEV-sharing programs operating within the San Diego region. NEVs are allowed to be driven within the travel lane of roadways with speed limits that do not exceed 35 miles per hour (mph) (California Vehicle Code Sections 385.5 and 21260); however, they generally have a maximum speed of 25 mph. Along higher speed roadways, NEVs are permitted within the bike lane, if adequate width is provided, or within designated facilities.



Source: Data received from SANDAG in 2025; adapted by Ascent in 2025.

Figure 4.16-3 Existing Bicycle Network

There are currently no app based or regional providers for e-bike or e-scooter rentals within the San Diego Region. However, localized shop-based rentals for e-bikes and e-scooters are available within the downtown and beach communities.

Pedestrian Facilities

Walking is also a part of an active transportation network. Pedestrian facilities primarily include sidewalks and crosswalks associated with arterials and roadways, as well as pedestrian bridges and other connections across highways and rail facilities. Generally, most major public roadways within the incorporated jurisdictions of the San Diego region include sidewalk facilities along both sides. Local jurisdictions have the authority to implement their own sidewalk requirements and standards, as long as they are consistent with the minimums set forth the American Disabilities Act (ADA). Additionally, most signalized intersections within the region include crosswalks on legs in which pedestrians are allowed cross, as well as pedestrian curb ramps. The pedestrian ramp requirements included in the ADA has changed the multiple times over the last 20 years, including the most recent update in 2023. As such, a portion of the existing pedestrian ramps within the San Diego region no longer meet current ADA standards. However, any ramp that does not currently meet ADA standards is required to be improved to meet the current standards as part of any construction or improvements at the intersection or along the adjacent roadway. Therefore, non-compliant ramps will be updated overtime, as well as in conjunction with any improvement included in the proposed Program that occur at a non-compliant ramp location.

Trail facilities are also considered part of the pedestrian network. The trail facilities in the San Diego region are further described and analyzed in Section 4.15, "Public Services, Recreation, and Utilities," of this EIR, along with other recreational facilities.

PARKING

On- and off-street parking within the San Diego region is generally regulated within each local jurisdiction's municipal code. Generally, local jurisdictions within the San Diego region require that a minimum number of parking spaces be provided on-site and directly adjacent to the land use in which they support. Typically, the minimum number of parking spaces is determined based on the type and size of land use in which they are intended to serve. Under specific circumstances (such as urban core areas), jurisdictions will typically allow for parking to be located in a centralized, shared, off-site location, that is within a specific distance of the uses in which it serves. These type of centralized shared parking strategies are generally most effective in dense and mixed-use areas with land uses that have offsetting times of peak parking demand. As an example, the parking demand for commercial and office uses typically occurs in the middle of the day and these uses have little to no demand at night. Conversely residential uses have lower parking demands during the daytime but experience their peak demand at night. Centralized shared parking programs allow jurisdictions to more efficiently accommodate the parking demand of both uses by sharing the same pool of parking spaces between both uses. The commercial demand fills the spaces during the daytime, while the residential uses fill those same spaces during the night; thus, reducing the overall number of spaces needed to accommodate both uses.

The State of California adopted AB-2097 in September 2022, this bill restricts jurisdictions from imposing parking minimums for most land uses if the project is located within one-half mile of public transit. As such, land uses within these areas are no longer subject the local jurisdictions parking requirements. Finally, Caltrans also provides Park & Ride locations at strategic points along the region's freeway network, as well as joint locations, with transit agencies (MTS and NCTD), at major transit stations.

AIRPORTS

The San Diego region is home to 16 public-use and military airports, as shown in Figure 4.9-2 and discussed further in Section 4.9, "Hazards and Hazardous Materials." Located adjacent to Downtown San Diego, the San Diego International Airport (SDIA) is the busiest single-runway commercial service airport in the nation. The airport served approximately 15.6 million passengers in 2021 and hosted 16 passenger carriers.

Other regional airports include Oceanside Municipal Airport, McClellan-Palomar Airport, Montgomery Field, Gillespie Field Airport, and Brown Field Municipal Airport. Rural airfields, generally located in the eastern portion of the San Diego region, are Fallbrook Community Airpark, Ramona Airport, Borrego Valley Airport, Ocotillo Airport, Agua Caliente Airport, and Jacumba Airport. Military airfields in the region are Marine Corps Air Station Camp Pendleton, Marine Corps Air Station Miramar, Naval Air Station North Island, and Naval Outlying Field Imperial Beach (SDIA 2021).

GOODS MOVEMENT AND FREIGHT

The movement of goods and freight throughout the San Diego region is an important component to the region's transportation operations. The San Diego region's location is critical in the international transport of goods through multiple international POEs, with Mexico to the south and the Ports of Los Angeles and Long Beach to the north. The San Diego region is also home to two international marine terminals: the National City Marine Terminal (NCMT) and the Tenth Avenue Marine Terminal (TAMT).

Truck

The predominant mode in San Diego's diverse and expansive goods movement network is commercial trucking. Trucking has played a pivotal role in enabling the region to harness the economic benefits of growing international trade. In 2019, Mexico became the United States' top overall trade partner. Currently, more than 90 percent of California–Mexico trade is moved by truck. In 2019, the Otay Mesa and Tecate POEs processed a combined $48.3 billion in total bilateral trade, and that number is expected to grow over the coming years (SANDAG 2021). The most common commodities that cross the California–Mexico border by truck are high-value items, such as electronics, medical devices, and automobiles. These commodities are expected to continue to dominate cross-border trade, especially with the passage of the United States–Mexico–Canada Trade Agreement. International trade, however, accounts for only a portion of the goods that trucks carry through San Diego County. Freight traveling within the county or to and from other domestic locations accounts for more than 85 percent of the truck tonnage on the region's interstate freeways, highways, and local roads, which equates to approximately 50 million tons per year (SANDAG 2016).

Rail

In addition to commercial truck crossings, San Diego also has a rail freight crossing at its San Ysidro Port of Entry, where the Main Line—owned by the MTS subsidiary San Diego and Arizona Eastern Railway Company (SD&AE)—terminates. Freight on this short line is operated by the San Diego and Imperial Valley Railroad (SDIV). A defunct rail crossing, which would connect the SD&AE Main Line through the Tijuana–Tecate short line to the currently nonoperational Desert Line, also exists about 5 miles east of the Tecate POE. While accounting for only a small portion of total cross-border trade, approximately $96 million of goods pass through San Diego's rail crossings. These rail imports consist primarily of agricultural goods and raw materials, such as stone, iron, and steel.

San Diego's rail infrastructure also carries a significant amount of domestic freight. Of the approximately 3,200 rail carloads carried by SDIV in 2019, about half are transported between locations other than the international border. The region is also served by the LOSSAN Rail Corridor, which carries approximately $1 billion of freight annually by its Class I freight operator, the Burlington Northern Santa Fe (BNSF) Railway Company (NCTD 2020).

Maritime

While the majority of imports that pass through the San Diego goods movement network complete a portion of their journey on trucks or trains, many international goods arrive in the region by ship. Between the TAMT and the NCMT, more than 1.9 million metric tons of waterborne cargo are processed by San Diego's seaports annually (USACE 2022). In addition to standard shipping containers, San Diego's maritime ports are equipped to process breakbulk and refrigerated cargo. NCMT primarily handles lumber and automobiles, while TAMT receives a wider variety of goods, including fruit, sand/cement, and petroleum products. Both TAMT and NCMT have on site rail connections and are minutes away from major freeways for transport of waterborne cargo by rail or truck.

By providing the region with valuable goods and high-quality employment, the Port of San Diego is an important economic driver. A 2017 economic impact analysis found that industrial and maritime commerce at the port directly contributed 13,348 jobs and $2.65 billion in economic output to the county. With tourism activity and indirect economic benefits included, the Port of San Diego's total economic impact on the region is estimated to be more than $9.4 billion annually (Port of San Diego 2019).

Air Cargo

Another way goods enter and leave San Diego County is through its airports. In addition to being the nation's busiest single-runway commercial airport, SDIA handled more than 147,000 tons of cargo in 2021 (SDIA 2021). Mail makes up a significant portion of the cargo that arrives at the airport. Upon arrival, mail is trucked to off site sorting facilities before being sent to its final destination. Unlike the region's maritime ports, which almost exclusively processes international goods, SDIA primarily handles domestic cargo.

Pipeline

Finally, San Diego's goods movement network also includes two privately owned pipelines that bring in about 700,000 tons of aviation fuel and gasoline per year (Port of San Diego 2019).

Freight Rail

Freight rail services in the San Diego region are predominantly operated within the LOSSAN Rail Corridor by the BNSF Railway. Union Pacific Railroad trains also operate within the corridor north of the San Diego region (OCTA 2024). The LOSSAN Rail Corridor covers a six-county coastal region spanning 351 miles along the Southern California coast, with over 60 miles located in the San Diego region. More than 70 freight trains run along the LOSSAN Rail Corridor each day. As noted above in the "Public Transit" section, passenger and commuter rail services also operate within the LOSSAN Rail Corridor.

The SD&AE Rail Corridor straddles the United States–Mexico border, connecting San Diego, Tijuana, Tecate, and the Imperial Valley. The US section of the railroad is owned by MTS, and the 44.3 miles in Mexico are owned by the Mexican national railway, Ferrocarril Sonora-Baja California Railroad. The SD&AE runs on four lines (or "branches") totaling 108 miles, each of which are described below (MTS 2013).

- **Main Line:** Extends from Center City San Diego south to San Ysidro/international border at Tijuana with a total length of 15.5 miles. This line extends through Mexico (44.3 miles) and connects with the Desert Line (see below).
- **La Mesa Branch:** Extends from Downtown San Diego east to the city of El Cajon (though the City of La Mesa) with a total length of 16.1 miles.
- **Coronado Branch:** Extends from National City south to Imperial Beach with a total length of 7.2 miles. The Coronado Branch is currently not in use.
- **Desert Line:** Extends north and east from the international border (junction called Division) to Plaster City with a total length of 69.9 miles, where it joins the Union Pacific Line from El Centro. The Desert Line is currently not in use; however, efforts are currently being made to rehabilitate degraded portions of this line and start rail services again.

The SDIV Railroad currently provides freight services on the Main Line and La Mesa Branch (MTS 2013).

The freight rail corridors within the region are displayed in Figure 4.16-4.

TRANSPORTATION PROGRAMS

Transportation programs generally combine physical and digital infrastructure to better manage the operations of the region's transportation network.

Transportation Demand Management

TDM refers to programs and strategies that manage and reduce traffic congestion during peak travel times. Typical TDM programs include carpooling and vanpooling; promoting alternative work schedules; teleworking; and increasing bicycle, pedestrian, and transit use. These programs are designed to reduce congestion and the overall VMT generated within the region. The main goal of TDM programs is generally to make more efficient use of the existing transportation network within the region and to better maximize the movement of people and goods.

The comprehensive TDM program for the San Diego region is the Sustainable Transportation Services program, which is operated by SANDAG in cooperation with the region's 511 transportation information services. The goal of Sustainable Transportation Services is to reduce traffic congestion during peak times, as well as decrease greenhouse gas (GHG) emissions and other environmental pollutants, by reducing the number of commuters driving to work or school alone each day. The Sustainable Transportation Services program pulls together trip-reduction strategies and state-of-the-art web tools to provide access to convenient transportation choices that reduce auto dependency, vehicle energy consumption, and emissions. Specific programs and services provided by Sustainable Transportation Services include a vanpool subsidy program, transit solutions, regional support for biking, a Guaranteed Ride Home program, information about teleworking, and bike and pedestrian safety program support for schools (SANDAG 2025a).

As of 2023, 71 percent of commuters in the San Diego region drive alone to work, while only 18 percent carpool and 3 percent take transit. The Sustainable Transportation Services program works with employers to offer their employees choices other than driving alone. In 2023, these programs made significant impacts on changing travel behavior (SANDAG 2025a):

- The Sustainable Transportation Services program currently has 395 active vanpools, which helped almost 26,000 people commute in 2023.
- 269 employees from 16 different employers signed up to try transit for the first time.
- During Bike Anywhere Day, more than 9,000 people across the region rode their bikes.

Transportation System Management/Intelligent Transportation Systems

Transportation system management (TSM) and intelligent transportation systems (ITSs) provide the means to effectively manage the overall transportation system, including the demands on the system. TSM/ITSs use innovative technologies that maximize the efficiency of the transportation network and promote greater multimodal system efficiencies that support changes in the modes in which people choose to use to travel (mode changes) over time, which can ultimately lower GHG emissions. TSM/ITS components are discussed in additional detail in Chapter 2, "Project Description," of this EIR.

Integrated Corridor Management

In 2006, SANDAG and its partners initiated the development and implemented the Integrated Corridor Management (ICM) system pilot project ICM connected the transportation operations systems for multiple jurisdictions along the northern section of the I-15 corridor. Post analysis evaluation of the ICM project resulted in substantial improvements to the performance of the I-15 corridor. ICM enabled multiple systems to "talk" to each other and coordinated their operations to maximize efficiency regardless of which jurisdiction owned or operated the individual system. The ICM system also monitored changing roadway conditions and congestion based on real-time information and then generated automated response plans to address the situation.

Source: Data received from SANDAG in 2025; adapted by Ascent in 2025.

Figure 4.16-4 Freight Rail Corridor

The system had the ability to reevaluate and generate new response plans as traffic conditions change further. An ICM multimodal response plan included several key features:

- Coordination of the I-15 Express Lanes system with Caltrans' changeable message signs, 511 traveler information, ramp meters, and arterial signal systems to bypass major incidents or manage daily congestion.
- System automation to monitor congestion and select action plans.
- Real-time action control changes to traffic signal and ramp meter timing to better manage traffic entering or exiting the freeway system and manage traffic signals across agencies.

As part of the ongoing ICM project, a coordinated detour messaging system was activated in April 2016 with alternate route signs installed on surface streets along the I-15 corridor in the cities of Escondido, Poway, and San Diego. With the use of Caltrans overhead changeable message signs on I-15, the ICM provided the congestion management tools to direct motorists off the freeway to avoid delays, and provide alternate route to help guide motorists through surface streets and back onto the freeway as soon as possible (USDOT 2025). The ICM pilot project served as an early generation Advance Transportation and Congestion Management Technologies Deployment concept (ATCMTD) for the San Diego region. SANDAG is leveraging its technical, institutional, and operational lessons learned from the ICM pilot to develop a next generation ICM concept through the implementation of the Regional Border Management System (RBMS). This next generation will include tolling, and situational transportation conditions command and control for cross border traffic as part of SANDAG's planned new State Route 11/Otay Mesa East Land Port of Entry project.

Shared Mobility

Shared mobility options for carpooling and on-demand rideshare have increased in usage over the past decade. On-demand rideshare services are made possible by smartphone applications that allow users to request a ride in real time. The application-based services connect riders with drivers or other riders and facilitate the most efficient trips to their destinations.

- **Dynamic carpooling:** Application-based service that matches drivers with empty seats to passengers seeking rides to similar destinations. This ridesharing service creates efficiency and reduces congestion but does not allow the users to make a profit. Scoop is an example of dynamic carpooling services that is available within the San Diego Region.
- **Ride-hailing services:** Application-based services that allow users to request a ride from paid drivers, who generally use their personal vehicles. Ride-hailing services are presented in a variety of ways, including "pooling" services that connect multiple riders to shared rides, or individual rides, which pick up and drop off riders at designated destinations. Uber and Lyft are the main ride-hailing services operating in the San Diego region.
- **Carshare:** Application-based service that allows for the short-term rental of a fleet vehicle or a personal vehicle via a smartphone app. Round-trip carshares allow users to pick-up and return a vehicle to the same parking spot, while free-floating carshare services allow users to pick-up and drop-off vehicles anywhere within a designated service area. These types of services allow rentals by the hour or day. Peer-to-peer carshare services allow private vehicle owners to rent their car to users within their community. Zipcar and Getaround are the only publicly available carshare services currently operating in the San Diego region.

4.16.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

US Department of Transportation Regional Transportation Plan Requirements

Under federal transportation law, the US Department of Transportation requires that metropolitan planning organizations (MPOs), such as SANDAG, prepare long-range regional transportation plans (23 US Code [USC] 134). In federally designated air quality nonattainment or maintenance areas, the long-range transportation plan is

to be updated at least every 4 years. The proposed Plan would be the latest update of the San Diego region's long-range transportation plan.

Federal requirements for long-range transportation plans include the following (23 USC 134[i][2]):

- **Identification of transportation facilities:** An identification of transportation facilities (including major roadways, public transportation facilities, intercity bus facilities, multimodal and intermodal facilities, nonmotorized transportation facilities, and intermodal connectors) that should function as an integrated metropolitan transportation system, giving emphasis to those facilities that serve important national and regional transportation functions.
- **Performance measures and targets:** A description of the performance measures and performance targets used in assessing the performance of the transportation system.
- **System performance report:** A system performance report and subsequent updates evaluating the condition and performance of the transportation system with respect to the performance targets, including progress achieved by the MPO in meeting the performance targets in comparison with system performance recorded in previous reports.
- **Mitigation activities:** A discussion of types of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the plan. The discussion must be developed in consultation with federal, state, and tribal wildlife, land management, and regulatory agencies.
- **Financial plan:** A financial plan that demonstrates how the adopted transportation plan can be implemented, indicates resources from public and private sources that are reasonably expected to be made available to carry out the plan, and recommends any additional financing strategies for needed projects and programs. For the purpose of developing the transportation plan, the MPO, transit operator, and state must cooperatively develop estimates of funds that will be available to support plan implementation.
- **Operational and management strategies:** Operational and management strategies to improve the performance of existing transportation facilities to relieve vehicular congestion and maximize the safety and mobility of people and goods.
- **Capital investment and other strategies:** Capital investment and other strategies to preserve the existing and projected future metropolitan transportation infrastructure, provide for multimodal capacity increases based on regional priorities and needs, and reduce vulnerability of the existing transportation infrastructure to natural disasters.
- **Transportation and transit enhancement activities:** Proposed transportation and transit enhancement activities including consideration of the role that intercity buses may play in reducing congestion, pollution, and energy consumption in a cost-effective manner and strategies and investments that preserve and enhance intercity bus systems, including systems that are privately owned and operated.

Also, regional transportation plans (RTPs) must be financially realistic (i.e., account for revenue constraints), balancing capital and operating costs with reasonable revenue expectations, as agreed upon by MPOs and their transportation agency partners in the planning process (23 Code of Federal Regulations [CFR] 450.324).

Additionally, in metropolitan areas that are in nonattainment for ozone or carbon monoxide under the federal Clean Air Act (CAA), the MPO must coordinate the development of a transportation plan with the process for development of the transportation control measures of the State Implementation Plan required by the CAA. In each metropolitan area, the MPO must consult, as appropriate, with state and local agencies responsible for land use management, natural resources, environmental protection, conservation, and historic preservation concerning the development of a long-range transportation plan. Each MPO must provide individuals, affected public agencies, representatives of public transportation employees, public ports, freight shippers, providers of freight transportation services, private providers of transportation, representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the

disabled, and other interested parties with a reasonable opportunity to comment on the transportation plan. A transportation plan involving federal participation must be published or otherwise made readily available by the MPO for public review.

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

Road Repair and Accountability Act of 2017

SB 1, also referred to as the Road Repair and Accountability Act of 2017, was signed into law on April 28, 2017, increasing transportation funding and instituting reforms. SB 1 includes an annual investment of $5.4 billion to repair roads, freeways, and bridges in communities throughout the state. SB 1 is intended to address a backlog of repairs and upgrades to the state's transportation facilities, while simultaneously ensuring a sustainable travel network for the future. Funds from SB 1 are split equally between state and local investments.

Active Transportation Program

Pursuant to SB 99 (Chapter 359, Statutes of 2013) and AB 101 (Chapter 354, Statutes of 2013), the Active Transportation Program (ATP) was created to encourage increased use of active modes of transportation, such as biking and walking. The ATP consolidates various federal and state transportation programs, including the Transportation Alternatives Program, Bicycle Transportation Account, and State Safe Routes to School, into a single program with a focus to make California a national leader in active transportation (Caltrans 2025b). The ATP is administered jointly by the California Transportation Commission (CTC) and Caltrans and combines many federal and state funding streams previously used for bicycle, pedestrian, safety, and other related purposes into one funding stream. In 2017, the Road Repair and Accountability Act (SB 1) added approximately $100 million per year in additional funds for the program (SANDAG 2018a). The purpose of the ATP includes the following objectives:

- increase the proportion of biking and walking trips;
- increase safety for nonmotorized users;
- increase mobility for nonmotorized users;
- advance the efforts of regional agencies to achieve greenhouse gas–reduction goals;
- enhance public health, including the reduction of childhood obesity through the use of projects eligible for Safe Routes to Schools Program funding;
- ensure disadvantaged communities fully share in program benefits (25 percent of program); and
- provide a broad spectrum of projects to benefit many types of active transportation users.

California RTP Requirements

Every Metropolitan Planning Organization (MPO) is required by federal regulation (49 USC. 5304(f) and 23 CFR 450(b)) and California statute (Government Code (GC) Section 65080) to conduct long range planning to ensure that the region's transportation vision and goals are clearly identified and to ensure effective decision making in furtherance of the vision and goals. The long-range plan, known as the RTP or Metropolitan Transportation Plan (MTP), is an important planning and policy document that is based on the unique needs and characteristics of a region. The RTP impacts a region's economy, environment, public health, safety, and social equity, along with communicating a regional vision to the State and federal government.

The California Transportation Commission (CTC) updated the Regional Transportation Plan Guidelines in January 2024 (CTC 2024). The purposes of these RTP Guidelines are to: 1) Promote an integrated, statewide, multimodal, regional transportation planning process and effective transportation investments; 2) Set forth a uniform transportation planning framework throughout California by identifying federal and State requirements and statutes impacting the development of RTPs; 3) Promote a continuous, comprehensive, and cooperative transportation planning process that facilitates the rapid and efficient development and implementation of

projects that maintain California's commitment to public health and environmental quality; and 4) Promote a planning process that considers the views of all stakeholders.

Senate Bill 375

SB 375 (Chapter 728, Statutes of 2008) requires California's MPOs to prepare a Sustainable Community Strategy (SCS) that demonstrates how the region will meet regional GHG-reduction targets through integrated land use, housing, and transportation planning. In 2010, the California Air Resources Board (CARB) established per capita regional GHG reduction targets for passenger vehicles to be met by 2020 and 2035. These targets were updated in 2018. For the San Diego region, the updated targets are 15 percent below 2005 levels in 2020 and 19 percent below 2005 levels in 2035.

The SCS is incorporated into the MPO's RTP. CARB must review the SCS to determine if it would enable the MPO to meet regional GHG-reduction targets once implemented.

Assembly Bill 1358 – California Complete Streets Act

AB 1358, the Complete Streets Act (Government Code Sections 65040.2 and 65302), was signed into law in September 2008. As of January 1, 2011, the law required cities and counties, when updating the part of a local general plan that addresses roadways and traffic flows, to ensure that those plans account for the needs of all roadway users. Specifically, the legislation requires cities and counties to ensure that local roads and streets adequately accommodate the needs of bicyclists, pedestrians, and transit riders, as well as motorists.

California Bicycle Transportation Act

The California Bicycle Transportation Act was enacted in 1994 to establish a bicycle transportation system that is designed and developed to achieve the functional commuting needs of employees, students, businesspeople, and shoppers. The bicycle transportation system should take into consideration route selection, the physical safety of the bicyclist and their property as a major planning component, and the capacity to accommodate bicyclists of all ages and skills. As defined in the California Bicycle Transportation Act, bikeways are categorized as Class I, Class II, Class III, or Class IV facilities. Additionally, the California Bicycle Transportation Act requires Caltrans, in cooperation with county and city governments, to establish minimum safety design criteria for each bikeway classification and roadways where bicycle travel is permitted, and also requires Caltrans to establish uniform specifications and symbols for signs, markers, and traffic control devices to designate bikeways, regulate traffic, improve safety and convenience for bicyclists, and alert pedestrians and motorists of the presence of bicyclists. Furthermore, the Act requires all cities and counties to have an adopted bicycle master plan to apply for Bicycle Transportation Account funding.

Senate Bill 743

SB 743 (Steinberg) was signed into law by Governor Jerry Brown on September 27, 2013, and encourages development of mixed-use, transit-oriented infill projects by (1) establishing new CEQA exemptions for transit-oriented developments located in transit priority areas (TPAs) that are consistent with an adopted specific plan; (2) eliminating the requirement to evaluate aesthetic and parking impacts in those targeted development areas, and (3) directing the Governor's Office of Planning and Research (OPR) (now known as the Governor's Office of Land Use and Climate Innovation) to develop an alternative metric to evaluate transportation-related impacts under CEQA.

SB 743 exempts from CEQA, a residential, employment center, or mixed-use development project, including any subdivision, or any zoning, change that meets all of the following criteria:

1. The project is proposed within a TPA.
2. The project is undertaken to implement and is consistent with a specific plan for which an environmental impact report has been certified.
3. The project is consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy accepted by CARB.

Furthermore, "[a]esthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment." However, the exemption for aesthetic impacts does not include impacts on historic or cultural resources. Local governments retain their ability to regulate a project's transportation, aesthetics, and parking impacts outside of the CEQA process pursuant to local design review ordinances or other discretionary powers.

For infill development, including transit-oriented development, SB 743 provides a rationale for the development of a new metric to evaluate CEQA transportation impacts. Prior to SB 743, CEQA transportation impacts were primarily assessed (at least at the project level) through level of service and other congestion or delay-based analyses, which focused exclusively on motor vehicle delay. This often penalizes infill and active transportation projects. SB 743 establishes that the new transportation impact analysis methodology should appropriately balance the needs of congestion management with statewide goals related to transit-oriented mixed-use infill development, promotion of public health through active transportation, and reduction of GHG emissions.

SB 743 also directed OPR to identify appropriate criteria for the evaluation of transportation impacts in CEQA Guidelines amendments, and provided that once these amendments are adopted, automobile delay, as measured by "level of service" and other similar metrics, no longer constitutes a significant environmental effect under CEQA. OPR selected VMT as the preferred transportation impact metric and applied its discretion to require its use statewide for land use projects and to recommend its use for transportation projects. The revised CEQA Guidelines that implement SB 743 became effective on December 28, 2018, and indicate in CEQA Guidelines Section 15064.3 that VMT is the basis for evaluation of transportation impacts for land use projects. The revised guidelines state that, except as provided in Section 15064.3(b)(2) for roadway capacity projects, a project's "effect on automobile delay shall not constitute a significant environmental impact," although automobile delay may still be appropriate for evaluation of projects as part of the planning process. For roadway capacity projects, the CEQA Guidelines specify that agencies have discretion to determine the appropriate measure of transportation impacts consistent with CEQA and other applicable requirements.

In December 2018, OPR issued a technical advisory on implementing SB 743 requirements, including recommendations for VMT thresholds of significance for certain types of land use projects (OPR 2018). Also, Caltrans has issued guidance on how to evaluate VMT impacts of land use projects affecting the state highway system and state highway system transportation projects (Caltrans 2020a).

Public Resources Code Section 30253

Public Resources Code Section 30253, Part 4, establishes a policy that development within the coastal zone must minimize energy consumption and VMT.

Assembly Bill 2731

AB 2731 of 2020 authorizes SANDAG to obtain site control to support the redevelopment of the Old Town Center site, including a transit and transportation facilities project, in the city of San Diego before completing the environmental review for those actions. Requirements of CEQA for transit-oriented development projects occurring at the Old Town Center site that meet certain requirements are satisfied by a specific environmental impact statement prepared by the US Department of the Navy. Further environmental review for transit-oriented development projects is to be conducted only if certain events occur.

California Transportation Plan 2050

The California Transportation Plan 2050 (CTP 2050) provides a common framework for guiding transportation decisions and investments by all levels of government and the private sector. Statutorily mandated federal and state law require that Caltrans facilitate, develop, and prepare the CTP. The development of the CTP 2050 was a multi-year effort involving cross-sector coordination with State, regional, and local partners; extensive research; public engagement; technical analysis; and oversight from multiple committees. The CTP 2050 builds on concurrent efforts included in Caltrans' planning documents, RTPs, other statewide plans and studies such as the 2017 Climate Change Scoping Plan, Strategic Highway Safety Plan, and Statewide Housing Assessment. It also draws from research on demographic shifts, technology trends, and economic growth to help inform where the

state is headed, what strategies can be employed, and what challenges and opportunities the state may face along the way. To evaluate future conditions and plan benefits, the CTP 2050 employed a suite of technical tools and models to help inform policy-decision making. Caltrans will continue to work with stakeholders and the public to update the CTP every five years (Caltrans 2021a).

The California Freight Mobility Plan

The California Freight Mobility Plan (CFMP) is a comprehensive plan that governs the immediate and long-range planning activities and capital investments by the state with respect to freight movement. The plan summarizes the ongoing state of freight in California and makes recommendations on further investments in freight mobility. The plan details short- and long-term policies, strategies, and investments, with a focus on trucking, including parking, truck-only lanes, tolling, and autonomous trucks.

The CFMP also complies with California State Government Code Section 13978.8(b)(1) (Assembly Bill 14, Lowenthal) and the provisions of United States Code 49 USC 70202: State freight plans (Infrastructure Investment and Jobs Act, or IIJA), which requires each state that receives funding under the National Highway Freight Program to develop a State Freight Plan every four years (Caltrans 2023).

California Highway Design Manual

The *California Highway Design Manual* (HDM) is published by Caltrans and establishes uniform policies, procedures, and standards to carry out the freeway and state highway design functions within the state (Caltrans 2020b). The HDM also provides guidance, policies, and standards for the design of bicycle facilities.

California Manual on Uniform Traffic Control Devices

The *California Manual on Uniform Traffic Control Devices* (California MUTCD) is published by the State of California/Caltrans and is issued to adopt uniform standards and specifications for all official traffic control devices in California, in accordance with Section 21400 of the California Vehicle Code (Caltrans 2020c). The California MUTCD incorporates the US Federal Highway Administration's *Manual on Uniform Traffic Control Devices* and incorporates all policies on traffic control devices issued by Caltrans.

Assembly Bill 130

Assembly Bill 130 (AB 130) was signed in to law in June 2025. The bill primarily focuses on the incentivizing infill housing development within urban areas by exempting them from CEQA. AB 130 also requires that the California Governor's Office of Land Use and Climate Innovation (LCI) develop a mitigation fee program that allows projects to mitigate their associated VMT related impacts by paying a fee to fund transit-oriented development and affordable housing throughout the state. The fees will be deposited into a fund administered by the Department of Housing and Community Development (HCD) that will fund VMT reducing projects, including "affordable housing or related infrastructure projects, including infrastructure necessary for higher density uses." LCI is required to issue initial guidance for using this new mitigation by July 1, 2026, and issue subsequent guidance at least once every three years, which includes starting the rulemaking process for any subsequent guidance by January 1, 2028.

Strategic Highway Safety Plan

The California Strategic Highway Safety Plan (SHSP) is a comprehensive, statewide transportation safety plan which provides a collaborative framework for reducing fatalities and serious injuries across all travel modes and on all public roads. The SHSP utilizes a data-driven process to identify key safety needs and guides resource and investment decisions that provide the greatest potential to achieve the plan's goal of zero traffic fatalities and serious injuries on all of California's public roadways. Per the Federal Highway Administration, "A Strategic Highway Safety Plan (SHSP) is a major component and requirement of the Highway Safety Improvement Program (HSIP) (23 USC. § 148). It is a statewide-coordinated safety plan that provides a comprehensive framework for reducing highway fatalities and serious injuries on all public roads. (Caltrans 2020b).

LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

TransNet Extension Ordinance and Expenditure Plan

In 2008, 67 percent of San Diego County voters approved the *TransNet* Extension Ordinance and Expenditure Plan (Commission Ordinance 04-01) to extend to 2048 the half-cent sales tax for regionwide transportation improvements originally approved in 1987 (Commission Ordinance 87-1). The revenues must be used solely for the improvements identified in the Expenditure Plan for the extension ordinance. SANDAG allocates the revenues in its capacity as the San Diego County Regional Transportation Commission.

The Expenditure Plan identifies capital improvements for highways (Express Lane/high-occupancy vehicle lanes and general purpose lanes), capital improvements and operations and maintenance support for rail transit and bus rapid transit, local bus and senior and disabled transportation services, local streets and roads, bicycle and pedestrian facilities, transportation-related community infrastructure to support smart growth development, environmental mitigation and enhancement projects, and administrative expenses, including an Independent Taxpayer Oversight Committee. When allocating revenues, the extension ordinance requires that SANDAG "shall make every effort to maximize State and federal transportation funding to the region" (Section 5[C]). Projects receiving *TransNet* funds are required to accommodate travel by pedestrians and bicyclists in accordance with the best available standards and guidelines (Section 4[E][3]).

Section 16 of the extension ordinance describes the process for amending the Expenditure Plan. Amendments to the Environmental Mitigation Program (Section 2[D]) and projects included in the Expenditure Plan for the original ordinance in 1987 that remain uncompleted (e.g., State Route 76 East Segment and the Mid-Coast Corridor Transit Project) require approval by the voters of San Diego County. Other provisions requiring voter approval to be amended relate to imposition of the half-cent sales tax (Section 3), maintenance of effort requirements for local revenues (Section 8), the regional transportation congestion improvement program (Section 9), and the Independent Taxpayer Oversight Committee (Section 11). Other provisions may be amended by a two-thirds vote of the SANDAG Board of Directors (Board). Section 5 of the extension ordinance provides that the Expenditure Plan must be amended as necessary to maintain consistency with the RTP.

Designing for Transit

The *Design for Transit: A Manual for Integrating Public Transportation and Land Development in the San Diego Metropolitan Area* is published by MTS (2018). The manual is designed to help planners, developers, architects, and engineers understand the physical requirements of public transportation. The manual provides specific design standards for public transportation facilities, including bus and light-rail transit within the San Diego region. The manual also recommends measures that can improve transit service and enhance safe access to transit on local streets through Complete Streets design strategies.

Amended 2021 Regional Plan

The Amended 2021 Regional Plan is a 30-year plan that serves as both the long-range RTP and SCS for the San Diego region. (It will be replaced by the 2025 Regional Plan.) The Amended 2021 Regional Plan must comply with specific state and federal mandates, including an SCS, per SB 375 (Steinberg 2008), that achieves GHG emission reduction goals set by CARB; compliance with federal civil rights requirements (Title VI); and environmental justice considerations, air quality conformity, and a public participation process. The SANDAG Board adopted the Final Amended 2021 Regional Plan on December 10, 2021 (Amended in October 2023). The following key policies that address the circulation system are included Amended 2021 Regional Plan:

- **Land use and regional growth:** The Amended 2021 Regional Plan vision for land use focuses on development and growth in Mobility Hub areas to preserve the region's open space and support transportation investments by reducing VMT. SANDAG will consider how land use programs, projects, and policies it supports address social equity in relation to regional access to affordable housing, proximity to jobs and transit, opportunities for residents to live where they work and play, convenient access to multimodal transportation options, and other opportunities for work, commerce, and recreation.

- **Transportation demand management:** SANDAG will continue to administer and monitor the Sustainable Transportation Services program by providing regional rideshare, employer outreach, and bike education and secure parking services to help reduce commute-related traffic congestion and VMT. Beyond commute trips, TDM programs are expanded to include grants and incentives that make it easier and safer to use active modes for short trips.

  Vision Zero: Vision Zero is a national campaign to eliminate all traffic-related deaths and serious injuries by focusing on policies and the redesign of streets to create a transportation system that is safe for everyone. Vision Zero utilizes crash data to identify safety issues and recommend solutions, develop a regional safety policy, further construct the regional bike network and build out jurisdictions' complete streets networks, and fund educational programs

- **Fix It First:** Amended 2021 Regional Plan Amended 2021 Regional Plan The Fix It First strategy aims to repair existing roads and create a system for sustained maintenance in the future, creating a safe and efficient transportation network for all users. The Fix It First strategy can help reduce pollution exposure by maintaining infrastructure that facilitates use of efficient routes and does not neglect facilities that could force users to seek inefficient and longer routes. The Fix It First strategy can prioritize funding in disadvantaged communities and places that have not seen investment to maintain older facilities that are in various states of disrepair.

- **Transportation system management and operations:** Transportation system management and operations (TSMO) employs a series of intelligent transportation system strategies designed to maximize the capacity and efficiency of the existing and future transportation system. TSMO includes the establishment of institutional and governance actions to help advance and facilitate cross-agency collaboration to ensure that existing and proposed transportation systems are not operated or managed as independent systems but as a multimodal transportation system. These strategies will help SANDAG manage the complete corridor system in a coordinated way across jurisdictions and operators that include capital and technology investments.

- **Value pricing:** The Amended 2021 Regional Plan incorporates a variety of pricing strategies, including Amended 2021 Regional Plana network of Express Lanes, a fee on the fares charged for rides provided by transportation network companies, and further subsidization of transit fares. Pricing strategies such as these are in different phases of planning, design, pilot, and deployment in different regions and are also being explored at the state and federal level.

The Amended 2021 Regional Plan was amended in October 2023 to remove the Road Usage Charge component of the plan.

Regional Transportation Improvement Program

The Regional Transportation Improvement Program (RTIP) is a 5-year program of major transportation projects funded by federal, state, *TransNet* local sales tax, and other local and private funding and also includes proposed local streets and roads projects. The Final 2025 RTIP (SANDAG 2024a) covers five fiscal years (FY 2025 through FY 2029) and incrementally implements the Amended 2021 Regional Plan. The SANDAG Board adopted the 2025 RTIP on September 27, 2024. The Federal Highway Administration and Federal Transit Administration approved the 2025 RTIP and its air quality conformity determination on December 16, 2024. SANDAG consulted with local jurisdictions through public meetings of the various SANDAG committees and working groups that are responsible for the development and oversight of the projects. These committees include the Transportation Committee, the Cities/County Transportation Advisory Committee, the Social Equity Working Group, the Interagency Technical Working Group on Tribal Transportation Issues, the Independent Taxpayer Oversight Committee, and the San Diego Region Conformity Working Group.

San Diego and Imperial Counties Sustainable Freight Implementation Strategy

The San Diego and Imperial Counties Sustainable Freight Implementation Strategy (Sustainable Freight Strategy) analyzes and prioritizes innovative strategies for implementation to improve the efficiency and sustainability of goods within the San Diego Association of Governments (SANDAG) and Imperial County Transportation Commission (ICTC) region. The report outlines the analysis of the system's existing conditions and proposes

several key strategies for implementation. While these key strategies serve as a baseline for improving the supply chain network, additional innovative strategies have been assessed and outlined for implementation for future scenarios. The goal of the Sustainable Freight Strategy is to create a more sustainable supply chain network through regional freight projects and policies that reduce emissions while fostering trade. The objectives of the Sustainable Freight Strategy include the following: develop partnerships with public and private sectors, address environmental justice concerns from freight impacts, pilot innovative technologies, identify funding opportunities for implementation, and address workforce gaps in implementing new technologies (SANDAG 2024b).

Regional Active Transportation Network in the 2025 Regional Plan

An update to the Regional Active Transportation Network is included in the 2025 Regional Plan to improve safety and mobility for people who travel the region by foot, bike, scooter, transit, or other means outside of a car. Projects are sited along corridors identified within the last adopted Regional Bike Plan (2010), the 2013 Early Action Program (EAP) projects, local jurisdictions' plans, Comprehensive Multimodal Corridor Plans (CMCPs), Safety Focus Network, Systemic Safety Network, or existing bikeways. This updated network is comprised of nearly 600 miles of bikeways first included in San Diego Forward the 2015 Regional Plan, combined with approximately 300 additional miles of bikeways as accounted for in subsequently adopted planning efforts including local jurisdiction plans and regional comprehensive multimodal corridor plans. The updated network features 182 miles of Existing/In Construction Bikeways, and 721 miles of Planned Bikeways totaling 903 miles of Regional Active Transportation Network. The breakdown of the network by facility type is: 162 miles of off-street bikeways, 517 miles of on-street bikeways, and 224 miles of bikeways featuring a mix of on and off-street facilities

Riding to 2050 – San Diego Regional Bike Plan

Riding to 2050 — San Diego Regional Bicycle Plan (Riding to 2050) (SANDAG 2010a) establishes the plan for the regional bicycle system within the San Diego region and was adopted by the Board in April 2010. The plan is intended to guide the development of the regional bicycle system through the year 2050. Riding to 2050 outlines a range of recommendations to facilitate accomplishing the following regional goals:

- Increase the number of people who bike and frequency of bicycle trips for all purposes.
- Encourage the development of Complete Streets.
- Improve safety for bicyclists.
- Increase public awareness and support for bicycling in the San Diego region.

Riding to 2050 includes recommendations for bicycle infrastructure improvements, bicycle-related programs, implementation strategies, and policy and design guidelines (SANDAG 2010a).

Riding to 2050 presents an interconnected network of bicycle corridors that would enable residents to bicycle with greater safety, directness, and convenience within and between major regional destinations and activity centers. While bicycle planning and policy-making is primarily focused on the local level, Riding to 2050 provided an opportunity to improve regional coordination and connectivity of bicycle facilities between jurisdictions. The network selection and classification process included on-going consultation with the SANDAG Bicycle-Pedestrian Working Group, which was composed of staff from each of the 19 local jurisdictions. (SANDAG 2010b.)

On September 27, 2013, the Board approved the Regional Bike Plan Early Action Program (Bike Plan EAP) (SANDAG 2018b)—a $200 million initiative to expand the Regional Bike Network regionwide and finish high-priority projects within a decade. The adopted Bike Plan EAP comprises 38 projects, totaling roughly 77 miles of new bikeways that will make it much easier for people to ride their bikes to school, work, transit stations, and other major destinations. The Bike Plan EAP is funded by *TransNet*, the regional half-cent sales tax for transportation approved by San Diego County voters. *TransNet* funding will be leveraged to bring in state and federal dollars so that the region can complete more bike projects and reap even greater economic, health, and mobility benefits.

SANDAG Vision Zero Action Plan

In November 2022, the SANDAG Board of Directors adopted a resolution acknowledging the critical role SANDAG plays in implementing safe streets across the region. With this resolution, SANDAG affirmed that traffic-related deaths and serious injuries are preventable and directed staff to develop an action-oriented plan to reduce or eliminate fatal and serious injury crashes. The Vision Zero Action Plan outlines the SANDAG approach for reaching the Vision Zero goal by 2050. This Action Plan details a multi-layered approach for supporting traffic safety in the region and advancing Vision Zero goals at the local government level. The successful outcome of this plan is a regional road network that allows everyone—regardless of whether they walk, bike, roll, drive, or ride transit—to arrive at their destinations safely whenever they travel. The Vision Zero Action Plan was adopted in November 2024 (SANDAG 2024c).

Parking Strategies for Smart Growth

SANDAG developed a *Parking Strategies for Smart Growth* guide as part of its Planning Tools for the San Diego Region (SANDAG 2010b). This guide provides a benchmark and compares the various parking regulations within the region, as well as how those regulations compare to national standards. Additionally, the guide provides example policies on how jurisdictions can implement smart growth parking policies and programs. SANDAG also developed a regional parking management toolbox that provides jurisdictions within the San Diego region with a framework for evaluating, implementing, and managing parking management strategies that support their economic development, sustainability, and mobility goals (SANDAG 2014).

SANDAG's Sustainable Transportation Services program, which focuses on transportation demand management (TDM) strategies, also contains parking management programs and opportunities that employers and jurisdictions can use to better manage their parking demand. The sustainable transportation services program currently offers vanpool/carpool assistance, ride-matching programs, and telework programs to assist employers with transportation and parking demand management.

Regional Safe Routes to School Strategic Plan

In September 2010, SANDAG began engaging key stakeholders and the region's residents in the development of the Draft Regional Safe Routes to School Strategic Plan; the final Strategic Plan was accepted by the SANDAG Transportation Committee on March 2, 2012. The Regional Safe Routes to School Strategic Plan aims to make walking and bicycling to school safer and to provide more attractive travel choices for families throughout the region. The plan identifies a regional strategy to support local communities in establishing new Safe Routes to School programs, as well as sustaining and enhancing existing efforts (SANDAG 2012).

Improving safety conditions is a central goal of Safe Routes to School programs, which can be accomplished by improving the built environment, educating students, engaging community members, enforcing traffic laws, and instituting programs designed to address personal security concerns. Safe Routes to School programs support more sustainable, compact, well-designed communities interconnected by a transportation system that expands travel choices and reduces GHG emissions. Safe Routes to School programs also help achieve this vision by reducing peak-period vehicle trips and providing active transportation to school with more viable and attractive options. Addressing school safety and accessibility improves the overall walkability of affected neighborhoods (SANDAG 2012).

General Plan Circulation Elements

As mandated by state law, general plans must have a circulation element (sometimes referred to as a transportation or mobility element) that is consistent with all other elements of the general plan (Government Code Section 65302). Circulation elements describe the individual jurisdictions' transportation system, including roadways as well as public transit, pedestrian, and bicycle facilities, and outline goals and policies. Circulation elements and their compatibility with land use plans are an important part of overall regional transportation planning, because each general plan works to harmonize local land uses and development patterns with transportation goals and needs. The planning horizon for local general plans is often between 15 and 20 years. In the San Diego region, there are 19 general plans prepared by individual jurisdictions.

Comprehensive Multimodal Corridor Plans

Comprehensive Multimodal Corridor Plans (CMCPs) are designed to reduce vehicle miles traveled and greenhouse gas emissions, and identify mobility solutions in our region's busiest travel corridors. CMCPs are one of the strategies SANDAG is using to carry out the Amended 2021 Regional Plan and inform the development of the 2025 Regional Plan, SANDAG's blueprint for enhancing the region's quality of life through equitable, sustainable, and accessible transportation.

CMCPs are data driven and analyze demographics, employment centers, economics, and travel patterns to help SANDAG and Caltrans make informed decisions on strategies and funding in major travel corridors throughout the region. The goal is to reduce congestion in highly traveled corridors by providing more transportation choices for residents, commuters, visitors, and commercial cargo, while also preserving the local community's social character and creating opportunities for neighborhood enhancement projects.

As part of California Senate Bill 1, the Road Repair and Accountability Act of 2017, CMCPs must be completed for the region to be eligible to compete for certain state and federal funding and grant opportunities for future transportation improvements (SANDAG 2025b).

4.16.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts in the form of initial study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the CEQA Guidelines Appendix G checklist questions. Checklist questions for transportation are provided in Section XVII of CEQA Guidelines Appendix G. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document to develop significance criteria that reflect the programmatic level of analysis in this EIR, and the unique characteristics of the proposed Plan. Notably, Appendix G, Section XVII, question (d) regarding whether the proposed Plan would result in inadequate emergency access is addressed under HAZ-4 in Section 4.9, "Hazards and Hazardous Materials."

For purposes of this EIR, implementation of the proposed Plan would have a significant transportation impact if it would:

TRA-1 Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

TRA-2 Conflict or be inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals.

TRA-3 Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses.

TRA-4 Lead to a lack of parking supply that would cause significant secondary environmental impacts not already analyzed in other resource chapters of this EIR. (Note: This question is not included in the Appendix G checklist questions.)

The analysis discloses transportation impacts. There is insufficient evidence to support a meaningful analysis of how the proposed Plan's transportation impacts would be worsened by climate change. Therefore, a climate change analysis for transportation impacts is not included in this section.

4.16.4 Environmental Impacts and Mitigation Measures

TRA-1 CONFLICT WITH A PROGRAM, PLAN, ORDINANCE, OR POLICY ADDRESSING THE CIRCULATION SYSTEM, INCLUDING TRANSIT, ROADWAY, BICYCLE, AND PEDESTRIAN FACILITIES.

Analysis Methodology

The emphasis of the analysis is on plan inconsistency and conflicts between the proposed Plan's transportation network improvements and programs, and existing applicable regional programs, plans, ordinances, or policies addressing the circulation system and on whether any inconsistencies would result in significant environmental effects compared to existing conditions. The proposed Plan is considered consistent with the provisions of the identified regional plans if it meets the general intent of the applicable plans. The regulatory setting provides a brief overview of the relevant regional planning documents and their primary goals. However, the proposed Plan consistency conclusions are based upon the planning documents as a whole.

Because the proposed Plan identifies and proposes transportation network improvements at a regional level, plan consistency was reviewed against other regional plans and policies. Because of the close relationship between forecasted regional growth and land use change and planned transportation network improvements and programs on travel behavior, this section analyzes their combined effect, instead of separate analyses for regional growth and land use change and transportation network improvements and programs.

SB 375 requires RTPs to use "the most recent planning assumptions considering local general plans and other factors." Therefore, it can be assumed the proposed Plan would generally be consistent with transportation programs, plans, ordinances, and policies of the individual jurisdictions in the region.

This analysis reviews the proposed Plan against the Amended 2021 Regional Plan and Riding to 2050 plan, presented in additional detail in Section 4.16.2, "Regulatory Setting," to determine if there are any conflicts. Both plans were developed with and reflect extensive local jurisdiction planning input.

To determine if the proposed Plan is consistent with the programs, plans, policies, and ordinances contained in the current regional planning documents, the infrastructure and demand for each mode (transit, vehicular, pedestrian, and bicycle) were compared to baseline year 2022 conditions. If the proposed Plan is shown to be consistent with the policies contained in Amended 2021 Regional Plan and Riding to 2050, it is assumed to be consistent with the current planning documents and have a less-than-significant impact.

The impact analysis considers consistency of the proposed Plan's transportation network improvements and programs, but not the proposed Plan's regional growth and land use change, with the transportation content of the Amended 2021 Regional Plan and Riding to 2050. This approach is taken because the Impact TRA-1 significance criterion is limited to "circulation system "(i.e., transportation) issues.

Impact Analysis

2035

Transportation Network Improvements and Programs

Table 4.16-5 outlines the transportation network and projected travel demand, by mode, under proposed Plan Year 2035 conditions. Proposed Plan Year 2035 conditions are compared to Baseline Year 2022 conditions to identify how the implementation of the plan would affect the transportation network and transportation demand throughout the San Diego Region.

Table 4.16-5 Transportation System Analysis – Year 2035

Mode	Category	Baseline Year 2022	Year 2035 Proposed Plan	Change from Baseline Year 2022
Transit	Miles of Transit Service	107,875	328,229	220,354
	Commuter Rail	2,197	4,393	2,196
	Light Rail Transit	15,416	24,507	9,092
	Rapid	13,104	144,186	131,081
	Bus	77,158	155,143	77,985
	Population within TPAs	786,769	1,885,975	1,099,206
	Employment within TPAs	739,664	1,531,064	791,400
	Service Population within TPAs	1,526,433	3,417,039	1,890,606
	Average Daily Transit Trips	207,582	481,660	274,078
	Transit Mode Share	1.4%	3.2%	1.8%
	Average Length of Transit Trip (miles)	9.2	9.3	0.1
Auto	Miles of Roadways	6,998	7,418	420
	Freeway (includes auxiliary lanes)	2,584	2,752	168
	General Purpose Lanes	2,417	2,465	49
	HOV/Managed Lanes	119	285	166
	Tollway	48	1.87	-46
	State Highway	641	642	1
	Regional Arterials	3,773	4,024	251
	Average Daily Vehicle Trips	13,146,382	13,754,857	608,474
	HOV Trips	2,047,292	2,006,805	-40,487
	Auto Mode Share	79.2%	76.0%	-3.2%
	Average Length of Vehicle Trip (miles)	6.7	6.9	0.2
	SB743 VMT per Resident	16.7	15.9	-0.8
	SB743 VMT per Employee[1]	13.0	12.3	-0.7
	VMT Per Service Population[2]	14.4	14.4	0.0
Bicycle	Lane Miles of Bike Facilities	3,420	3,803	383
	Class I	354	520	166
	Class II	2,284	2,036	-248
	Class III	722	629	-93
	Class IV	45	501	456
	Bike Boulevard	15	118	103
	Average Daily Bicycle Trips	208,520	209,896	1,376
	Bicycle Mode Share	1.4%	1.4%	0.0%
	Average Length of Bicycle Trip (miles)	3.7	3.9	0.2
Pedestrian	Average Daily Pedestrian Trips	2,265,441	2,473,834	208,393
	Pedestrian Mode Share	15.3%	16.2%	0.9%
	Average Length of Pedestrian Trip (miles)	0.9	0.9	0.0

[1] VMT per employee accounts for trips from work commute tours & at-work subtours only

[2] Service population includes non-institutionalized population and employment within the area

Source: ABM3, March 2025.

The metrics outlined in Table 4.16-5 show that the proposed Plan is consistent with the circulation system policies outlined in the Amended 2021 Regional Plan and Riding to 2050, and therefore, do not conflict with them:

Amended 2021 Regional Plan

- *Land Use and Regional Growth*. Implementation of the proposed Plan would increase transit ridership, as well as the number of walking and biking trips within the proposed Plan region; showing that it will provide convenient access to multi-modal travel options, as prescribed by the policy. Additionally, the proposed Plan would increase the total service population within TPAs; thus, increasing the proximity of jobs and residents to transit opportunities, as prescribed by the policy. Therefore, the proposed Plan is consistent with the portions of this policy that relate to the circulation system.
- *Parking and Curb Management*. The proposed Plan includes system wide investments towards parking and curb management strategies that are included in the Amended 2021 Regional Plan. Parking management strategies have been included in the proposed Plan's Transportation Demand Management Policy. Therefore, the proposed Plan is consistent with this policy.
- *Transportation Demand Management*. The proposed Plan includes similar policy language and Transportation Demand Management strategies and programs to the Amended 2021 Regional Plan. Additionally, as shown in Table 4.16-5, implementation of the proposed Plan would reduce the vehicular mode share within the region by 3.2 percentage points, maintaining one of the intents of this policy by reducing the number of single-occupant vehicle trips within the region. Therefore, the proposed Plan is consistent with this policy.
- *Vision Zero*. The proposed Plan includes similar policy language and Vision Zero based transportation network improvements, strategies, and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Fix It First*. The proposed Plan includes similar policy language and Fix It First strategies and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Transportation System Management and Operations*. The proposed Plan includes similar policy language and Transportation System Management and Operations strategies and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Value Pricing*. The proposed Plan will maintain the managed lanes, fees charged to Transportation Network Companies, and transit subsidy programs included within the policy. Therefore, the proposed Plan is consistent with this policy.

The proposed Plan is also consistent with the following goals from Riding to 2050:

- *Increase the number of people who bike and frequency of bicycle trips for all purposes*. As shown in Table 4.16-5, implementation of the proposed Plan would increase bicycle ridership within the region by 1,376 daily trips under Year 2035 conditions.
- *Improve safety for bicyclists*. As shown in Table 4.16-5, the proposed Plan would increase the total number of protected and separated bicycle facilities within the region (Class I and Class IV facilities). These facilities provide cyclists their own right-of-way within the roadway and reduce the number of conflicts with vehicular traffic, resulting in safer conditions.

2035 Conclusion

Under Year 2035 conditions, the proposed Plan would implement over 383 additional lane miles of bicycle facilities and over 220,000 additional miles of transit service within the region. The proposed Plan would also increase the number of bicycle, pedestrian, and transit trips generated within the region, while reducing the vehicular mode share from 79.2 percent to 76.0 percent, compared to Baseline Year 2022 conditions. These characteristics of the proposed Plan are generally consistent with the policies outlined in the Amended 2021 Regional Plan and Riding to 2050 and therefore, the proposed Plan would not conflict with them. Additionally, the policy language and goals in the proposed Plan and the Amended 2021 Regional Plan are similar. Therefore, implementation of the proposed Plan, under Year 2035 conditions, would result in a less-than-significant impact.

2050

Transportation Network Improvements and Programs

Table 4.16-6 outlines the transportation network and projected travel demand, by mode, under proposed Plan Year 2050 conditions. Proposed Plan Year 2050 conditions are compared to Baseline Year 2022 conditions to identify how the implementation of the plan would affect the transportation network and travel demand throughout the San Diego Region.

Table 4.16-6 Transportation System Analysis – Year 2050

Mode	Category	Baseline Year 2022	Year 2050 Proposed Plan	Change from Baseline Year 2022
Transit	Miles of Transit Service	107,875	334,227	226,353
	Commuter Rail	2,197	4,030	1,833
	Light Rail Transit	15,416	34,401	18,985
	Rapid	13,104	142,154	129,050
	Bus	77,158	153,643	76,485
	Population within TPAs	786,769	1,919,031	1,132,262
	Employment within TPAs	739,664	1,623,552	883,888
	Service Population within TPAs	1,526,433	3,542,583	2,016,150

Bicycle	Lane Miles of Bike Facilities	3,420	7,114	3,694
	Class I	354	1,077	723
	Class II	2,284	3,142	858
	Class III	722	824	102
	Class IV	45	1,785	1,740
	Bike Boulevard	15	286	271
	Average Daily Bicycle Trips	208,520	243,061	34,541

Mode	Category	Baseline Year 2022	Year 2050 Proposed Plan	Change from Baseline Year 2022
	Bicycle Mode Share	1.4%	1.6%	0.2%
	Average Length of Bicycle Trip (miles)	3.7	4.5	0.8
Pedestrian	Average Daily Pedestrian Trips	2,265,441	2,655,865	390,424
	Pedestrian Mode Share	15.3%	17.4%	2.1%
	Average Length of Pedestrian Trip (miles)	0.9	0.9	0.0

[1] VMT per employee accounts for trips from the work commute tours and at-work subtours only

[2] Service population includes non-institutionalized population and employment within the area

Source: ABM3, March 2025

As discussed below, the metrics outlined in Table 4.16-6 show that the proposed Plan is consistent with the circulation system policies outlined in the Amended 2021 Regional Plan and Riding to 2050, and therefore, do not conflict with them:

Amended 2021 Regional Plan

- *Land Use and Regional Growth*. Implementation of the proposed Plan would increase transit ridership, as well as the number of walking and biking trips within the proposed Plan region. This projection suggests the proposed Plan would provide convenient access to multi-modal travel options, as prescribed by the policy. Additionally, the proposed Plan would increase the total service population within TPAs; thus, increasing the proximity of jobs and residents to transit opportunities, as prescribed by the policy. Therefore, the proposed Plan is consistent with portions of this policy that relate to the circulation system.
- *Parking and Curb Management*. The proposed Plan includes system wide investments towards parking and curb management strategies that are similar to those included in the Amended 2021 Regional Plan. Additionally, parking management strategies similar to those in the Amended 2021 Regional Plan have been included in the proposed Plan's Transportation Demand Management Policy. Therefore, the proposed Plan is consistent with this policy.
- *Transportation Demand Management*. The proposed Plan includes similar policy language and Transportation Demand Management strategies and programs to the Amended 2021 Regional Plan. Additionally, as shown in Table 4.16-6, implementation of the proposed Plan would reduce the vehicular mode share within the region by 3.2 percentage points, maintaining one of the intents of this policy by reducing the number of single-occupant vehicle trips within the region. Therefore, the proposed Plan is consistent with this policy.
- *Vision Zero*. The proposed Plan includes similar policy language and Vision Zero based transportation network improvements, strategies, and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Fix It First*. The proposed Plan includes similar policy language and Fix It First strategies and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Transportation System Management and Operations*. The proposed Plan includes similar policy language and Transportation System Management and Operations strategies and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Value Pricing*. The proposed Plan will maintain the managed lanes, fees charged to Transportation Network Companies, and transit subsidy programs included within the policy. Therefore, the proposed Plan is consistent with this policy.

The proposed Plan is also consistent with the following goals from Riding to 2050:

- *Increase the number of people who bike and frequency of bicycle trips for all purposes*. As shown in Table 4.16-6, implementation of the proposed Plan would increase bicycle ridership within the region by 34,541 daily trips, under Year 2050 conditions.

- *Improve safety for bicyclists*. As shown in Table 4.16-6, the proposed Plan would increase the total number of protected and separated bicycle facilities within the region (Class I, Class II, and Class IV facilities). These facilities provide cyclists their own right-of-way within the roadway and reduce the number of conflicts with vehicular traffic, resulting in safer conditions.

2050 Conclusion

Under Year 2050 conditions the proposed Plan would implement over 3,694 additional lane miles of bicycle facilities, and over 226,000 additional miles of transit service within the region. The proposed Plan would also increase the number of bicycle, pedestrian, and transit trips generated within the region, while reducing the vehicular mode share from 79.2 percent to 73.6 percent, compared to Baseline Year 2022 conditions. These characteristics of the proposed Plan are generally consistent with the policies outlined in the Amended 2021 Regional Plan and Riding to 2050 and would not conflict with them. Additionally, the policy language and goals in the proposed Plan and the Amended 2021 Regional Plan are similar. Therefore, implementation of the proposed Plan, under Year 2050 conditions, would result in a less-than-significant impact.

2036-2050

Transportation Network Improvements and Programs

Table 4.16-7 outlines the anticipated change in transportation network and projected travel demand, by mode, between Base Year 2036 conditions and proposed Plan Year 2050 conditions, to identify how the implementation of the plan would affect the transportation network and travel demand throughout the San Diego Region.

Table 4.16-7 Transportation System Analysis – Years 2036 to 2050

Mode	Category	Baseline Year 2036[1]	Year 2050 Proposed Plan	Change from Baseline Year 2036
Transit	Miles of Transit Service	328,229	334,227	5,998
	Commuter Rail	4,393	4,030	-363
	Light Rail Transit	24,507	34,401	9,894
	Rapid	144,186	142,154	-2,032
	Bus	155,143	153,643	-1,500
	Population within TPAs	1,885,975	1,919,031	33,056
	Employment within TPAs	1,531,064	1,623,552	92,488
	Service Population within TPAs	3,417,039	3,542,583	125,544
	Average Daily Transit Trips	481,660	516,794	35,134
	Transit Mode Share	3.2%	3.4	3.4
	Average Length of Transit Trip (miles)	9.3	9.3	0.0
Auto	Miles of Roadways	7,418	7,514	96
	Freeway (includes auxiliary lanes)	2,752	2,777	25
	General Purpose Lanes	2,465	2,322	-143

	Average Length of Pedestrian Trip (miles)	0.9	0.9	0.0

[1] The changes between Base Year 2036 and proposed Plan Year 2035 conditions are assumed to be negligible; thus, Base Year 2036 conditions were derived from Table 4.16-5.

[2] VMT per employee accounts for trips from the work commute tours and at-work subtours only

[3] Service population includes non-institutionalized population and employment within the area

Source: ABM3, March 2025

As discussed below, the metrics outlined in Table 4.16-7 show that the proposed Plan is consistent with the circulation system policies outlined in the Amended 2021 Regional Plan and Riding to 2050, and therefore, do not conflict with them:

Amended 2021 Regional Plan

- *Land Use and Regional Growth*. Implementation of the proposed Plan would increase transit ridership, as well as the number of walking and biking trips within the proposed Plan region. This projection suggests the proposed Plan would provide convenient access to multi-modal travel options, as prescribed by the policy. Additionally, the proposed Plan would increase the total service population within TPAs; thus, increasing the proximity of jobs and residents to transit opportunities, as prescribed by the policy. Therefore, the proposed Plan is consistent with portions of this policy that relate to the circulation system.
- *Parking and Curb Management*. The proposed Plan includes system wide investments towards parking and curb management strategies that are similar to those included in the Amended 2021 Regional Plan. Additionally, parking management strategies similar to those in the Amended 2021 Regional Plan have been included in the proposed Plan's Transportation Demand Management Policy. Therefore, the proposed Plan is consistent with this policy.
- *Transportation Demand Management*. The proposed Plan includes similar policy language and Transportation Demand Management strategies and programs to the Amended 2021 Regional Plan. Additionally, as shown in Table 4.16-7, implementation of the proposed Plan would reduce the vehicular mode share within the region by 2.4 percentage points, maintaining one of the intents of this policy by reducing the number of single-occupant vehicle trips within the region. Therefore, the proposed Plan is consistent with this policy.

- *Vision Zero*. The proposed Plan includes similar policy language and Vision Zero based transportation network improvements, strategies, and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Fix It First*. The proposed Plan includes similar policy language and Fix It First strategies and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Transportation System Management and Operations*. The proposed Plan includes similar policy language and Transportation System Management and Operations strategies and programs to the Amended 2021 Regional Plan. Therefore, the proposed Plan is consistent with this policy.
- *Value Pricing*. The proposed Plan will maintain the managed lanes, fees charged to Transportation Network Companies, and transit subsidy programs included within the policy. Therefore, the proposed Plan is consistent with this policy.

The proposed Plan is also consistent with the following goals from Riding to 2050:

- *Increase the number of people who bike and frequency of bicycle trips for all purposes*. As shown in Table 4.16-7, implementation of the proposed Plan would increase bicycle ridership within the region by 33,165 daily trips, over this time period.
- *Improve safety for bicyclists*. As shown in Table 4.16-7, the proposed Plan would increase the total number of protected and separated bicycle facilities within the region (Class I, Class II, and Class IV facilities). These facilities provide cyclists their own right-of-way within the roadway and reduce the number of conflicts with vehicular traffic, resulting in safer conditions.

2036-2050 Conclusion

Over this time period the proposed Plan would implement over 3,694 additional miles of bicycle facilities, and over 5,998 additional miles of transit service within the region. The proposed Plan would also increase the number of bicycle, pedestrian, and transit trips generated within the region, while reducing the vehicular mode share from 76.0 percent to 73.6 percent, compared to Baseline Year 2036 conditions. These characteristics of the proposed Plan are generally consistent with the policies outlined in the Amended 2021 Regional Plan and Riding to 2050 and would not conflict with them. Additionally, the policy language and goals in the proposed Plan and the Amended 2021 Regional Plan are similar. Therefore, implementation of the proposed Plan between Base Year 2036 and Year 2050 conditions, would result in a less-than-significant impact.

MITIGATION MEASURES

No mitigation measures are required for this impact.

TRA-2 CONFLICT OR BE INCONSISTENT WITH CEQA GUIDELINES SECTION 15064.3 BY NOT ACHIEVING THE SUBSTANTIAL VMT REDUCTIONS NEEDED TO HELP ACHIEVE STATEWIDE GHG REDUCTION GOALS.

Analysis Methodology

Section 15064.3(B) of the CEQA Guidelines criteria for analyzing and determining transportation impacts, states:

> (b) Criteria for Analyzing Transportation Impacts.
>
> (1) Land Use Projects. Vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact. Projects that decrease vehicle miles traveled in the project area compared to existing conditions should be considered to have a less than significant transportation impact.
>
> (2) Transportation Projects. Transportation projects that reduce, or have no impact on, vehicle miles traveled should be presumed to cause a less than significant transportation impact. For roadway

> capacity projects, agencies have discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable requirements. To the extent that such impacts have already been adequately addressed at a programmatic level, a lead agency may tier from that analysis as provided in Section 15152.
>
> (3) Qualitative Analysis. If existing models or methods are not available to estimate the vehicle miles traveled for the particular project being considered, a lead agency may analyze the project's vehicle miles traveled qualitatively. Such a qualitative analysis would evaluate factors such as the availability of transit, proximity to other destinations, etc. For many projects, a qualitative analysis of construction traffic may be appropriate.
>
> (4) Methodology. A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled and may revise those estimates to reflect professional judgment based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project. The standard of adequacy in Section 15151 shall apply to the analysis described in this section.

As noted above, VMT is an appropriate measure to identify transportation-related impacts under CEQA. The specific guidelines provided by CEQA Guidelines Section 15064.3(b)(1) and (2) are intended to be applied at the project level; as such, they are not directly applicable to the program-level transportation network improvements and the regional growth from land use changes that are included in the proposed Plan. However, Section 15064.3(b)(4) does allow for lead agencies to determine the methodology for evaluating VMT, and CEQA Guidelines Section 15064(b) provides lead agencies with discretion to establish a threshold of significance.

In response to the implementation of SB 743 and CEQA Guidelines Section 15064.3(b), the State developed additional guidance on how VMT-related impacts can be evaluated, as well as how to establish impact thresholds using the new VMT metric. Key guidance on transportation impacts and VMT is provided by the OPR VMT Technical Advisory (OPR 2018), and the CARB Scoping Plan for Achieving Carbon Neutrality, adopted on November 16, 2022 (CARB 2022). However, neither document provides guidance or thresholds in regard to assessing the significance of VMT impacts for RTPs at the regional level. The recommendations of both documents are discussed below:

OPR Technical Advisory on Evaluating Transportation Impacts in CEQA: The OPR Technical Advisory provides guidance on determining significance thresholds and assessing VMT. The guidance provided within the Technical Advisory is directed to specific projects by project type (i.e., residential, retail, office, etc.) and local plans (i.e. general plans) and includes recommendations for evaluating transportation impacts. The Technical Advisory utilizes the findings of the 2017 Climate Change Scoping Plan as substantial evidence to establish a VMT threshold for certain land use development projects, stating that:

> In summary, achieving 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals.

The OPR Technical Advisory does somewhat address VMT-related impacts associated with the development and implementation of General Plans, noting:

> A general plan, area plan, or community plan may have a significant impact on transportation if proposed new residential, office, or retail land uses would in aggregate exceed the respective thresholds recommended above.

However, the Technical Advisory does not provide guidance on the VMT-related impacts that may be associated with regional plans, such as an RTP and SCS, as included in the proposed Plan.

2022 Scoping Plan for Achieving Carbon Neutrality: In November 2022, CARB published an update of the CARB 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals (CARB 2022). The 2022 Scoping Plan establishes strategies for achieving the AB 1279 goals of achieving 85 percent reduction of anthropogenic GHG

emissions, and carbon neutrality by 2045. The 2022 Scoping Plan concludes that the State is not on track to meet the CARB 2017 VMT reduction goals, thus the 2022 Scoping Plan recommends that the State reduce VMT per capita generation by 30 percent, from the Year 2019 conditions, by Year 2045 to achieve its climate goals. The 2022 Scoping Plan also sets an interim VMT per capita reduction target of 25 percent by Year 2030 conditions.

The 2022 Scoping Plan notes that it does not set regulatory limits on VMT and that the authority to reduce VMT largely lies with state, regional, and local transportation, land use, and housing agencies, along with the legislature and its budgeting choices.

VMT Analysis Approach

This EIR's VMT analysis was largely quantitative, consistent with CEQA Guidelines Section 15064.3. The ABM3 was utilized to derive the VMT metrics analyzed under each analysis scenario. The ABM3 is a travel demand forecasting model that incorporates census data and travel surveys to inform the algorithms of the model's projections. It uses a simulated population based on existing and projected demographics, to match residents to employment, and forecasts the daily travel on the regional transportation network. In addition, the model tracks the daily travel of individuals in the simulated population, including origins, destinations, travel distances, and mode choices. This allows the ABM3 to project transportation metrics such as trip generation, trip assignment, and VMT at both a regional and local level.

The ABM3 has three forecast scenarios: Baseline Year 2022, which provides a forecast of the year the model inputs (land uses, mobility network, and socio-economic data) are based on, Interim Year 2035, and Horizon Year 2050 conditions. The Year 2035 and 2050 scenarios are derived based on the planned land uses and mobility improvements within the region, as well as population and employment projections. The different components of the proposed Plan are projected to be implemented over 25 years with a buildout year projected in approximately 2050.

Because of the close relationship between forecasted regional growth, land use change, and planned transportation network improvements and programs on travel behavior, this section analyzes their combined effect on per capita VMT and total VMT, instead of providing separate analyses for regional growth and land use change and transportation network improvements and programs.

Significance Thresholds

VMT Per Capita: 2022 Scoping Plan notes "we also know we are not on track to achieve the VMT reduction called for in the 2017 Scoping Plan and will need to double down to achieve the even more ambitious target called for in the Scoping Plan Scenario." As a response to this, the 2022 Scoping Plan includes a target to reduce the statewide VMT per capita to 25 percent below 2019 levels by 2030, as well as the overall target to reduce the statewide VMT per capita to 30 percent below 2019 levels by 2045. While these targets are not regulatory requirements, they are intended to inform future planning processes. Therefore, the updated VMT per capita reduction goals included in 2022 Scoping Plan are used as a guide to determine whether the proposed Plan would reach the substantial VMT reductions needed to help achieve statewide GHG reduction goals.

CARB stresses that the VMT developed in its estimates "is not household-generated VMT, and the values are not directly comparable to the output from a local or regional travel demand model." ABM3 derives VMT estimates based on household-generated VMT; as such, the results of the model may not directly align with the results of the 2022 Scoping Plan. However, ABM3 is currently the best tool within the San Diego region for estimating baseline and future year VMT metrics, including total VMT and VMT per capita; therefore, the ABM3 was used in the analysis of the 2022 Scoping Plan VMT reduction goals.

ABM3 does not include scenarios for year 2019, 2030, and 2045 conditions, which are the timeframes in which the 2022 Scoping Plan VMT reductions goals are set. Therefore, to project the VMT analysis metrics under these scenarios, the results from ABM3 Year 2035 and 2050 scenarios were interpolated to derive the VMT metrics for the 2022 Scoping Plan target years (years 2030 and 2045).

Total VMT. Because there are no State-recommended total VMT significance thresholds for regional plans such as the proposed Plan, a qualitative threshold was used: would the proposed Plan achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals? If the proposed Plan would cause substantial

increases in total VMT, then it would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals and would, therefore, result in a significant impact on VMT.

Interim VMT per Capita Targets (for Informational Purposes). As noted above, the State's VMT per capita reduction goal is 25 percent below Year 2019 conditions by Year 2030 and 30 percent by Year 2045. The State did not establish any additional interim year targets. However, for informational purposes, and to further evaluate if the proposed Plan would be on track to meet the State's VMT reduction goals, an interim year VMT reduction goal was estimated for Year 2035 conditions. The interim year target was derived based on a straight-line interpretation of the full 25 percent and 30 percent reductions in VMT per capita that the region has to achieve by Year 2030 and Year 2045, respectively:

Year 2035

Year 2045 – Year 2030 = 15 years.

- 30 percent Year 2045 reduction goal – 25 percent Year 2030 reduction goal = 5 percent reduction over the 15 years
- 5 percent / 15 years = 0.3 percent reduction per year between Year 2030 and Year 2045
- 0.3 percent reduction per year X 5 years (Year 2035 – Year 2030) = 1.7 percent
- 1.7 percent + 25 percent (Year 2030 target) = 26.7 percent

In addition, it was assumed that for 2050, the ultimate 30 percent reduction goal for 2045 would be maintained.

The thresholds described above are unique to the proposed Plan, due to its regional and comprehensive nature. These thresholds are not intended for application to other project types, in particular to individual land use projects for which State-recommended per capita VMT thresholds may be appropriate.

Impact Analysis

As noted under the significance thresholds, CARB 2022 utilizes Year 2019 conditions as the year in which the VMT reduction goals are measured against. Therefore, TRA-2 utilizes a starting year of 2019 instead of the analysis Base Year of 2022.

2030

Regional Growth and Land Use Change and Transportation Network Improvements and Programs

Table 4.16-8 summarizes the VMT projections and analyses developed under Year 2030 conditions. Total VMT and VMT per capita results are presented and compared between Starting Year - Year 2019 and proposed Plan Year 2030 conditions to identify VMT-related impacts.

Table 4.16-8 VMT Analysis – Year 2030

Metric	Starting Year - Year 2019[1]	Year 2030 Proposed Plan	Difference between Starting Year - Year 2019 and Year 2030 Proposed Plan	% Change between Starting Year - Year 2019 and Year 2030 Proposed Plan
Total VMT (daily)[2]	77,181,443	79,810,491	2,629,048	3.4%
VMT per Capita (miles)[2]	16.9	16.2	-0.7	-4.1%

[1]The ABM 3 does not include a year 2019 scenario; therefore, the year 2019 VMT metrics were derived via linear interpolation using year 2022 and year 2035 data.

[2] The VMT calculations do not include the off-model VMT reduction in Appendix M to the proposed Plan because the reduction was not calculated for 2030 conditions. Therefore, the VMT figures may be slightly overstated in this analysis. However, the reduction is minor (less than 0.23 percent) and not anticipated to reduce the impacts to less than significant. See Appendix M of the proposed Plan for additional details.

Source: ABM3, March 2025.

As shown in Table 4.16-8, implementation of the proposed Plan, under Year 2030 conditions, would result in a 4.1 percent decrease in the region's VMT per capita, as compared to Starting Year - Year 2019 conditions. This is less than the 25 percent reduction needed to meet the State's Year 2030 VMT per capita reduction goal.

Implementation of the proposed Plan, under Year 2030 conditions, would also result in an increase in the total daily VMT generated by the region of 2,629,048 (3.4 percent) compared to Starting Year - Year 2019 conditions. The increase is considered substantial because it increases the overall VMT production within the San Diego Region and does not help to achieve the statewide GHG reduction targets, as discussed in the previous paragraph; therefore it is significant.

2030 Conclusion

As shown in Table 4.16-7, implementation of the proposed Plan, under Year 2030 conditions, would result in a decrease in VMT per capita of 4.1 percent below Starting Year - Year 2019 conditions. This is less than the 25 percent reduction needed to achieve the State's Year 2030 interim VMT per capita reduction goal and is therefore inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals, and a significant impact. Implementation of the proposed Plan would also result in an increase of 2,629,048 (3.4 percent) daily VMT generated within the San Diego region compared to Starting Year - Year 2019 conditions, which is considered a substantial increase. Therefore, this impact (TRA-2) is considered significant in the year 2030 because the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals.

2035

Regional Growth and Land Use Change and Transportation Network Improvements and Programs

Table 4.16-9 summarizes the VMT projections and analyses developed under Year 2035 conditions. Total VMT and VMT per capita results are presented and compared between Starting Year - Year 2019 and proposed Plan Year 2035 conditions to identify VMT-related impacts.

Table 4.16-9 VMT Analysis – Year 2035

Metric	Starting Year - Year 2019[1]	Year 2035 Proposed Plan	Difference between Starting Year - Year 2019 and Year 2035 Proposed Plan	% Change between Starting Year - Year 2019 and Year 2035 Proposed Plan
Total VMT (daily)[2]	77,181,443	81,005,512	3,824,069	5.0%
VMT per Capita (miles)[2]	16.9	15.9	-1.0	-5.9%

[1]The ABM 3 does not include a year 2019 scenario; therefore, the year 2019 VMT metrics were derived via linear interpolation using year 2022 and year 2035 data.

[2] The VMT calculations do not include the off-model VMT reduction in Appendix M to the proposed Plan because the reduction was not calculated for 2030 conditions. Therefore, the VMT figures may be slightly overstated in this analysis. However, the reduction is minor (0.23 percent) and is not anticipated to reduce the impacts to less than significant. See Appendix M of the proposed Plan for additional details.

Source: ABM3, March 2025.

As shown in Table 4.16-9, implementation of the proposed Plan, under Year 2035 conditions, would result in a 5.9 percent decrease in the region's VMT per capita, as compared to Starting Year - Year 2019 conditions. This is less than the 26.7 percent reduction needed to meet the State's Year 2035 VMT per capita interim reduction goal.

Implementation of the proposed Plan, under Year 2035 conditions, would also result in an increase to the total daily VMT generated by the region of 3,824,069 (5.0 percent) compared to Starting Year - Year 2019 conditions. The increase is substantial because it increases the overall VMT production within the San Diego Region and does not help to achieve the statewide GHG reduction targets, as discussed in the previous paragraph; therefore, it is significant.

2035 Conclusion

As shown in Table 4.16-9, implementation of the proposed Plan, under Year 2035 conditions, would result in a decrease in VMT per capita of 5.9 percent below Starting Year - Year 2019 conditions. This is less than the 26.7 percent reduction needed to achieve the State's Year 2035 interim VMT per capita reduction goal, and is therefore inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals, and a significant impact. Implementation of the proposed Plan would also result in an increase of 3,824,069 (5.0 percent) daily VMT generated within the San Diego region compared to Starting Year - Year 2019 conditions, which is considered a substantial increase. Therefore, this impact (TRA-2) is considered significant in the year 2035 because the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals.

2045

Regional Growth and Land Use Change and Transportation Network Improvements and Programs

Table 4.16-10 summarizes the VMT projections and analyses developed under Year 2045 conditions. Total VMT and VMT per capita results are presented and compared between Starting Year - Year 2019 and proposed Plan Year 2045 conditions to identify VMT-related impacts.

Table 4.16-10 VMT Analysis – Year 2045

Metric	Starting Year - Year 2019[1]	Year 2045 Proposed Plan	Difference between Starting Year - Year 2019 and Year 2045 Proposed Plan	% Change between Starting Year - Year 2019 and Year 2045 Proposed Plan
Total VMT (daily)[2]	77,181,443	81,351,592	4,170,149	5.4%
VMT per Capita (miles)[2]	16.9	15.6	-1.3	-7.7%

[1]The ABM 3 does not include a year 2019 scenario; therefore, the year 2019 VMT metrics were derived via linear interpolation using year 2022 and year 2045 data.

[2] The VMT calculations do not include the off-model VMT reduction in Appendix M to the proposed Plan because the reduction was not calculated for 2030 conditions. Therefore, the VMT figures may be slightly overstated in this analysis. However, the reduction is minor (0.15 percent) and is not anticipated to reduce the impacts to less than significant. See Appendix M of the proposed Plan for additional details.

Source: ABM3, March 2025.

As shown in Table 4.16-10, implementation of the proposed Plan, under Year 2045 conditions, would result in a 7.7 percent decrease in the region's VMT per capita, as compared to Starting Year - Year 2019 conditions. This is less than the 30 percent reduction needed to meet the State's Year 2045 VMT per capita reduction goal.

Implementation of the proposed Plan, under Year 2045 conditions, would also result in an increase to the total daily VMT generated by the region of 4,170,149 (5.4 percent) compared to Starting Year - Year 2019 conditions. The increase is substantial because it increases the overall VMT production within the San Diego Region and does not help to achieve the statewide GHG reduction targets, as discussed in the previous paragraph; therefore, it is significant.

2045 Conclusion

As shown in Table 4.16-10, implementation of the proposed Plan, under Year 2045 conditions, would result in a decrease in VMT per capita of 7.7 percent below Starting Year - Year 2019 conditions. This is less than the 30 percent reduction needed to achieve the State's Year 2045 VMT per capita reduction goal and is therefore inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals, and a significant impact. Implementation of the proposed Plan would also result in an increase of 4,170,149 daily VMT (5.4 percent) generated within the San Diego region compared to Starting Year - Year 2019 conditions, which is considered a substantial increase. Therefore, this impact (TRA-2) is considered significant in the year 2045 because the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals.

2050
Regional Growth and Land Use Change and Transportation Network Improvements and Programs

Table 4.16-11 summarizes the VMT projections and analyses developed under Year 2050 conditions. Total VMT and VMT per capita results are presented and compared between Starting Year - Year 2019 and proposed Plan Year 2050 conditions to identify VMT-related impacts.

Table 4.16-11 VMT Analysis – Year 2050

Metric	Starting Year - Year 2019[1]	Year 2050 Proposed Plan	Difference between Starting Year - Year 2019 and Year 2050 Proposed Plan	% Change between Starting Year - Year 2019 and Year 2050 Proposed Plan
Total VMT (daily)[2]	77,181,443	81,524,632	4,343,189	5.6%
VMT per Capita (miles)[2]	16.9	15.4	-1.5	-8.9%

[1]The ABM 3 does not include a year 2019 scenario; therefore, the year 2019 VMT metrics were derived via linear interpolation using year 2022 and year 2050 data.

[2] The VMT calculations do not include the off-model VMT reduction in Appendix M to the proposed Plan because the reduction was not calculated for 2030 conditions. Therefore, the VMT figures may be slightly overstated in this analysis. However, the reduction is minor (0.15 percent) and is not anticipated to reduce the impacts to less than significant. See Appendix M of the proposed Plan for additional details.

Source: ABM3, March 2025.

As shown in Table 4.16-11, implementation of the proposed Plan, under Year 2050 conditions, would result in an 8.9 percent decrease in the region's VMT per capita, as compared to Starting Year - Year 2019 conditions. This is less than the 30 percent reduction needed to meet the State's Year 2050 VMT per capita reduction goal.

Implementation of the proposed Plan, under Year 2050 conditions, would also result in an increase to the total daily VMT generated by the region of 4,343,189 (5.6 percent) compared to Starting Year - Year 2019 conditions. The increase is substantial because it increases the overall VMT production within the San Diego Region and does not help to achieve the statewide GHG reduction targets, as discussed in the previous paragraph; therefore it is significant.

2050 Conclusion
As shown in Table 4.16-11, implementation of the proposed Plan, under Year 2050 conditions, would result in a decrease in VMT per capita of 8.9 percent below Starting Year - Year 2019 conditions. This is less than the 30 percent reduction needed to achieve the State's Year 2045 VMT per capita reduction goal and is therefore inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals, and a significant impact. Implementation of the proposed Plan would also result in an increase of 4,343,189 daily VMT (5.6 percent) generated within the San Diego region compared to Starting Year - Year 2019 conditions, which is considered a substantial increase. Therefore, this impact (TRA-2) is considered significant in the year 2050 because the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals.

MITIGATION MEASURES

TRA-2 CONFLICT OR BE INCONSISTENT WITH CEQA GUIDELINES SECTION 15064.3 BY NOT ACHIEVING THE SUBSTANTIAL VMT REDUCTIONS NEEDED TO HELP ACHIEVE STATEWIDE GHG REDUCTION GOALS.

Achieving further reductions in the total and per capita VMT generated within the region depends upon additional State policy actions and funding, as well as local jurisdictions' review and entitlement of individual land use development projects and Regional Arterial System (RAS) transportation projects, which could create inconsistencies with what is projected in the proposed Plan. In addition, transportation sponsors other than SANDAG, such as Caltrans, must evaluate and potentially mitigate any induced VMT that may be associated with the implementation of enhancements to the freeway and State highway system.

Therefore, mitigation measure TRA-2 focuses on project-specific mitigation measures that can and should be implemented to further reduce the region's total VMT and VMT per capita.

2030, 2035, 2045, and 2050

TRA-2: Achieve Further VMT Reductions for Transportation and Development Projects. During the project design and project-level CEQA review phases of transportation network improvements or land use development projects, SANDAG shall, and other transportation project sponsors (the Local jurisdictions) can, and should implement project-level VMT reduction measures in addition to those included in the Regional Plan. VMT reducing measures consist of, but are not limited to, the following:

- **Require TDM Strategies:** SANDAG and other transportation project sponsors (the Local jurisdictions) can, and should require all transportation network improvements or land use development projects, that are identified to have a significant VMT-related impact, to implement feasible TDM strategies to help offset their impacts. This mitigation measure will further reduce the proposed Plan's VMT because the potential VMT reductions associated with two TDM programs, which include vanpool and carshare were not incorporated into ABM3. Strategies, such as free shuttles, parking facilities for carshare, and site design features to facilitate walking, biking, and transit can, and should be used by land development projects to reduce VMT-related impacts. Additional project-level TDM measures not included in the proposed Plan should also be used, including walking, school bus programs, school pool programs, subsidized transit passes, unbundled parking, preferential parking programs for carpools/vanpools, and bike sharing programs.
- **Reduce Parking Minimums:** Local jurisdictions can, and should evaluate the feasibility of reducing their currently required parking minimums. Reducing the parking minimums for different land use types, where appropriate, can decrease project-level VMT by up to 13.7 percent (CAPCOA 2024).
- **Implement Additional Active Transportation Facilities Not Included in the Proposed Plan:** To further reduce local VMT-related impacts and take advantage of the regional bike network, SANDAG and other transportation project sponsors (the Local jurisdictions) can, and should implement additional active transportation facilities that provide connections from the regional bicycle network to local neighborhoods. The proposed Plan includes funding for Complete Streets investments in Mobility Hub areas, including implementation of bicycle and pedestrian facilities that provide local connections throughout Mobility Hub areas; however, the associated VMT reductions from this funding have not yet been determined; thus, they were not yet included in the EIR's VMT analysis. Therefore, this mitigation measure would achieve further VMT reductions through the funding of additional, locally based multi-modal facilities that were not assumed in the proposed Plan analysis. The implementation of locally based multi-modal facilities, funded through the proposed Plan, can reduce VMT on the roadway network adjacent to the multi-modal facility by 0.8 percent for bicycle facilities, and up to 6.4 percent for pedestrian facilities (CAPCOA 2024).
- **VMT Credit/Banking Program for Local VMT Reducing Infrastructure and Programs:** SANDAG can and should participate and help facilitate a VMT Credit/Banking Program where local jurisdictions can submit and bank VMT reduction credit for VMT reducing infrastructure and/or programs which the jurisdiction has implemented. Local jurisdictions would be able to sell their banked VMT reduction credits to development projects within the region or use the credits to offset their own VMT-related impacts associated with roadway capacity improvements. Revenues received from the program must be used to advance the timing or implementation of new VMT reducing infrastructure. This program may be used to fund and/or prioritize the development of local VMT reducing infrastructure and programs that are not included within the proposed Plan, thereby reducing VMT productions within the San Diego region beyond than what is projected in Tables 4.16-7 through 4.16-10. This program is currently being developed as part of a Caltrans Partnership Grant that was awarded to SANDAG and the County of San Diego.
- **VMT Exchange Program for Local VMT Reducing Infrastructure:** SANDAG can and should participate and help facilitate a regional VMT exchange program that allows local jurisdictions to advertise unfunded VMT reducing in which land use development projects can implement to offset their VMT-related impacts. This will allow land use development projects located in more rural and suburban jurisdictions with limited VMT

mitigation options to offset their VMT-related impacts by constructing infrastructure in other local jurisdictions with more VMT reducing opportunities. This program may fund construction of local VMT reducing infrastructure not included in the proposed Plan that not have been funded otherwise. The measure could thereby reduce VMT production within the San Diego region beyond the reductions projected in Tables 4.16-7 through 4.16-10. Similar to the VMT Credit/Banking Program, this program is currently being developed as part of a Caltrans Partnership Grant that was awarded to SANDAG and the County of San Diego.

The following mitigation measures presented in Section 4.8, "Greenhouse Gas Emissions," will further reduce both the total VMT and VMT per capita:

- GHG-4a *Allocate Grant Funding to Projects that Reduce GHG Emissions*.
- GHG-4b *Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans*.
- GHG-4d *Implement Measures to Reduce GHG Emissions from Transportation Projects*.
- GHG-4e *Implement Measures to Reduce GHG Emissions from Development Projects*.

The following mitigation measures presented in Section 4.3 "Air Quality" will further reduce both the total VMT and VMT per capita:

- AQ-2b. *Regional Plan VMT Credit/Banking Program*.

SIGNIFICANCE AFTER MITIGATION

2030, 2035, 2045, 2050

By Plan Year 2050, the proposed Plan would reduce the region's VMT per capita by 8.9 percent over Starting Year 2019 conditions. As outlined in Tables M-17 through M-19 in Appendix M of the proposed Plan, there are some TDM strategies (Vanpool and Carsharing programs) included in the proposed Plan that are too minor to be incorporated into ABM3 and were therefore excluded from the transportation impact analysis assumptions. As noted within Appendix M of the proposed Plan, these reductions could further reduce the total VMT generated within the region by an additional 0.15 percent by Year 2050. These reductions were calculated based on their influence of the total VMT generated within the region. As such, these strategies would likely have further reduce the region's VMT per capita, since the majority of trips within the region are home-based (i.e. trips starting and/or ending at the residents dwelling unit). Therefore, by 2050, the region could achieve reductions of up to of 9.05 percent (8.9 percent + 0.15 percent) in VMT per capita, over Starting Year 2019 conditions, if these strategies are fully implemented. This would exceed the CARB target reduction of 30 percent by 2045.

As noted in the mitigation section, TDM strategies generally are required and implemented at the project level by local agencies. The VMT reductions associated with these project-level TDM measures can vary greatly based on the project type, location, and size; therefore, an overall regionwide reduction cannot be estimated at the program level. It is also assumed that any VMT reductions associated with the VMT Credit/Banking Program would go towards offsetting the VMT-related impacts associated with the roadway infrastructure improvements included within the proposed Plan. While some additional VMT reduction credits may be available to offset the VMT-related impacts associated with land use development projects, the scope and the magnitude of the available credits is unknown at this time.

As outlined in Tables 4.5-7 through 4.5-10, the regional VMT per capita is more than 20.95 percent higher than the threshold to meet, or keep pace with, the State's GHG reduction goals under each horizon year (20.95 percent = 30 percent threshold – VMT per Capita 9.05 percent below the 2019 rates). Therefore, the full implementation of the proposed mitigation, under any horizon year, would not reduce impacts to a less than significant level for any horizon year (i.e., 2030, 2035, 2045, or 2050). Additionally, the identified VMT reductions associated with the mitigation measures would not significantly reduce the daily VMT generated within the San Diego region to a

level that would no longer be considered substantial. Therefore, this impact would be significant and unavoidable under the proposed Plan.

SANDAG cannot require local agencies implementing development projects, or other transportation project sponsors, to adopt the above mitigation measures. It is ultimately the responsibility of the CEQA lead agency to determine and adopt mitigation. Therefore, this impact would be significant and unavoidable.

TRA-3 SUBSTANTIALLY INCREASE HAZARDS DUE TO A DESIGN FEATURE (E.G., SHARP CURVES OR DANGEROUS INTERSECTIONS) OR INCOMPATIBLE USES.

Analysis Methodology

The focus of this analysis is to determine if implementation of the proposed Plan would lead to new or increased safety hazards within the region's transportation network. The proposed Plan contains various projects that would modify or expand the regional transportation network. These projects were developed to address existing deficiencies and/or future needs given projected population, employment, and travel growth in the region. If implementation of these projects were determined to increase hazards within the region's transportation network (e.g., increase the likelihood of collisions or other dangers) there would be a significant impact. The impact analysis focuses on consistency with design standards related to traffic safety in order to determine whether impacts are significant. The impact analysis considers the proposed Plan's transportation network improvements and programs, but not the proposed Plan's regional growth and land use change, because the Impact TRA-3 significance criterion is limited to transportation project safety hazard issues.

Impact Analysis

2035

Transportation Network Improvements and Programs

The proposed Plan would expand regional transportation safety programs and efforts. Highlighted below are several planning efforts included in the proposed Plan that would improve transportation safety within the region:

- *Development of Regional Vision Zero Program:* The proposed Plan introduces the Vision Zero Program with the aim of keeping all roadway users—especially vulnerable users—safe through the use of data, project prioritization, education, and community engagement. See Appendix A of the 2025 Regional Plan for more information.
- *Proposed Plan Network Development*: Safety data (crash history) was applied to project bundles during the network-development process through an evaluation criteria. See Appendix N of the 2025 Regional Plan for more information.
- *Federal Transportation Performance Management*: Planning and programming are informed by five safety performance targets for all public roads and seven transit safety performance targets that the lead CEQA agency monitors and updates on a regular schedule. See Appendix P of the 2025 Regional Plan for more information.
- *Strategic Highway Safety Plan*: The proposed Plan is consistent with the 2020 Strategic Highway Safety Plan (SHSP). SANDAG supported the development of this statewide plan and continues support of plan implementation through SHSP Challenge Area Teams.
- *Comprehensive Multimodal Corridor Plans (CMCPs)*: These subregional plans develop groupings of transportation projects that are evaluated using performance measures, including safety improvements (SANDAG 2025b).

The transportation network improvements and programs in the proposed Plan would be required to conform to the design standards of the public agency responsible for implementation. Design standard conformance is a key part of developing networks that provide common expectations for users to minimize hazardous conflicts and conditions that could contribute to collisions. The standards outlined in the California MUTCD, HDM, and MTS'

Design for Transit (see Section 4.16.2), as well as the street design manuals adopted by the local jurisdictions, cover all aspects of the transportation right-of-way, including physical and operational features, as well as appropriate actions during construction. Utilizing infrastructure designs based on established, tested, and peer reviewed standards, as provided within these documents, will help to ensure higher levels of safety both in the construction and operation of the transportation improvements included within the proposed Plan.

The transportation network improvements and programs included under Year 2035 conditions in the proposed Plan would not change the applicable safety design standards of the implementing agencies. The transportation network improvements would be designed consistent with those standards. Further, the proposed Plan includes several planning efforts that would improve transportation safety within the region. Therefore, this impact is less than significant.

2035 Conclusion

Implementation of the proposed Plan by 2035 would not change the applicable design standards of the implementing agencies, and the transportation network improvements would be designed consistent with those standards. Further, the proposed Plan includes several planning efforts that would improve transportation safety. Therefore, impacts would be less than significant.

2050

Transportation Network Improvements and Programs

The proposed Plan would expand regional transportation safety programs and efforts. As highlighted in the 2035 impact analysis, there are several planning efforts included in the proposed Plan that would improve transportation safety within the region.

The transportation network improvements and programs in the proposed Plan would be required to conform to the design standards of the public agency responsible for implementation. Design standard conformance is a key part of developing networks that provides common expectations for users to minimize hazardous conflicts and conditions that could contribute to collisions. The standards outlined in the California MUTCD, HDM, and MTS' *Design for Transit* (see Section 4.16.2), as well as the street design manuals adopted by the local jurisdictions, cover all aspects of the transportation right-of-way, including physical and operational features, as well as appropriate actions during construction. Utilizing infrastructure designs based on established, tested, and peer reviewed standards, as provided within these documents, will help to ensure higher levels of safety both in the construction and operation of the transportation improvements included within the proposed Plan.

The transportation network improvements and programs included under Year 2050 conditions in the proposed Plan would not change the applicable safety design standards of the implementing agencies. The transportation network improvements would be designed consistent with those standards. Further, the proposed Plan includes several planning efforts that would improve transportation safety within the region. Therefore, this impact is less than significant.

2050 Conclusion

Implementation of the proposed Plan by 2050would not change the applicable design standards of the implementing agencies, and the transportation network improvements would be designed consistent with those standards. Further, the proposed Plan includes several planning efforts that would improve transportation safety. Therefore, impacts would be less than significant.

TRA-4 LEAD TO A LACK OF PARKING SUPPLY THAT WOULD CAUSE SIGNIFICANT SECONDARY ENVIRONMENTAL IMPACTS NOT ALREADY ANALYZED IN OTHER RESOURCE CHAPTERS OF THIS EIR.

Analysis Methodology

Per Public Resources Code Section 2099(d)(1), parking impacts are not considered an environmental impact under CEQA for residential, mixed-use residential, or employment center projects located on an infill site within a TPA.

The majority of the proposed policies in the Plan relating to parking operations and management would be applied within a TPA. Changes in parking operations, supply, and management can have an effect on the way people travel within the region and ultimately influence VMT. These changes may affect air quality, energy, and GHG impacts, as disclosed within Sections 4.3, 4.6, and 4.8 of this EIR, respectively. Therefore, if the implementation of the policies included in the proposed Plan would lead to lack of parking supply causing a significant impact to another resource category not already analyzed in this EIR, the proposed Plan's parking impact would be considered significant.

Parking supply requirements for private land uses are generally developed and regulated by local jurisdictions; thus, the proposed Plan would not directly affect the provision or amount of parking supply for future land use developments. Thus, the parking requirements and potential deficiencies associated with the land use growth is not affected by the proposed Plan. Therefore, a qualitative analysis was conducted to determine if the Pricing Strategies and the Parking Management Strategies, included in the Transportation Demand Management Policy (See Appendix A of the proposed Plan for more information), would reduce the public parking supply, throughout the region, to a level where a lack of public parking supply could cause a significant impact on other environmental resources.

Impact Analysis

2035

Transportation Network Improvements and Programs

Dynamic pricing for on-street parking spaces is included in the pricing strategies and policies included in the proposed Plan. The proposed Plan will promote dynamic pricing for on-street parking spaces, where the hourly cost of parking increases as parking becomes less available. Dynamic pricing incentivizes travelers to utilize other modes of travel during peak times, thus potentially reducing VMT. The CAPCOA Handbook for *Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* (CAPCOA 2024), finds that charging for public on-street parking or increasing the existing price of on-street parking can reduce VMT by up to 30 percent. This strategy and its associated effects are incorporated into the ABM3, which uses travel survey data to determine how the cost to operate a vehicle (including gas prices, maintenance, tolls, and parking costs) affects a traveler's choice in modes.

Dynamic pricing for on-street parking was reflected in the ABM3 results for the proposed Plan and is reflected in the VMT results outlined in Table 4.16-6. As shown, the VMT per capita, VMT per employee, and VMT per service population would decrease under the proposed Plan, which includes the effects of dynamic pricing.

It should be noted that the ABM3 does not specifically account for additional localized VMT that could be generated by additional vehicles in search for parking. Therefore, any VMT effects specifically associated with parking shortages cannot be quantified and would be dictated by local conditions, to which the model is not sensitive. The effect on VMT associated with additional vehicles circling around and looking for available parking, or cheaper parking, is likely negligible on a regional scale, and would be offset by the VMT reductions from the dynamic pricing strategy and policy described above.

2035 Conclusion

Proposed Plan pricing strategies and policies were integrated into the Year 2050 VMT results analyzed under Impact TRA-2. These VMT results were relied upon for air quality, energy, and GHG impact analyses conducted in Sections 4.3, 4.6, and 4.8. Therefore, the parking related programs included within the proposed Plans policies are anticipated to reduce VMT and better manage the existing public parking supply that is available today. Therefore, these policies would not lead to a lack of parking supply by 2035. Additionally, any secondary impacts associated with these policies were analyzed in the EIR (See Sections 4.3, 4.6 and 4.8), Thus, this impact is less than significant.

2050

Transportation Network Improvements and Programs

Dynamic pricing for on-street parking spaces is included in the pricing strategies and policies included in the proposed Plan. The proposed Plan will promote dynamic pricing, where the hourly cost of parking increases as parking becomes less available. Dynamic pricing incentivizes travelers to utilize other modes of travel during peak times, thus potentially reducing VMT. The CAPCOA Handbook for *Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* (CAPCOA 2024), finds that charging for public on-street parking or increasing the existing price of on-street parking can reduce VMT by up to 30 percent. This strategy and its associated effects are incorporated into the ABM3, which uses travel survey data to determine how the cost to operate a vehicle (including gas prices, maintenance, tolls, and parking costs) affects a traveler's choice in modes.

Dynamic pricing for on-street parking was reflected in the ABM3 results for the proposed Plan and is reflected in the VMT results outlined in Table 4.16-6. As shown, the VMT per capita, VMT per employee, and VMT per service population would decrease under the proposed Plan, which includes the effects of dynamic pricing.

It should be noted that the ABM3 does not specifically account for additional localized VMT that could be generated by additional vehicles in search for parking. Therefore, any VMT effects specifically associated with parking shortages cannot be quantified and would be dictated by local conditions, to which the model is not sensitive. The effect on VMT associated with additional vehicles circling around and looking for available parking, or cheaper parking, is likely negligible on a regional scale, and would be offset by the VMT reductions from the dynamic pricing strategy and policy described above.

2050 Conclusion

Proposed Plan pricing strategies and policies were integrated into the Year 2050 VMT results analyzed under Impact TRA-2. These VMT results were relied upon for air quality, energy, and GHG impact analyses conducted in Sections 4.3, 4.6, and 4.8. Therefore, the dynamic pricing related programs for on-street parking included within the proposed Plans policies are anticipated to reduce VMT and better manage the existing public parking supply that is available today. As such, these policies would not lead to a lack of parking supply by 2050. Additionally, any secondary impacts not already analyzed in the EIR (See Sections 4.3, 4.6 and 4.8). Thus, this impact is less than significant.

MITIGATION MEASURES

No mitigation measures are required for this impact.

4.16.5 Cumulative Impacts Analysis

C-TRA-1 MAKE A CUMULATIVE CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS TO TRANSPORTATION

The geographic scope for the transportation cumulative analysis is the Southern California and northern Baja region. Urban development and transportation systems are not bound by jurisdictional boundaries as movement within, through, and beyond the region is necessary for commuters, personal travel, and goods movement. Thus, it is important to consider both the Southern California region, as well as the connection with northern Baja California, in assessing the proposed Plan's cumulative transportation impacts.[2]

A hybrid approach for the cumulative analysis of transportation impacts allows for an overarching discussion of regional impacts associated with general patterns of regional urbanization, growth, and land use change and how the transportation network both influences, and is affected by, those regional development patterns. Discussion of

[2] It should be noted that the SANDAG model only calculates VMT within the San Diego region.

specific large-scale existing and probable future projects also allows for consideration of cumulative impacts of the proposed Plan in combination with individual projects with known impacts on transportation.

Cumulative impacts related to transportation would occur if future operating conditions of the regional transportation system, including the SANDAG, SCAG, and northern Baja regions, conflict with a program, plan, ordinance or policy addressing the circulation system; conflict with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals; substantially increase hazards due to design features; or result in loss of parking that causes significant adverse environmental impacts not evaluated elsewhere in the EIR.

This cumulative impact assessment relies on the impact analysis within this EIR for the proposed Plan; SCAG Connect SoCal 2024 (SCAG 2024a); SCAG 2025 Federal Transportation Improvement Program (SCAG 2024b); San Diego County Regional Airport Authority 2008 Airport Master Plan, San Diego International Airport, Airport Development Plan EIR (SDIA 2019); SDCRAA Aviation Activity Forecast (SDCRAA 2019); SDCRAA Regional Aviation Strategic Plan Update (SDCRAA 2011); US Environmental Protection Agency: The US–Mexico Border Environmental Program: Border 2025 (EPA 2021);; California-Baja California Border Master Plan (Caltrans 2021b); and 2034 Tijuana, Tecate, and Playas de Rosarito Metropolitan Strategic Plan (IMPLAN 2013).

Implementation of regional growth, land use change, and transportation network improvements associated with the proposed Plan would not conflict with a program, plan, ordinance or policy addressing the circulation system in 2035 or 2050. As documented in Section 4.16.3, the proposed Plan would increase multi-modal options, including bicycle, pedestrian, and transit trips within the region, in all horizon years, while reducing vehicle trips. These changes would be consistent with the policies outlined in both the Amended 2021 Regional Plan as well as Riding to 2050. In addition, the proposed Plan would not result in hazardous design features because transportation network improvements would be designed in accordance with existing standards. Nor would the proposed Plan result in loss of parking that causes significant adverse environmental impacts not evaluated elsewhere in the EIR. These impacts would be less than significant in 2035 and 2050 (Impacts TRA-1, TRA-3, and TRA-4). However, while implementation of the proposed Plan would result in a decrease in the region's VMT per capita, it will not be enough to achieve the state's VMT reduction goal of 25 percent below baseline year 2019 levels by year 2030 and 30 percent below baseline year 2019 levels by year 2045. Additionally, the proposed Plan would result in a substantial increase in the overall VMT generated by the region in all horizon years (i.e., 2030, 2035, 2045 and 2050 conditions). Therefore, this would result in a significant impact in year 2030, 2035, 2045 and 2050 conditions (Impact TRA-2).

Impacts of Related Projects

Related infrastructure improvement projects, such as the California High Speed Train Project (HST), the expansion of San Diego International Airport Terminals 1 and 2, and cross-border projects such as the State Route 11 (SR 11)/Otay Mesa East Port of Entry Project, would result in potentially significant transportation impacts. The environmental document for the HST project found that the project would have a system-wide positive effect, but localized traffic conditions around some HST system stations would experience a decrease in level of service and some added delays, and transit lines serving the station areas would experience increases in passengers during peak hours (HSR & USDOT 2005). The recirculated EIR for the Airport Development Plan concluded that implementation of that plan would result in significant and unavoidable traffic impacts (SDCRAA 2019). The State Route 11 (SR 11)/Otay Mesa East Port of Entry Project (OME POE) would create a new land POE connecting to a new four-lane toll road along SR 11. The OME POE project is intended to reduce border crossing congestion (Caltrans 2023).

Impacts of Projections in Adopted Plans

The EIR prepared for the SCAG Connect SoCal 2024 PEIR identified a significant and unavoidable impact regarding conflicts or inconsistencies with CEQA Guidelines Section 15064.3(b) due to the potential to increase total daily VMT in 2045. The EIR concluded SCAG Connect SoCal 2024 may not support the State's VMT reduction goals. The EIR also found implementation of the SCAG Connect SoCal 2024 would have cumulatively considerable transportation impacts, such as VMT, in areas outside of the SCAG region (SCAG 2024a). The SCAG 2025 FTIP is

prepared to implement projects and programs listed in the RTP and is developed in compliance with state and federal requirements (SCAG 2024b).

The 2008 Airport Master Plan, San Diego International Airport EIR identified that all traffic-related impacts related to implementation of the Airport Master Plan would be reduced to less than significant with mitigation. However, the SDCRAA lacks the legal authority to implement the identified mitigation measures as the roadway segments, intersections, and freeway ramps are within the responsibility and jurisdiction of other agencies; thus, if the agencies do not implement the measures identified in the EIR, the traffic impacts would remain significant. The EIR analyzed parking supply and did not identify significant parking impacts related to implementation of the plan or alternatives (SDCRAA 2008).

The Border 2025 Program, Master Action Plan for California-Baja California includes objectives to reduce air emissions in the border region by establishing or strengthening programs that reduce the number of vehicles that do not comply with vehicle emissions standards (EPA 2021). In addition, the 2034 Tijuana, Tecate, and Playas de Rosarito Metropolitan Strategic Plan states that a critical issue for the Baja region is the progressive deterioration of the quality of air associated with the number of vehicles and no provision of sustainable transportation (IMPLAN 2013). While there is no associated environmental documentation for these plans, the actions to improve air quality through better traffic operations and opportunities would benefit regional border transportation issues.

According to the California-Baja California Border Master Plan, there were approximately 16.6 million northbound pedestrian crossings and more than 30 million northbound privately owned vehicle crossings in 2015. Projections for the year 2040 estimate a growth of approximately 68 percent for northbound crossings and the Master Plan addresses concerns and benefits related to border planning. The Master Plan does not have associated environmental analysis documents. The Master Plan concludes that the expansion of residents in the border region will increase cross-border travel demand and continue to add pressure to the POE facilities and connecting roads. Given the current and projected travel demand at the existing POEs, improving the capacity and operations of the current infrastructure is critical to decrease traffic congestion and delays, facilitate international trade, and improve the quality of life for residents in the border region (Caltrans 2021b).

Cumulative Impacts and Impact Conclusions

Transit, Roadway, Bicycle, Pedestrian Facilities

As analyzed under TRA-1, the proposed Plan will not conflict with any program, plan, ordinance, or policy addressing the circulation system under horizon year 2035 and 2050 conditions. The policies within the other regional plans within Southern California are not applicable to the San Diego Region nor do not have the authority to change transportation related policies within the San Diego region, thus, the programs, plans, ordinances, and policies addressing the circulation system within adjacent regions are not applicable to the proposed Plan since they do not overlap. Therefore, when combining impacts of the proposed Plan, other regional plans, and related projects, a significant cumulative impact related to circulation system plans would not occur, and the proposed Plan's contribution would not be cumulatively considerable.

VMT Reductions to Meet GHG Targets

2030

As described in Section 4.16.3, implementation of the proposed Plan in 2030 would result in a significant impact because of increased total annual VMT and because regional VMT per capita would not be reduced to the levels required to meet the state's GHG reduction goals. As detailed above, there are forecasted adverse direct and cumulative transportation impacts, such as VMT, that would result from the implementation of regional plans and related projects, including the SCAG Connect SoCal 2024 Plan.

Because implementation of regional growth and land use change, as well as transportation network improvements associated with the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals and would result in a significant cumulative impact, in combination with the VMT related impacts that were also identified in adjacent regions (SCAG), he transportation impact of increased total

annual and inability to reach the State's VMT per Capita targets is cumulatively considerable between the two regions and thus significant in 2030 (Impact C-TRA-1).

2035

As described in Section 4.16.3, implementation of the proposed Plan in 2035 would result in a significant impact because of increased total annual VMT and because regional VMT per capita would not be reduced to the levels required to meet the State's GHG reduction goals. As detailed above, there are forecasted adverse direct and cumulative transportation impacts, such as VMT, that would result from the implementation of regional plans and related projects including the SCAG Connect SoCal 2024 Plan.

Because implementation of regional growth and land use change, as well as transportation network improvements associated with the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals and would result in a significant cumulative impact, in combination with VMT related impacts that were also identified in adjacent regions (SCAG), the transportation impact of increased total annual VMT and inability to reach the State's VMT per Capita targets is cumulatively considerable and thus significant in 2035 (Impact C-TRA-1).

2045

As described in Section 4.16.3, implementation of the proposed Plan in 2045 would result in a significant impact because of increased total annual VMT and because the regional VMT per capita would not be reduced to the levels required to meet the state's GHG reduction goals. As detailed above, there are forecasted adverse direct and cumulative transportation impacts, such as VMT, that would result from the implementation of regional plans and related projects including the SCAG Connect SoCal 2024 Plan.

Because implementation of regional growth and land use change, as well as transportation network improvements associated with the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals and would result in a significant cumulative impact, in combination with VMT related impacts that were also identified in adjacent regions (SCAG), the transportation impact of increased total annual VMT and inability to reach the State's VMT per Capita targets is cumulatively considerable and thus significant in 2045 (Impact C-TRA-1).

2050

As described in Section 4.16.3, implementation of the proposed Plan in 2050 would result in a significant impact because of increased total annual VMT and because the regional VMT per capita would not be reduced to the levels required to meet the state's GHG reduction goals. As detailed above, there are forecasted adverse direct and cumulative transportation impacts such as VMT that would result from the implementation of regional plans and related projects including the SCAG Connect SoCal 2024 Plan.

Because implementation of regional growth and land use change, as well as transportation network improvements associated with the proposed Plan would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals and would result in a significant cumulative impact, in combination with VMT related impacts that were also identified in adjacent regions (SCAG) the transportation impact of increased total annual VMT and inability to reach the State's VMT per Capita targets is cumulatively considerable and thus significant in 2050 (Impact C-TRA-1).

Hazards Due to a Design Feature or Incompatible Uses

As analyzed under TRA-3, the proposed Plan would not change the applicable design standards of the implementing agencies, and the transportation network improvements would be designed consistent with those standards. Further, the proposed Plan includes several planning efforts that would improve transportation safety. Therefore, impacts would be less than significant under horizon year 2035 and 2050 conditions. The design and safety standards of other regional plans within Southern California are not applicable and do not overlap with the San Diego Region. Therefore, a significant cumulative impact would not occur. Therefore, when combining

impacts of the proposed Plan, other regional plans, and related projects, a significant cumulative impact related to hazards would not occur, and the proposed Plan's contribution would not be cumulatively considerable.

Parking

As analyzed under TRA-4, the proposed Plan would not lead to a lack of parking supply that would cause significant secondary impacts not already analyzed in the EIR under Horizon Year 2035 or 2050 conditions. The parking requirements and policies of other regional plans within Southern California are not applicable and do not overlap with the San Diego Region. Therefore, when combining impacts of the proposed Plan, other regional plans, and related projects, a significant cumulative impact related to parking supply would not occur. and the proposed Plan's contribution would not be cumulatively considerable.

MITIGATION MEASURES

C-TRA-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS TO TRANSPORTATION

2030, 2035, 2045 2050

As detailed in Section 4.16.3, many features currently included in the proposed Plan (e.g., the SCS, increased transit and active transportation investments) have the effect of reducing total annual VMT that might not otherwise occur. Mitigation Measure TRA-2 would further reduce total VMT through implementation of transportation demand management strategies, reducing parking minimums, implementing additional active transportation facilities not identified in the proposed Plan (i.e., local bicycle and pedestrian facilities), and help to facilitate regional VMT credit and exchange programs. In addition, air quality mitigation measure AQ-2b and GHG mitigation measures GHG-4a, GHG-4b, GHG-4d, GHG-4e include additional feasible VMT reduction measures not included in the proposed Plan that SANDAG would or other agencies can and should implement. However, these mitigation measures would not reduce this impact (Impact-C-TRA-1) to a less-than-significant level as they would not reduce VMT per Capita of the Region to meet the State's VMT reduction targets, nor would they reduce the total VMT generated by the region to a less than significant level. Based on the above analysis and lack of further feasible mitigation, the proposed Plan's incremental contributions to cumulative transportation impacts in years 2030, 2035, 2045 and 2050 would remain significant and cumulatively considerable post-mitigation.

This page is intentionally left blank.

4.17 TRIBAL CULTURAL RESOURCES

This section evaluates the tribal cultural resources impacts of the proposed Plan.

4.17.1 Existing Conditions

PRE-EUROPEAN CONTACT SETTING

The major cultural developments in the San Diego region before the arrival of Spanish colonists in 1769 are generally discussed in three major periods (Paleoindian, or Paleoamerican; Archaic; and Late Prehistoric), each marked by certain changes in the archaeological record. These archaeological changes appear to reflect a variety of shifts in technology, settlement, and land use.

Paleoamerican Period (12,000–7000 BP)

Despite decades of research, the early prehistory of coastal Southern California remains poorly understood. The archaeological record reveals that humans appeared about 13,000 years ago on the Channel Islands, where they lived primarily by fishing and shellfishing. These early island components are of interest because they seem to reflect fully developed maritime economies that were distinct from, but roughly contemporaneous with, the Clovis tradition represented throughout much of interior North America. Identified late-Pleistocene components are lacking on the mainland coast of Southern California, although several sites have yielded calibrated dates in excess of 9,000 years (Erlandson et al. 2007: 58–59). Archaeological complexes represented at these early sites include the San Dieguito complex with its finely worked scrapers and leaf-shaped and stemmed projectile points (Byrd and Raab 2007; Warren 1968), and the La Jolla complex represented by simple flaked cobble tools, relatively abundant groundstone, and flexed burials. Although the temporal and cultural relationship between San Dieguito and La Jolla continues to be debated, human populations were well established along the coast of Southern California very early in the Holocene.

Archaic Period (7000–1200 BP)

Sea-level rise had been occurring since the last glacial maximum (about 18,000 years ago), and during the early Holocene, sea levels increased. However, by around 8000 BP, sea levels began to slow to a rate of about 0.25 meters per century, a process that allowed the formation of a complex mosaic of productive lagoon and estuary habitats at many locations along the region's coastline (Masters and Aiello 2007; Masters and Gallegos 1997). These seem to have supported a significant coastal population during the early Archaic because numerous coastal components have been found that date to this interval.

Archaeological remains in these components typically represent the La Jolla complex and often contain abundant shellfish and fish remains, along with flaked cobble tools, basin metates, manos, discoidals, stone balls, and flexed burials. At the same time, archaeological research suggests that the contemporaneous inland Pauma complex may represent seasonal movements of early Archaic populations between coastal and inland resource areas (True and Pankey 1985; Warren et al. 1961). If so, a relatively broad seasonal range is implied for the early portion of the Archaic.

Although the basic toolkit represented by the La Jolla complex appears to have remained consistent throughout the Archaic, there are some indications of significant shifts in settlement. Compilations of radiocarbon assays for Batiquitos Lagoon (Gallegos 1985; Warren et al. 1961), for example, provide evidence for disuse of this location between about 3000 and 1500 BP.

This and evidence from some other locations in the region led Warren (1964, 1968; Warren et al. 1961) and others (Gallegos 1985; Masters and Gallegos 1997) to postulate a population movement inland and southward in response to siltation and declining productivity of coastal lagoons in the northern portion of the region. More recent data, however, have demonstrated continued settlement and use of coastal resources throughout the late

Archaic period in the region's northern areas (Byrd and Reddy 2002). Rather than widespread population movement away from the coast, the changing coastal ecology may have resulted in more localized settlement adjustments.

Late Prehistoric Period (1500–1769)

In Southern California, the appearance of small, arrowhead-size projectile points and ceramics and the practice of cremation around 1,300 years ago mark the beginning of the Late Prehistoric period. Projectile points commonly found in Late Prehistoric assemblages include Cottonwood Triangular and Desert Side-Notched forms, both thought to mark the introduction of the bow and arrow into the region. Regional populations appear to have been relatively high during the Late Prehistoric, resulting in territorial restrictions, increased sedentism, and subsistence intensification. Villages were relatively stable and occupied for much of the year and were positioned for access to a variety of resource areas. Subsistence is thought to have focused on acorns and grass seeds, along with deer and a variety of small mammals. Along the coast, subsistence focused on the collection of shellfish and nearshore fishing.

Settlement patterns during the Late Prehistoric in the northern section of the San Diego region are not well understood, although the data do suggest some important spatial and temporal variation. The strongest settlement data come from the upper San Luis Rey River drainage system, where investigations by True and Waugh (1982) suggest a transition from a fairly wide-ranging mobility pattern into a territorially constricted pattern of seasonally bipolar movement between upland and lowland settlements. This interior-upland pattern is seen as distinct from that of the lower San Luis Rey River, where residential mobility is thought to have been even lower, with one principal village per group area.

ENTOGRAPHIC CONTEXT

At Spanish contact, the northern portion of the San Diego region was occupied by speakers of a Takic language related to those dialects spoken in the Los Angeles Basin to the north but distinct from the Yuman language spoken to the south in San Diego. These groups were later known generally as the Juaneño and Luiseño, based on their associations with either Mission San Luis Rey or Mission San Juan Capistrano. The region occupied by the Luiseño and Juaneño extended along the coast roughly between Agua Hedionda to approximately Aliso Creek in present Orange County, and inland approximately to Palomar Mountain. The southern coastal portion of the San Diego region was occupied by the Kumeyaay, a Yuman-speaking group also known as the Kamia, Ipai, and Diegueño (Kroeber 1925).

Juaneño

The Acjachemen (or Juaneño) lived in sedentary and autonomous village groups, each with specific subsistence territories encompassing hunting, collecting, and fishing areas. Villages were typically located in valley bottoms, along streams, or along coastal strands near mountain ranges where water was available, and villages were defensible. Inland populations had access to fishing and gathering sites on the coast, which they used during the winter months (Bean and Shipek 1978).

Acjachemen (or Juaneño) subsistence was centered around the gathering of acorns, seeds, greens, bulbs, roots, berries, and other vegetal foods. This was supplemented with hunting mammals such as deer, antelope, rabbit, woodrat, ground squirrels and mice, as well as quail, doves, ducks, and other birds. Bands along the coast also exploited marine resources such as sea mammals, fish, crustaceans, and mollusks. Inland, trout and other fish were taken from mountain streams (Bean and Shipek 1978).

Hunting was done both individually and by organized groups. Tool technology for food acquisition, storage, and preparation reflects the size and quantity of items procured. Small game was hunted with the use of curved throwing sticks, nets, slings, or traps. Bows and arrows were used for hunting larger game. Dugout canoes, basketry fish traps, and shell hooks were used for near-shore ocean fishing. Coiled and twined baskets were made for food gathering, preparation, storing, and serving. Other items used for food processing included large shallow

trays for winnowing chaff from grain, ceramic and basketry storage containers, manos and metates for grinding seeds, and ceramic jars for cooking (Bean and Shipek 1978).

Villages had hereditary chiefs who controlled religious, economic, and territorial activities (Bean and Shipek 1978). An advisory council of ritual specialists and shamans was consulted for environmental and other knowledge. Large villages located along the coast or in inland valleys may have had more complex social and political structures than settlements controlling smaller territories (Bean and Shipek 1978).

Most Acjachemen (or Juaneño) villages contained a ceremonial structure enclosed by circular fencing located near the center of the village. Houses were semisubterranean and thatched with locally available brush, bark, or reeds. Earth-covered semisubterranean sweathouses were also common and were used for purification and curing rituals (Bean and Shipek 1978).

The Acjachemen (or Juaneño) first came into contact with Europeans in 1769 when the expedition led by Gaspar de Portolá arrived in their territory. That same year, the San Diego Mission was established just to the south, followed by the San Juan Capistrano Mission in 1776 and the San Luis Rey Mission in 1798. Poor living conditions at the missions and introduced European diseases led to a rapid decline of the Luiseño population. Following the Mission Period (1769-1834), Acjachemen (or Juaneño) Indians scattered throughout southern California. Some became serfs on the Mexican ranchos, others moved to newly founded "pueblos" (towns) established for them, some sought refuge among inland groups, and a few managed to acquire land grants. Later, many moved to or were forced onto reservations. Although many of their cultural traditions had been suppressed during the Mission Period, the Acjachemen (or Juaneño) were successful at retaining their language and certain rituals and ceremonies. Starting in the 1970s, there was a revival of interest in the Acjachemen (or Juaneño) language and classes were organized. Since then, traditional games, songs, and dances have been performed; traditional foods have been gathered and prepared; and traditional medicines and curing procedures have been practiced (Bean and Shipek 1978).

Luiseño

The Luiseño lived in sedentary and autonomous village groups, each with specific subsistence territories encompassing hunting, collecting, and fishing areas. Villages were typically located in valley bottoms, along streams, or along coastal strands near mountain ranges where water was available and village defense was possible. Inland populations had access to fishing and gathering sites on the coast, which they used during the winter months (Bean and Shipek 1978).

Luiseño subsistence was centered around the gathering of acorns, seeds, greens, bulbs, roots, berries, and other vegetal foods. This was supplemented with hunting mammals such as deer, antelope, rabbit, woodrat, ground squirrels, and mice, as well as quail, doves, ducks, and other birds. Bands along the coast also exploited marine resources, such as sea mammals, fish, crustaceans, and mollusks. Inland, trout and other fish were taken from mountain streams (Bean and Shipek 1978).

Hunting was done both individually and in organized groups. Tool technology for food acquisition, storage, and preparation reflects the size and quantity of items procured. Small game was hunted with the use of curved throwing sticks, nets, slings, or traps. Bows and arrows were used for hunting larger game. Dugout canoes, basketry fish traps, and shell hooks were used for near-shore ocean fishing. Coiled and twined baskets were made for food gathering, preparation, storing, and serving. Other items used for food processing included large shallow trays for winnowing chaff from grain, ceramic and basketry storage containers, manos and metates for grinding seeds, and ceramic jars for cooking (Bean and Shipek 1978).

Villages had hereditary chiefs who controlled religious, economic, and territorial activities (Bean and Shipek 1978; Boscana 1933). An advisory council of ritual specialists and shamans was consulted for environmental and other knowledge. Large villages located along the coast or in inland valleys may have had more complex social and political structures than settlements controlling smaller territories (Bean and Shipek 1978).

Most Luiseño villages contained a ceremonial structure enclosed by circular fencing located near the center of the village. Houses were semisubterranean and thatched with locally available brush, bark, or reeds. Earth-covered

semisubterranean sweathouses were also common and were used for purification and curing rituals (Bean and Shipek 1978).

The Luiseño first came into contact with Europeans in 1769 when the expedition led by Gaspar de Portolá arrived in their territory. That same year, the San Diego Mission was established just to the south, followed by the San Juan Capistrano Mission in 1776 and the San Luis Rey Mission in 1798. Poor living conditions at the missions and introduced European diseases led to a rapid decline of the Luiseño population. Following the Mission Period (1769-1834), Luiseño Indians scattered throughout southern California. Some became serfs on the Mexican ranchos, others moved to newly founded pueblos established for them, some sought refuge among inland groups, and a few managed to acquire land grants. Later, many moved to or were forced onto reservations. Although many of their cultural traditions had been suppressed during the Mission Period, the Luiseño were successful at retaining their language and certain rituals and ceremonies. Starting in the 1970s, there was a revival of interest in the Luiseño language and classes were organized. Since then, traditional games, songs, and dances have been performed; traditional foods have been gathered and prepared; and traditional medicines and curing procedures have been practiced (Bean and Shipek 1978).

Kumeyaay

The territory of the Kumeyaay was bounded by natural geographic features, extending north from Todos Santos Bay near Ensenada, Mexico to the mouth of the San Luis Rey River in north San Diego County, and east to the Sand Hills bordering Imperial Valley and south of what is now the Mexico border, extending east to Cocopa Mountains and the Colorado delta (Luomala 1978).

The primary source of Kumeyaay subsistence was wild vegetal food supplemented with horticulture, as well as small game, including birds and fish. Ethnographic gender roles consisted of men hunting and producing weapons and women gathered wild plants and cultivated the fields. Women also processed and cooked food, utilizing a variety of containers and implements including basketry and plainware or decorated reddish-brown ceramic pottery. Seasonal travel followed the seasonal round and extended vertically, wherein plants were gathered from the lowlands areas in the fall and winter, and families would travel up to the higher mountainous elevations in the spring and summer. Similar to other indigenous Californians, acorns were a primary staple of their diet; indeed, acorns were gathered from six oak trees common to the region. Acorns were processed via a grinding and leaching system and then cooked through a variety of methods, including baking, boiling, and stewing to form bread, soups, stews, mush and gruel. In addition to acorns, mesquite pods, sage seeds, cacti seeds, and grass seeds were all processed into flour. Buds, blossoms, potherbs, agave, wild onion, yucca, cactus fruits, including prickly pears, piñon, and wild plums were among the diet of both groups (Luomala 1978). Although wild gathered plants formed the majority of their diet, the Kumeyaay also practiced limited horticulture within the floodplain areas of their territory, growing such crops as Melons, maize, beans, cowpeas, and teparies (beans). Women sometimes transplanted wild onion and tobacco plants to convenient locations and sowed wild tobacco seeds. The Kumeyaay also practiced deliberate burning of grassland areas in order to propagate seeds. Although less common, larger game primarily including deer were hunted, however, the majority of hunted game consisted of small to medium mammals, such as rodents, rabbits, lizards, insects, and larvae. Birds, including quail, geese, doves and hawks were also caught and consumed. Groups living near coastal or riverine resources fished (Luomala 1978).

Village locations varied from temporary campsites built for mobility and to gather and forage local vegetal resources, to more permanent locales. They were chosen based on several advantageous factors including proximity to good sources of perennial freshwater as well as resource patches and gathering areas. Of equal importance was the location in relation to natural geologic features such as outcroppings, which offer additional protection from would-be attackers. Villages were occupied by exogamous, patrilineal clans. Three or four clans would winter together, then disperse into smaller bands during the spring and summer (Luomala 1978). Like village type, Kumeyaay structures varied with the seasons and region. Summer shelters were of more simple construction and consisted of a wind break, tree, or a cave fronted with rocks. Winter dwellings were built with more permanence and protection from the elements in mind, and had slightly sunken floors with dome-shaped structures made of brush thatch covered with grass and earth. Southern groups, such as those near the Sloughs,

built rectangular-sand covered dwellings, while palm-leaf thatched houses were built in desert areas. The chief usually had the biggest dwelling. The ceremonial structure was communally owned by the village. Dance grounds, owned by clans, were encircled by a rock and brush fence (Gifford 1931; Luomala 1978).

Kumeyaay organization was based upon autonomous tribelets, or bands, each of which had a clan chief and an assistant chief. This position could be hereditary, or one chosen by consensus. The chief's job was to help facilitate conflicts, provide guidance to the band in matters of spiritualism and ceremony, and mediate marriages and conflicts. Another important position within the village was hunt master, a hereditary position based down from father to son, which entailed leading communal hunts and drives and learning specific skills and rituals related to hunting. Everyone in the tribelet had a right to water as well as cached foods, provided they would reciprocate at a later time. Lands and springs were communally owned by the band, however, certain resources within band territory could be claimed by a specific clan or family. Clans did own what they had made or gathered (Luomala 1978). Upon death, the Kumeyaay cremated the body of the deceased. Families may have practiced gift-giving during this primary stage of mourning. Songs were sung throughout the night, speeches were made, and mourners wailed. Once cremated, the individual's ashes were placed in a ceramic urn and buried or hidden in a cluster of rocks. After this ceremony, the deceased loved ones name was not spoken again, and their dwelling was burned to the ground and subsequently avoided. The family customarily held a mourning ceremony one year after the death of a family member. During this ceremony, the clothes of the deceased individual, as well as items that were not previously burned, were burned to ensure that the spirit would not return for his or her possessions. During this ceremony, mourners wailed, sang song cycles, and performed one last dance for the departed spirit (Gifford 1931; Luomala 1978).

It is estimated that the precontact Kumeyaay population ranged from as little as approximately 3,000 (Kroeber 1925) to as many as 9,000 (Luomala 1978). Although avoiding direct impacts from European and Euro-American colonizers, change came to this region as well. Beginning in 1775, the semi-nomadic life of the Kumeyaay was altered as a result of contact with European-Americans, particularly from the influence of the Spanish missions. Despite much resistance from the Kumeyaay, including the burning of San Diego Mission in 1775 by a group of 800 people from 70 villages, the mission system continued and by 1779, San Diego Mission had 1,405 neophytes living in proximity to the mission. Through successive Spanish, Mexican, and Anglo-American control, the Kumeyaay, especially in less remote locales, were forced to adopt a sedentary lifestyle and accept Christianity (Luomala 1978). As of 1968, the Kumeyaay population was somewhere between approximately 1,322 (Shipek 1972, included in Luomala 1978) and 1,522 (Luomala 1978).

ETHNOGRAPHIC RESOURCES AND SACRED SITES

Ethnographic resources that are potential tribal cultural resources include sites, areas, and materials important to Native Americans for religious, spiritual, or traditional uses. These can encompass the sacred character of physical locations (mountain peaks, springs, and burial sites) or particular native plants, animals, or minerals that are gathered for use in traditional ritual activities. Villages, camps and activity areas, burials, rock art, rock features, and traditional hunting, gathering, or fishing sites may also constitute significant California Native American cultural resources. Tribal cultural resources tend to fall into distinctive categories that relate to cosmology or activities that took place. They are found throughout the region but tend to be physical geographic landmarks or in areas close to a water source or resources (such as materials for tool making or readily available food) and on flatter ground. Tribal cultural resources can be found on the surface or buried. Tribal cultural resources close to water sources that were originally just superficial can be buried over time by alluvial action.

Tribal cultural resources are more likely to have been destroyed in historic urbanized and commercial areas; namely along the highly developed coastal region, although this does not preclude the presence in urban or developed settings of buried archaeological resources that may meet the definition of a tribal cultural resource. A greater number of surficial tribal cultural resources and buried archaeological tribal cultural resources are more likely to have been previously documented as traditional cultural places, sacred sites, or archaeological sites resulting from cultural resources studies and outreach to Native Americans during environmental analysis for previous projects throughout the region. In addition, tribal cultural resources that have not been documented or

evaluated may be in the Plan area. Large portions of the Plan area have not been subjected to cultural resource surveys or consultations with California Native American tribes and therefore may contain tribal cultural resources. Additionally, there are likely a number of documented archaeological resources, landscapes, and sacred places that have not been evaluated as tribal cultural resources.

The Native American Heritage Commission (NAHC) maintains the Sacred Lands File (SLF), a confidential inventory of California Native American sacred sites, which may be indigenous material sites, cultural landscapes, locations used for traditional resource gathering, or sacred places. An unknown number of these sites may meet the definition of a tribal cultural resource. A search of the NAHC's SLF completed for the Plan area was obtained from the NAHC on August 13, 2018. Results of the SLF search indicate that California Native American cultural sites are present in the Plan area. The specific locations and descriptions of the sites are confidential. The NAHC also provided a list of tribes that are traditionally and culturally affiliated with the geographic area of the proposed Plan.

4.17.2 Regulatory Setting

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

Health and Safety Code, Section 7050.5

Section 7050.5 of the Health and Safety Code requires that construction or excavation be stopped in the vicinity of discovered human remains until the coroner can determine whether the remains are those of a Native American. If they are determined to be those of a Native American, the coroner must contact the NAHC by telephone within 24 hours. It is a misdemeanor to knowingly remove, disturb, or disinter human remains from any location other than a dedicated cemetery without legal authorization.

California Native American Historical, Cultural, and Sacred Sites Act

The California Native American Historical, Cultural, and Sacred Sites Act (PRC Section 5097.9–5097.991) applies to both state and private lands. The act requires, upon discovery of human remains, that construction or excavation activity cease and that the county coroner be notified. If the remains are those of a Native American, the coroner must notify the NAHC, which notifies (and has the authority to designate) the most likely descendants of the deceased. The act stipulates the procedures the descendants may follow for treating or disposing of the remains and associated grave goods. Guidance on tribal consultation under this act is further detailed in the California Office of Planning and Research's LCI Technical Advisory on AB 52.

Public Resource Code Section 5097

PRC Sections 5097 through 5097.7 specify the procedures to be followed in the event of the unexpected discovery of human remains on nonfederal land. The disposition of California Native American human burials falls within the jurisdiction of the NAHC. Section 5097.5 of the code states the following:

> No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.

AB 52 and Tribal Cultural Resources

Assembly Bill 52 (AB 52), enacted in 2014, amended CEQA to recognize tribal cultural resources as a new category of cultural resources (PRC Sections 21074 and 21083.09). CEQA requires public agencies to consider the effects of their actions on tribal cultural resources. PRC Section 21084.2 establishes that "[a] project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment." PRC Section 21074 states:

a) "Tribal cultural resources" are either of the following:

   1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe that are either of the following:

      A) Included or determined to be eligible for inclusion in the CRHR.

      B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.

   2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American Tribe.

b) A cultural landscape that meets the criteria of subdivision (a) is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape.

c) A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a "nonunique archaeological resource" as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

AB 52 also established a formal consultation process between lead agencies and California Native American tribes that are traditionally and culturally affiliated with a project area (PRC Sections 21074, 21080.3.1–21080.3.2, 21082.3, and 21084.3). Also, as required by AB 52, the Governor's Office of Land Use and Climate Innovation (LCI) (formerly known as the Governor's Office of Planning and Research) updated Appendix G of the State CEQA Guidelines to provide sample questions regarding impacts on tribal cultural resources (PRC Section 21083.09).

Under AB 52, lead agencies must notify tribes that have requested consultation within 14 days of determining that an application for a project is complete or a notice of preparation is filed (PRC Section 21080.3.1). Tribes then have 30 days to request consultation. Once consultation is initiated, the tribe and lead agency may discuss, for example:

- the significance of the project's potential impacts on tribal cultural resources
- the significance of the resource
- possible alternatives or mitigation measures to reduce those impacts.

According to PRC Section 21080.3.2(a), the consultation may include the type of environmental review, the significance of tribal cultural resources and potential impacts, and any alternatives or preservation or mitigation measures the tribe may recommend to the lead agency (PRC Section 21080.3.2[a]).

If consultation leads to agreed-upon mitigation, those measures must be included in the environmental document (PRC Section 21082.3[a]). If the recommended mitigation is not included in the environmental document, if no mitigation measures were agreed upon in consultation, or if no consultation occurred, and if the proposed project would cause a significant impact on a tribal cultural resource, the lead agency must consider feasible mitigation measures pursuant to PRC Section 21084.3 (PRC Section 21082.3[e]). If no agreement is reached and no feasible mitigation is available, the agency must document this before approving the project. LCI also updated CEQA Guidelines to help agencies evaluate potential impacts on tribal cultural resources.

PRC Section 21084.3 requires agencies to avoid damaging effects to any tribal cultural resource, when feasible, and provides examples of mitigation measures that, if feasible, may be considered to avoid or minimize the significant adverse impacts:

1. Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
2. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, consisting of, but not limited to, the following:

a. protecting the cultural character and integrity of the resource
b. protecting the traditional use of the resource
c. protecting the confidentiality of the resource

3. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
4. Protecting the resource.

California Government Code Sections 7927.000 and 7927.005

These sections of the California Public Records Act help protect archaeological sites from unauthorized excavation, looting, or vandalism. California Government Code Section 7927.000 allows public agencies to withhold records related to California Native American graves, cemeteries, and sacred places, and records related to any Native American sanctified cemetery, place of worship, religious or ceremonial site, or sacred shrine located on public property, where such records are maintained by the NAHC. Section 7927.005 exempts from disclosure any records about archaeological site information or reports maintained by, or in the possession, agencies such as the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the NAHC, or any local or state agency. This includes records obtained through consultation between a California Native American tribe and a state or local agency.

LOCAL JURISDICTIONS' PRESERVATION POLICIES AND REGULATIONS

County of San Diego: Resource Protection Ordinance (RPO)

The RPO (San Diego County Code of Regulatory Ordinances Sections 86.601–86.608) mandates the evaluation of cultural resources during the county's environmental review process. Significant sites, including those of tribal cultural importance, must be preserved. Section 86.604(g) of the ordinance prohibits grading, excavation, or other damaging activities on such sites except for scientific research conducted under an approved research design by a qualified archaeologist.

County of San Diego: Grading, Clearing, and Watercourses Ordinance

This ordinance requires that grading operations cease if human remains or materials of cultural significance to California Native American tribes are discovered during construction. (San Diego County Code of Regulatory Ordinances Section 87.429). Additionally, grading plans must be modified if unanticipated cultural resources are found, and appropriate mitigation measures must be implemented in coordination with the county and tribal representatives. (San Diego County Code of Regulatory Ordinances Section 87.216(a)(7)).

County of San Diego: Conservation and Open Space Element of the San Diego County General Plan

The Conservation and Open Space Element of the County of San Diego's General Plan includes goals and policies that recognize the importance of protecting cultural resources, including those of significance to California Native American tribes. Goal COS-7 states "Identify, preserve, and protect the County's important cultural resources." Policy COS-7.1 further emphasizes that the County shall "consult with Native American tribes and other interested parties early in the planning process to identify and address potential impacts to cultural resources." The Open Space Element encourages early identification of cultural sites during planning, emphasizes preservation in place as the preferred form of mitigation, and promotes consultation with tribal representatives to ensure that tribal values and traditional knowledge are considered in land use decisions. This Plan includes goals and policies that recognize the importance of protecting cultural resources, as described in the Conservation and Open Space Element of the County of San Diego General Plan (County of San Diego 2011).

County of San Diego: Local Register of Historical Resources

San Diego County maintains a local register of historical resources, which includes sites of local cultural significance. Properties listed in or eligible for the CRHR or the National Register of Historic Places are automatically included. Resources may also be added based on local criteria, including those significant to California Native American tribes.

Local Ordinances in San Diego County

Multiple cities in San Diego County have adopted ordinances that address the protection of historical and cultural resources, including those with tribal cultural significance. Table 4.5-2 lists preservation policies and regulations from jurisdictions across the region. For illustrative purposes, the City of San Diego's approach is summarized below. See also Table 4.5-2 for additional local ordinances.

The City of San Diego's Municipal Code Chapters 11, 12, and 14 establish the Historical Resources Board, designation processes, and development standards for historic resources. These regulations aim to protect, preserve, and restore historical resources, including traditional cultural properties. The city provides explicit guidelines for managing historical resources, including methodologies for assessing impacts and appropriate mitigation strategies. These guidelines are designed to ensure consistency in the management of the city's historical resources, which includes traditional cultural properties, which are often associated with those of tribal cultural significance.

4.17.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts, in the form of initial study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the checklist questions that address the criteria in CEQA Guidelines Appendix G. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR, and the unique characteristics of the proposed Plan and EIR.

Checklist questions for tribal cultural resources are provided in Section XVIII of CEQA Guidelines Appendix G. Criterion (a)(i) addresses tribal cultural resources that are listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in PRC Section 5020.1(k). Criterion (a)(ii) addresses tribal cultural resources determined to be significant by the lead agency consistent with criteria set forth in PRC Section 5024.1 and the significance of the resource to a California Native American tribe. SANDAG has combined these checklist questions into TCR-1.

For purposes of this EIR, implementation of the proposed Plan would have a significant tribal cultural resource impact if it would result in the following:

TCR-1 Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is either (1) listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k); or (2) determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1.

The analysis discloses impacts to tribal cultural resources. There is insufficient evidence to support a meaningful analysis of how the proposed Plan's tribal cultural resources impacts would be worsened by climate change. Therefore, a climate change analysis for tribal cultural resources impacts is not included in this section.

4.17.4 Environmental Impacts and Mitigation Measures

TCR-1 CAUSE A SUBSTANTAL ADVERSE CHANGE IN THE SIGNIFICANCE OF A TRIBAL CULTURAL RESOURCE, DEFINED IN PUBLIC RESOURCES CODE SECTION 21047 AS EITHER A SITE, FEATURE, PLACE, CULTURAL LANDSCAPE THAT IS GEOGRAPHICALLY DEFINED IN TERMS OF THE SIZE AND SCOPE OF THE LANDSCAPE, SACRED PLACE, OR OBJECT WITH CULTURAL VALUE TO A CALIFORNIA NATIVE AMERICAN TRIBE, AND THAT IS EITHER (1) LISTED OR ELIGIBLE FOR LISTING IN THE CALIFORNIA REGISTER OF HISTORICAL RESOURCES, OR IN A LOCAL REGISTER OF HISTORICAL RESOURCES AS DEFINED IN PUBLIC RESOURCES CODE SECTION 5020.1(K); OR (2) DETERMINED BY THE LEAD AGENCY, IN ITS DISCRETION AND SUPPORTED BY SUBSTANTIAL EVIDENCE, TO BE SIGNIFICANT PURSUANT TO CRITERIA SET FORTH IN SUBDIVISION (C) OF PUBLIC RESOURCES CODE SECTION 5024.1

Analysis Methodology

This analysis examines the impacts on tribal cultural resources that would result from implementation of the proposed Plan.

Although tribal cultural resources may differ from other types of cultural resources, cultural resources records searches and outreach to the NAHC can identify previously reported cultural resources that may be tribal cultural resources. The impact analysis is based on the NAHC SLF search completed for the proposed Plan and AB 52 consultation conducted between SANDAG and consulting tribes. Information obtained from the NAHC and through tribal consultation, including records searches and outreach to tribes, may help identify resources that qualify as tribal cultural resources under CEQA (Governor's Office of Planning and Research [OPR] 2020). Cultural resources records searches, along with information obtained through outreach to the NAHC and consultation with tribes, may help identify resources that qualify as tribal cultural resources under CEQA. These may include resources listed or eligible for listing in the CRHR or a local register, but may also include resources identified by California Native American tribes as culturally significant based on tribal knowledge and tradition, consistent with PRC Section 21074. Evidence that may support such a finding could include elder testimony, oral history, tribal government archival information, testimony of a qualified archaeologist certified by the relevant tribe, testimony of an expert certified by the tribal government, official tribal government declarations or resolutions, formal statements from a certified Tribal Historic Preservation Officer, or historical/anthropological records. (LCI, 2020).

PRC Section 21084.2 establishes that "[a] project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment." A substantial adverse change to the significance of a historical resource is defined as the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource would be materially impaired (CEQA Guidelines Section 15064.5); this definition can also be applied to a substantial adverse change to a tribal cultural resource.

Construction activities are more likely to disturb tribal cultural resources than operations activities because tribal cultural resources are most likely to be encountered during initial ground disturbance. For forecasted regional growth and land use change projects, as well as planned transportation network improvements, the likelihood of encountering tribal cultural resources is thus analyzed based on whether projects would require grading, excavation, or other ground-disturbing activities. Even minimal grading activities can encounter resources, as they have been discovered only inches below the surface. Ground-disturbing activities associated with infill, redevelopment, and infrastructure expansion have the potential to unearth these resources.

Impacts of operations activities on tribal cultural resources are unlikely to be significant, unless they impose a sustained change to the setting or viewshed of a tribal cultural resource (thereby affecting the integrity of its setting and its significance).

Results of the Regional Plan AB 52 Consultation Process

SANDAG regularly coordinates with the Interagency Technical Working Group on Tribal Transportation Issues (Working Group). The Working Group is composed of a representative from each federally recognized tribal government and California tribe in San Diego County that chooses to participate in the Working Group, and serves as a forum for tribal governments in the region to discuss and coordinate transportation issues of mutual concern with the various public planning agencies in the region. The Working Group is co-chaired by a tribal member and a member of the SANDAG executive staff. Tribal representatives are voting members of the Working Group, and SANDAG and other public agencies involved in tribal transportation issues serve as advisory members of the Working Group. The Working Group meets quarterly, as determined by the group. These meetings are not formal consultation pursuant to AB 52, but instead implement a tribal consultation plan developed by the Southern California Tribal Chairmen's Association and SANDAG intended to guide consultation with tribes on regional transportation issues, including the development of the proposed Plan.

As part of formal AB 52 consultation, on January 19, 2023, SANDAG sent letters to 26 tribes to invite them to formal consultation under AB 52 on the EIR for the 2025 Regional Plan:

- Agua Caliente Band of Cahuilla Indians,
- Barona Band of Mission Indians,
- Cahuilla Band of Indians,
- Campo Band of Mission Indians,
- Chemehuevi Indian Tribe,
- Ewiiaapaayp Band of Kumeyaay Indians,
- Iipay Nation of Santa Ysabel,
- Inaja Band of Diegueño Mission Indians,
- Jamul Indian Village of California,
- Kwaaymii Laguna Band of Mission Indians,
- La Jolla Band of Luiseño Indians,
- La Posta Band of the Kumeyaay Nation,
- Los Coyotes Band of Cahuilla Cupeno Indians,
- Manzanita Band of the Kumeyaay Nation,
- Mesa Grande Band of Mission Indians,
- Pala Band of Mission Indians,
- Pauma Band of Luiseño Indians,
- Rincon Band of Luiseño Indians,
- San Luis Rey Band of Mission Indians,
- San Manuel Band of Mission Indians,
- San Pasqual Band of Diegueño Mission Indians,
- Santa Rosa Band of Cahuilla Indians,
- Soboba Band of Luiseño Indians,
- Sycuan Band of the Kumeyaay Nation,
- Torres Martinez Desert Cahuilla Indians, and
- Viejas Band of Kumeyaay Nation.

These letters constituted formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that requested notice, pursuant to PRC 21080.3.1. The letter stated that while the 2025 Regional Plan would be developed consistent with the Tribal Consultation Plan developed by the Southern California Tribal Chairmen's Association and SANDAG, the invitation to conduct AB 52 tribal cultural resource consultation on the Regional Plan EIR was separate from, and in addition to, the collaborative efforts among the tribal governments and SANDAG on development of the 2025 Regional Plan.

Three responses were received. The Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians) emailed SANDAG on January 17, 2023, informing SANDAG that the location of the proposed project was located outside of Serrano ancestral territory and, as such, the Yuhaaviatam of San Manuel Nation would not be requesting to receive consulting party status or to participate in the scoping, development, or review of documents created pursuant to legal and regulatory mandates, thus concluding consultation efforts. The Agua Caliente Band of Cahuilla Indians Tribal Historic Preservation Office emailed SANDAG on January 26, 2023, stating that a records check of the cultural registry revealed that the project is not located within the tribe's Traditional Use Area and that they would defer to the other tribes in the area, thus concluding consultation efforts. The Rincon Band of Luiseño Indians emailed SANDAG on March 9, 2023, and requested consultation. SANDAG and the Rincon Band of Luiseño Indians met virtually on May 26, 2023. At that meeting consultation was held and

concluded on the Supplemental EIR for the Amendment to the 2021 Regional Plan. Also, at that meeting SANDAG consulted on the 2025 Regional Plan EIR. The Rincon Band of Luiseño Indians expressed the desire to engage in the ongoing consultation on the 2025 Regional Plan EIR and be notified of any future listening sessions or workshops on the EIR. Subsequent updates and discussion on the 2025 Regional Plan were facilitated at Tribal Working Group meetings, and meetings were held with the Rincon Band of Luiseño Indians in April and May of 2024.. SANDAG reached out to the Rincon Band of Luiseño Indians on August 19, 2025 to discuss closing consultation. Additional discussions were held between August 19th through 21st , 2025, the outcome of which was to continue consultation. An additional meeting date was set for August 26, 2025, and further materials were requested from SANDAG by the Rincon Band of Luiseño Indians.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Regional growth and land use change would result in potential impacts to tribal cultural resources resulting from a wide variety of construction and ground-disturbing activities, such as grading, excavation, and clearing, which remove or disturb soils and sediments. The likelihood of encountering archaeological tribal cultural resources is greatest for projects that include grading or excavation of areas on which past grading or excavation activities have been minimal. However, development and ground-disturbing activities associated with infill, redevelopment, or expansion of infrastructure also have the potential to impact tribal cultural resources. Because archaeological sites have been found within inches of the ground surface throughout the San Diego region, even minimal grading activities can impact these resources. Excavation and soil removal of any kind, irrespective of depth, have the potential to yield archaeological tribal cultural resources. In addition to the potential for identifying buried tribal cultural resources in urbanized areas of the proposed Plan, such as Downtown San Diego, Chula Vista, and National City, the additional growth forecasted in the less developed portions of the San Diego region, such as Otay and North County Metro, may occur in areas where tribal cultural resources are present.

Tribal cultural resources may have been previously documented as archaeological sites, cultural landscapes, areas of traditional natural resource gathering, or sacred sites, and may be identified only through future consultation with California Native American tribes. A search of the NAHC's SLF completed for the Plan area was obtained from the NAHC on August 13, 2018. Results of the SLF search indicate that California Native American cultural sites are present in the Plan area. The specific locations and descriptions of the sites are confidential. Regional growth and land use changes through 2035 are anticipated to result in significant impacts on tribal cultural resources across the region. This is due to the potential for ground-disturbing activities to unearth previously unidentified tribal cultural resources and the possibility of indirect impacts on culturally sensitive landscapes that are tribal cultural resources.

Adherence to the existing laws, regulations, and programs discussed in Section 4.17.2, "Regulatory Setting," and consultation with California Native American tribes can help avoid or reduce impacts on tribal cultural resources by facilitating early identification of such resources, allowing for project design modifications or avoidance measures, and ensuring that tribes have input into mitigation strategies during construction of development projects associated with regional growth and land change. Given the potential for land use changes to cause substantial adverse changes in the significance of a tribal cultural resource coupled with the nonrenewable nature of these resources if disturbed or altered, implementation of the proposed Plan would result in ground-disturbing

activities and changes in setting related to regional growth and land use change that would cause a substantial adverse change in the significance of a tribal cultural resource. This is a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR-67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER.

As stated previously, numerous cultural resources have been documented in the San Diego region, some of which may be identified as tribal cultural resources during tribal consultation, and the potential exists for undocumented tribal cultural resources to be discovered. Given the region's rich cultural setting, construction of transportation network improvements included in the proposed Plan would likely encounter these resources.

Some of the improvements in the proposed Plan completed between 2022 and 2035 would involve only operations changes that would not require construction of new transportation or transit facilities, such as increasing service frequencies or creating new transit routes, and therefore would have little impact on tribal cultural resources. However, improvements that would involve construction of new infrastructure or facilities could encounter tribal cultural resources.

Direct permanent impacts on tribal cultural resources may result from ground disturbance associated with construction, such as grading and excavation, for the planned transportation improvements stemming from the proposed Plan. The development of new transportation facilities, construction of additional lanes, or upgrades to existing facilities may have a relatively higher potential to directly impact tribal cultural resources of an archaeological nature, primarily by grading or excavation in previously undisturbed soil and by the disturbance of buried resources that have not been previously identified.

Transportation construction projects, such as double-tracking at certain locations on the LOSSAN Rail Corridor and construction for the Central Mobility Hub and San Ysidro Mobility Hub, as well as numerous road projects and improvements, would require grading, and potentially trenching, activities that remove or disturb the upper layer of soils and could unearth underlying tribal cultural resources of an archaeological nature, areas of traditional natural resource gathering, or sacred places. Improvements along the I-5 corridor have the potential to impact tribal cultural resources that may be present along the shores, estuaries, lagoons, and bluffs of the San Diego coastline. Direct impacts would be significant if tribal cultural resources cannot be avoided or preserved in place by project design or redesign and are destroyed or substantially altered. Additional major transportation network improvements that could impact tribal cultural resources include new Managed Lanes and Managed Lane connectors on SR 52, SR 78, I-5, I-15, I-805. Direct access ramps are assumed at I-15/Clairemont Mesa Boulevard; I-5/Voigt Drive; and I-15/San Diego State University West. Shoulder-widening and straightening improvements on SR 67 from Mapleview to Dye Rd, and additional improvements to local arterial streets. These projects also have the potential to impact tribal cultural resources resulting from ground disturbance or demolition. The potential for direct impacts on tribal cultural resources may be lower for improvements to existing facilities and modifications to existing roads because these areas have been previously disturbed. However, even if previously disturbed, excavation at depth has the potential to directly impact undocumented tribal cultural resources of an archaeological nature.

Direct impacts would be significant if tribal cultural resources cannot be avoided or preserved in place by project design or redesign and are destroyed or substantially altered such that the significance of the resource would be materially impaired. Disturbance of tribal cultural resource features or places could result in impacts on the traditional use or the cultural character and integrity of the resource and may result in a significant impact if its

contributing characteristics or the character of its physical setting is destroyed or substantially altered such that the significance of the resource would be materially impaired. Permanent direct impacts may be addressed by advance project planning and consulting with tribes that have requested consultation to ensure known tribal cultural resources are identified, avoided, and preserved in place or to develop project alternatives that would minimize impacts on known tribal cultural resources. Permanent direct impacts on tribal cultural resources discovered inadvertently during project construction may be addressed by project redesign to avoid and preserve the resource and by tribal consultation focused on minimizing the impact.

Indirect impacts from construction and operations improvements may result from potential access-related damage to tribal cultural resources when public accessibility increases because of improved transportation networks stemming from the proposed Plan, for example, off-street bike trail projects that take users through open space, like the Oceanside Inland Rail Trail. The likelihood of unauthorized artifact collecting and destruction (intentional or unintentional) of tribal cultural resources of or of damage to or destruction (intentional or unintentional) of tribal cultural resources that are traditional places for gathering natural resources, cultural landscapes, or sacred places increases with improved access. Recreational use, overland vehicle travel, and vandalism have the potential to degrade the integrity and traditional use of the tribal cultural resources. Ensuring that appropriate measures are devised during project planning that would minimize or reduce damage to tribal cultural resources, coupled with requested tribal consultation, may reduce indirect access-related impacts. However, operational impacts associated with increased public access, such as vandalism or inadvertent damage, are anticipated to be limited in extent and geographic scope. These impacts would not constitute a substantial adverse change in the significance of a tribal cultural resource under CEQA and are therefore considered less than significant.

Given the magnitude and location of several of the transportation network improvements and programs occurring between 2022 and 2035, additional ground disturbances are anticipated. As a result, additional tribal cultural resources would be encountered during construction activities between 2022 and 2035. For example, regional growth through 2035 could increase recreational use of open space areas, which in turn could promote erosion or increase the likelihood of damage to tribal cultural resources through increased foot traffic and public access.

Although adherence to the existing laws, regulations, and programs discussed in Section 4.17.2 would reduce impacts on tribal cultural resources upon implementation of the proposed Plan, the is a likelihood that they would not reduce these impacts to a less-than-significant level for all future projects under the proposed Plan. Given the potential for transportation facilities to cause substantial adverse changes in the significance of tribal cultural resources, coupled with the nonrenewable nature of these resources if disturbed or altered, implementation of the proposed Plan would result in ground-disturbing activities and increased access related to transportation network improvements and programs that would cause a substantial adverse change in the significance of a tribal cultural resource. This is a significant impact.

2035 Conclusion

Implementation of the proposed Plan would result in regional growth and land use change and transportation network improvements and programs that could cause a substantial adverse change in the significance of a tribal cultural resource. Therefore, this impact (TCR-1) in the year 2035 is significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0, "Project Description," of this Draft EIR, from 2036 to 2050, regional population is forecast to decrease by 4,112 people (-0.1%), while housing units are projected to increase by 65,577 (4.8%) and employment is forecasted to increase by 103,460 (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5 in Chapter 2, "Project Description." The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated county, and the cities of Carlsbad and El Cajon. Approximately 78.8% of new housing units are in the cities of San Diego (51.6%) and Chula Vista (17.1%)

and the unincorporated county. Similarly, these same two jurisdictions contribute to approximately 70.3% of new jobs between 2036 and 2050.

As discussed in the 2035 analysis, many areas throughout the San Diego region have a high potential to contain tribal cultural resources. In addition to the resource-sensitive areas mentioned in the 2035 analysis, the additional growth forecasted in both the unincorporated county and western portion of the region between 2035 and 2050 would result in new development in areas such as Otay, and redevelopment in established urban areas such as Downtown, Kearny Mesa, and Midway-Pacific Highway. Additional construction and ground-disturbing activities, such as excavation, grading, clearing, demolition, alteration, and structural relocation, would occur with the potential to directly impact tribal cultural resources. Ground-disturbing activities associated with infill, redevelopment, or expansion of infrastructure have the potential to impact tribal cultural resources, as do changes in setting. Forecasted growth and land use change, as well as changes in setting, would also result in indirect physical impacts on open space areas, such as in the Otay planning area, and thus increase the likelihood of physical impacts on tribal cultural resources located in those areas. For instance, increased recreational use of open space areas could promote erosion or increase the likelihood of damage to tribal cultural resources through increased traffic (foot or otherwise). Regional growth and development through 2050 are anticipated to result in significant cumulative impacts on tribal cultural resources across the region. This is due to the potential for ground disturbing activities to unearth previously unidentified tribal cultural resources and the possibility of indirect impacts on culturally sensitive landscapes. The proposed Plan would contribute to these cumulative impacts by facilitating new development that involves ground disturbance in areas with known or potential tribal cultural resources. Therefore, the Plan's contribution to the significant cumulative impact on tribal cultural resources would be considered cumulatively considerable under CEQA. With additional growth and increased development intensities, and increased use of open space areas, the extent of impacts on tribal cultural resources between 2036 and 2050 would be greater than that experienced by 2035 as more resource-sensitive land would be disturbed over time.

As more land is disturbed and altered for new development and redevelopment between 2036 and 2050, the possibility of irreversible losses of significant tribal cultural resources becomes greater. As discussed in the 2035 analysis, although adherence to the existing laws, regulations, and programs would reduce impacts on tribal cultural resources upon implementation of the proposed Plan, there remains a likelihood that this would not reduce these impacts to a less-than-significant level for all future projects. Given the potential for land use changes to cause substantial adverse changes in the significance of tribal cultural resources, coupled with the nonrenewable nature of these resources if disturbed or altered, implementation of the proposed Plan would result in ground-disturbing activities and changes in setting related to regional growth and land use change that would cause a substantial adverse change in the significance of a tribal cultural resource. This is a significant impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period.

As with the 2035 analysis, there is a likelihood that identified and unidentified tribal cultural resources would occur in transportation network improvement and program areas scheduled for implementation between 2036 and 2050. Projects that would involve construction of new infrastructure or facilities could result in impacts. Major rail projects and improvements, such as continued double-tracking along certain LOSSAN corridor locations and construction of the Purple Line, have the potential to impact tribal cultural resources resulting from ground disturbance or disturbance of tribal cultural resource features or places. Highway improvements, such as Managed Lane construction along I-5, I-15, I-805, SR 52, and SR 56, would require grading and, potentially, trenching activities that remove or disturb the upper layer of soils, and could encounter underlying archaeological tribal cultural resources. Widening and road straightening along rural highways, such as SR 76, SR 79, SR 94, and I-8,

would occur in areas that have seen relatively little development and would disturb new ground. Such construction activities are more likely to disturb tribal cultural resources than construction areas in previously developed areas because tribal cultural resources are most likely to be encountered during initial ground disturbance. Direct impacts would be significant if tribal cultural resources cannot be avoided or preserved in place by project design or redesign and are destroyed or substantially altered. Disturbance of tribal cultural resource features or places could impact the traditional use, or the cultural character and integrity, of the resource and may result in a significant impact if their contributing characteristics or the character of their physical setting is destroyed or substantially altered such that the significance of the resource would be materially impaired.

Indirect impacts from construction and operational improvements may result from increased public accessibility to areas that contain tribal cultural resources. Improved transportation networks under the proposed Plan, for example, off-street bike trail projects that take users through open space, like the proposed San Luis Rey River Trail, could lead to unauthorized access, artifact collecting, and intentional or unintentional damage to tribal cultural resources. These areas often hold cultural and spiritual significance as traditional gathering places for gathering natural resources or sacred landscapes, and increased access has the potential to degrade their integrity. These operational access-related impacts on tribal cultural resources are considered significant under CEQA. However, ensuring that appropriate measures are integrated into project planning, such as avoidance, design modifications, and early tribal consultation, would reduce these impacts, as discussed in the mitigation section of this chapter.

Given the magnitude and location of several of the transportation network improvements occurring between 2036 and 2050, and the number of additional transportation network improvements over those implemented by 2035, additional significant ground disturbances are anticipated. It is therefore likely that more tribal cultural resources would be disturbed between 2036 and 2050.

As discussed in the 2035 analysis, although adherence to the existing laws, regulations, and programs would reduce impacts on tribal cultural resources upon implementation of the proposed Plan, there remains a likelihood that they would reduce these impacts to a less-than-significant level for all future projects under the proposed Plan. Implementation of the proposed Plan would result in ground-disturbing activities and increased access related to transportation network improvements, which may result in significant operational impacts on tribal cultural resources if not mitigated. Given the potential for transportation facilities to cause substantial adverse changes in the significance of tribal cultural resources coupled with the nonrenewable nature of these resources if disturbed or altered, this is a significant impact.

2050 Conclusion

Implementation of the proposed Plan would result in regional growth and land use change and transportation network improvements and programs that could cause a substantial adverse change in the significance of a tribal cultural resource. Therefore, this impact (TCR-1) in the year 2050 is significant.

MITIGATION MEASURES

TCR-1 CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF A TRIBAL CULTURAL RESOURCE, DEFINED IN PUBLIC RESOURCES CODE SECTION 21074 AS EITHER A SITE, FEATURE, PLACE, CULTURAL LANDSCAPE THAT IS GEOGRAPHICALLY DEFINED IN TERMS OF THE SIZE AND SCOPE OF THE LANDSCAPE, SACRED PLACE, OR OBJECT WITH CULTURAL VALUE TO A CALIFORNIA NATIVE AMERICAN TRIBE, AND THAT IS EITHER (1) LISTED OR ELIGIBLE FOR LISTING IN THE CALIFORNIA REGISTER OF HISTORICAL RESOURCES, OR IN A LOCAL REGISTER OF HISTORICAL RESOURCES AS DEFINED IN PUBLIC RESOURCES CODE SECTION 5020.1(K); OR (2) DETERMINED BY THE LEAD AGENCY, IN ITS DISCRETION AND SUPPORTED BY SUBSTANTIAL EVIDENCE, TO BE SIGNIFICANT PURSUANT TO CRITERIA SET FORTH IN SUBDIVISION (C) OF PUBLIC RESOURCES CODE SECTION 5024.1.

2035 2050

TCR-1a: Implement Tribal Cultural Resources Mitigation Measures for Development Projects and Transportation Network Improvements.

During project-level CEQA review of development projects or transportation network improvements that would cause a substantial adverse change in the significance of a tribal cultural resource, the County of San Diego, cities, and other local jurisdictions can and should, SANDAG shall, and other transportation project sponsors, can and should develop project-level protocols and mitigation measures with consulting tribes, consistent with PRC Section 21080.3.2(a) to avoid or reduce impacts on tribal cultural resources during construction and operation of development projects and transportation network improvements. The County of San Diego, cities, and other local jurisdictions can and should, SANDAG shall, and other transportation projects sponsors can and should identify these resources through records searches, survey, consultation, or other means, in order to develop minimization and avoidance methods where possible, and consult with California Native American tribes participating in AB 52 consultation to develop mitigation measures for tribal cultural resources that may experience substantial adverse changes.

To assist AB 52 consultation, the County of San Diego, cities, and other local jurisdictions can and should, SANDAG shall, and other transportation project sponsors can and should comply with the following best practices for complying with AB 52:

- Gather relevant cultural resources information, such as CHRIS records search results, prior archaeological or ethnographic studies, SLF checks, or tribal input, early in the planning process to help identify tribal cultural resources and preserve options for avoidance or preservation in place.
- Build working relationships with tribes that are traditionally and culturally affiliated to the project area or to the agency's geographic area of jurisdiction. In consultation, agencies should deal with officially designated representatives of the tribe who have written designation to speak on behalf of the tribe.
- Avoid inadvertent discoveries of California Native American burials and work with tribes in advance to determine culturally appropriate treatment and disposition if burials are inadvertently discovered.
- Maintain the confidentiality of information shared during consultation, consistent with PRC Section 21082.3(c)(2), unless the tribe provides written consent to disclose. This measure helps prevent looting, vandalism, or damage to tribal cultural resources.
- Implement any mitigation measures agreed upon during AB 52 consultation.

In the absence of any specific mitigation measures agreed upon during AB 52 consultation, the County of San Diego, cities, and other local jurisdictions can and should, SANDAG shall, and other transportation project sponsors can and should develop standard mitigation measures as set forth in PRC Section 21084.3(b).

The following are standard mitigation measures for tribal cultural resources:

1. Avoidance and preservation of the resources in place, consisting of, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
2. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, consisting of, but not limited to, the following:
    a. protecting the cultural character and integrity of the resource
    b. protecting the traditional use of the resource
    c. protecting the confidentiality of the resource
3. Record permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

4. Protecting the resource as agreed upon during the tribal consultation process.

TCR-1b: Implement Monitoring and Mitigation Programs for Development Projects and Transportation Network Improvements.
During project-level CEQA review and during construction of development projects and transportation network improvements, the County of San Diego, cities, and other local jurisdictions can and should, SANDAG shall, and other transportation project sponsors can and should identify and implement monitoring and mitigation measures to reduce impacts on both known and undiscovered tribal cultural resources, during construction and operation activities, as applicable, consisting of but not limited to the following:

- Require tribal cultural resource areas identified in any required monitoring and mitigation plan to be monitored during the grading phase of individual projects by a qualified archaeologist, and tribal monitor who has been approved by the consulting tribe(s).
- Should a previously undiscovered cultural resource be encountered during construction activities that is determined to be a tribal cultural resource by the CEQA lead agency in consultation with California Native American tribes, the qualified archaeologist, or tribal monitor if an archaeologist is not present, shall direct the contractor to temporarily divert all ground-disturbing activities in the area of the discovery and prepare and implement a mitigation plan consistent with, but not necessarily limited to, standard mitigation measures set forth in PRC Section 21084.3(b), in consultation with California Native American tribes.
- The qualified archaeologist shall be responsible for ensuring that all records associated with the survey, testing, data recovery, and monitoring of future projects are curated with an appropriate regional information center, such as the South Coastal Information Center (SCIC) at San Diego State University. The construction contractor(s) and lead agency shall facilitate the respectful reburial of the culturally sensitive soils or objects. This includes providing a reburial location that is consistent with the tribe's preferences, excavation of the reburial location, and assisting with the reburial upon written request by a designated representative of the tribe. This shall be completed in consultation with the California Native American representative and does not include California Native American human remains and associated burial items, the disposition of which should be determined in consultation with the designated Most Likely Descendants (MLDs).
- Upon completion of all ground-disturbing activity, the qualified archaeologist shall prepare and submit a draft and final monitoring report to the CEQA lead agency that describes the results, analysis, and conclusions of all phases of the monitoring program, including the provisions for curation and repatriation, if applicable, and copies of any signed curation agreements to verify completion of the required monitoring program. A copy of the final monitoring report, and appendices thereto, will be provided to designated representatives of consulting tribe(s) upon request.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Implementation of the proposed Plan would result in significant impacts on tribal cultural resources through construction and ground-disturbing activities and unauthorized or unintentional access to sensitive tribal cultural areas in 2035 and 2050. Implementation of mitigation measures TCR-1a and TCR-1b would reduce impacts by incorporating tribal input to avoid or minimize disturbance to tribal cultural resources, ensuring appropriate treatment of discoveries, and implementing mitigation monitoring to detect and address impacts during construction. However, it cannot be guaranteed that all future project-level impacts under the proposed Plan can be mitigated to a less-than-significant level. Therefore, this impact (TCR-1) would remain significant and unavoidable.

4.17.5 Cumulative Impacts Analysis

C-TCR-1 CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF A TRIBAL CULTURAL RESOURCE, DEFINED IN PUBLIC RESOURCES CODE SECTION 21074 AS EITHER A SITE, FEATURE, PLACE, CULTURAL LANDSCAPE THAT IS GEOGRAPHICALLY DEFINED IN TERMS OF THE SIZE AND SCOPE OF THE LANDSCAPE, SACRED PLACE, OR OBJECT WITH CULTURAL VALUE TO A CALIFORNIA NATIVE AMERICAN TRIBE, AND THAT IS EITHER (1) LISTED OR ELIGIBLE FOR LISTING IN THE CALIFORNIA REGISTER OF HISTORICAL RESOURCES, OR IN A LOCAL REGISTER OF HISTORICAL RESOURCES AS DEFINED IN PUBLIC RESOURCES CODE SECTION 5020.1(K); OR (2) DETERMINED BY THE LEAD AGENCY, IN ITS DISCRETION AND SUPPORTED BY SUBSTANTIAL EVIDENCE, TO BE SIGNIFICANT PURSUANT TO CRITERIA SET FORTH IN SUBDIVISION (C) OF PUBLIC RESOURCES CODE SECTION 5024.1.

The area of geographic consideration for cumulative impacts on tribal cultural resources is the Southern California and Northern Baja California region. Because local and regional settlement patterns are closely linked, evaluating the cumulative loss of tribal cultural resources across this entire geographic area is necessary to determine whether such loss would result in a substantial adverse change in the significance of these resources, particularly by diminishing the understanding of the closely interrelated prehistoric and historic context. A significant cumulative impact on tribal cultural resources would occur if the proposed Plan would result in incremental effects that are considered cumulatively significant when considered in combination with the impact projections in adopted plans, and impacts on tribal cultural resources resulting from existing and probable future projects. Significant cumulative impacts related to tribal cultural resources would occur if cumulatively there would be a substantial increase in substantial adverse impacts with regard to the significance of tribal cultural resources.

This cumulative impact assessment considers and relies on the impact analysis within this EIR for the proposed Plan, SCAG's Connect SoCal 2024-2050 Regional Transportation Plan/Sustainable Communities Strategy EIR (SCAG 2024) for the Southern California region, the County of San Diego General Plan Update EIR (County of San Diego 2011), and the California-Baja California 2021 Border Master Plan (Caltrans 2021). Many local jurisdictions provide guidance and protective measures for tribal cultural resources in their general plans and other local planning documents. There are generally no regional plans pertaining to such resources for the Northern Baja California region. The California-Baja California Border Master Plan is a binational comprehensive approach to coordinate planning and delivery of projects at land POEs and transportation infrastructure serving those POEs in the California-Baja California region. The Master Plan does not have an associated environmental analysis document, and no detailed analysis of cultural resource impacts was conducted for this Master Plan (Caltrans 2021).

Impacts of the Proposed Plan

Areas in the San Diego region are known to have a high potential for tribal cultural resources. Implementation of the proposed Plan would result in the construction of development projects and transportation network improvements that would result in a wide range of construction and ground-disturbing activities, such as excavation, grading, and clearing, which remove or disturb the upper layer of soils. Since tribal cultural resources have been found within inches of the ground surface in some areas of the San Diego region, in some locations these ground-disturbing activities would cause a substantial adverse change in the significance of a tribal cultural resource by unearthing or damaging the resource such that its significance would be materially impaired. Implementation of the proposed Plan would necessitate construction activities that in some locations would cause a substantial adverse change in the significance of a tribal cultural resource through the physical demolition, destruction, relocation, or alteration of a resource or its immediate surroundings such that the significance of a tribal cultural resource would be materially impaired. This would occur within each horizon year analyzed (2035 and 2050). Therefore, impacts related to a substantial adverse change in the significance of a tribal cultural resource would be significant (Impact TCR-1).

In addition to direct impacts from construction and ground disturbance, the proposed Plan may also result in indirect impacts on tribal cultural resources through increased public access to previously less accessible areas.

Such access could lead to heightened risks of vandalism, looting, or inadvertent disturbance of sensitive sites, particularly if adequate avoidance and protective measures are not implemented. If not properly managed, these indirect impacts could contribute to a substantial adverse change in the significance of tribal cultural resources.

Impacts of Related Projects

Land development and infrastructure projects throughout the region, such as transportation infrastructure, energy generation and transmission corridors, and commercial and residential land development would likely result in impacts if these projects occur in areas containing tribal cultural resources. For example, projects planned in the Southern California region, such as the Navy Old Town Campus Revitalization Project, San Diego International Airport (SDIA) Airport Development Plan, High-Speed Train (HST), and City of San Diego Pure Water North City, would result in impacts related to destruction or alteration of tribal cultural resources. For example, the HST project in the San Diego region would result in construction of track, bridges and elevated guideways, stations, and other features that may result in destruction or alteration of tribal cultural resources, referred to in the program EIR/EIR as traditional cultural properties (HSRA 2005). The EIR/EIS prepared for the HST project determined that the project would result in significant cumulative impacts on traditional cultural properties. The SDIA Airport Development Plan involved construction activities with the potential to affect tribal cultural resources; however, the EIR for the project (SDCRAA 2020) concluded that such impacts would not be significant under CEQA. The Navy Old Town Campus Revitalization Project EIS did not identify any known tribal cultural resources within the project area. The Native American Heritage Commission indicated that no such resources were present, and the Navy committed to consultation with the SHPO and other interested parties. Mitigation measures, including inadvertent discovery protocols, would reduce impacts to cultural and historic resources to less than significant levels under NEPA (U.S. Department of the Navy 2020, Table ES-1). The City of San Diego Pure Water North City Project EIR/EIS identified impacts to known tribal cultural resources associated with religious or sacred uses or human remains. However, with implementation of mitigation measure MM-HIS-3, as described in Section 6.10, impacts were reduced to a level below significance (City of San Diego 2018, Table ES-1)

Impacts of Projections in Adopted Plans

Implementation of the SCAG 2024-2050 RTP/SCS would result in significant and unavoidable impacts related to adverse changes in the significance of tribal cultural resources. In addition, the SCAG 2024-2050 RTP/SCS's influence on growth would contribute to regionally significant impacts on tribal cultural resources and be cumulatively considerable (SCAG 2024). The EIR prepared for the County of San Diego General Plan Update did not explicitly analyze impacts on tribal cultural resources. ;However, the EIR addresses archaeological resources and includes mitigation measures consistent with SB 18, including coordination with Native American Heritage Commission and local tribal governments (County of San Diego 2011, Section 2.5.6, pp. 2.5-37 to 2.5-40). Because tribal cultural resources were not explicitly addressed, the EIR did not reach a specific significance conclusion for such resources. The California-Baja California Border Master Plan does not provide analysis of impacts on tribal cultural resources; however, projects included in the Master Plan could have adverse impacts on tribal cultural resources due to ground disturbance necessary for construction of infrastructure.

Cumulative Impacts and Impact Conclusions

2035

A significant cumulative impact in the year 2035 would occur if the proposed Plan would result in incremental effects that are considered cumulatively considerable when considered in combination with impacts of cumulative projects and the impact projections in adopted plans within the Southern California and Northern Baja region. As described above, implementation of the proposed Plan, cumulative projects, and other plans would result in ground-disturbing activities that would cause a substantial adverse change in the significance of a tribal cultural resource.

California projects are required to adhere to federal, state, and local regulations, as described in Section 4.17.2, "Regulatory Setting"; however, cumulative growth development located in Mexico would not be subject to compliance with such regulations. Additionally, even with regulations in place, individual tribal cultural resources could still be impacted or degraded from demolition, destruction, alteration, or structural relocation as a result of

new private or public development or redevelopment allowable under the proposed Plan, cumulative projects, or other adopted plans. Therefore, cumulative impacts on tribal cultural resources would be significant. Because the proposed Plan's impacts on tribal cultural resources are significant, the project's contribution to the significant cumulative impact is cumulatively considerable in 2035 (Impact C-TCR-1).

2050

The cumulative analysis presented above for the horizon year of 2035 would be applicable to year 2050, and significant cumulative impacts on tribal cultural resources would occur. By 2050, increases in regional growth and land use change, and the number of transportation network improvements implemented over those that occurred by 2035 would result in adverse impacts related to changes in the significance of a tribal cultural resource. As described in the 2035 analysis, cumulative impacts on tribal cultural resources would be significant because there would be cumulative adverse changes in the significance of those resources due to the proposed Plan, cumulative projects, and other plans, and development located in Northern Baja California. Because the proposed Plan's impacts on tribal cultural resources are significant, the project's contribution to the significant cumulative impact is cumulatively considerable in 2050 (Impact C-TCR-1).

MITIGATION MEASURES

C-TCR-1 CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF A TRIBAL CULTURAL RESOURCE, DEFINED IN PUBLIC RESOURCES CODE SECTION 21074 AS EITHER A SITE, FEATURE, PLACE, CULTURAL LANDSCAPE THAT IS GEOGRAPHICALLY DEFINED IN TERMS OF THE SIZE AND SCOPE OF THE LANDSCAPE, SACRED PLACE, OR OBJECT WITH CULTURAL VALUE TO A CALIFORNIA NATIVE AMERICAN TRIBE, AND THAT IS EITHER (1) LISTED OR ELIGIBLE FOR LISTING IN THE CALIFORNIA REGISTER OF HISTORICAL RESOURCES, OR IN A LOCAL REGISTER OF HISTORICAL RESOURCES AS DEFINED IN PUBLIC RESOURCES CODE SECTION 5020.1(K); OR (2) DETERMINED BY THE LEAD AGENCY, IN ITS DISCRETION AND SUPPORTED BY SUBSTANTIAL EVIDENCE, TO BE SIGNIFICANT PURSUANT TO CRITERIA SET FORTH IN SUBDIVISION (C) OF PUBLIC RESOURCES CODE SECTION 5024.1.

2035, 2050

Mitigation measures to reduce impacts on tribal cultural resources due to implementation of the proposed Plan as identified in Section 4.17.4, "Environmental Impacts and Mitigation Measures," would be applicable to reducing the proposed Plan's cumulative impacts as well. Mitigation Measures TCR-1a and TCR-1b are measures to avoid or substantially reduce adverse changes in the significance of a tribal cultural resource and protect tribal cultural resources. These mitigation measures also require the implementation of monitoring and data recovery programs during construction. These mitigation measures would be included in project-level planning, design, and CEQA reviews. The measures would be required as part of projects under the proposed Plan for which SANDAG is the lead agency, and would be recommendations when other local jurisdictions act as lead agency. Implementation of these mitigation measures would not reduce impacts that would cause a substantial adverse change in the significance of a tribal cultural resource to less than significant because it cannot be guaranteed that all future project-level impacts under the proposed Plan can be mitigated to a less-than-significant level. Mitigation Measures TCR-1a and TCR-1b would not reduce the proposed Plan's incremental impacts to less than significant. Therefore, the proposed Plan's incremental contributions to cumulative tribal cultural resources impacts in years 2035 and 2050 would remain cumulatively considerable post-mitigation.

4.18 WATER SUPPLY

This section evaluates the water supply impacts of the proposed Plan.

4.18.1 Existing Conditions

This section describes the general water supply conditions of both potable water and groundwater supply in the San Diego region, including local water supplies, imported water supply, desalination, and water recycling efforts. The existing conditions discussion provided below is primarily summarized from the urban water management plans (UWMPs) prepared by the applicable water supply agencies including the San Diego County Water Authority (SDCWA) and the Metropolitan Water District of Southern California (MWD) (SDCWA 2021a; MWD 2021). UWMPs have a 25-year planning horizon. The existing water supply conditions are based on the most recent available data for the San Diego region. Hydrological conditions and surface and groundwater water quality are addressed in Section 4.10, "Hydrology and Water Quality."

METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

The following information about MWD is summarized from the MWD 2020 UWMP, dated June 2021 (MWD 2021), unless noted otherwise. MWD is a public agency that was formed in 1928 for the purpose of developing, storing, and distributing water to the residents of Southern California. MWD's mission is to provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way. The total area served by MWD is approximately 5,200 square miles, and it includes portions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. MWD imports water from two sources: (1) Colorado River water via the Colorado River Aqueduct and (2) the State Water Project (SWP) via the California Aqueduct from the San Francisco Bay/Sacramento–San Joaquin Delta area (Bay/Delta) in Northern California. The Colorado River Aqueduct is more than 240 miles long, beginning at Lake Havasu on the Arizona-California border and ending at Lake Mathews in Riverside County. The aqueduct has the capacity to deliver up to 1.25 million acre-feet (af) of water per year. The SWP is owned by the State of California and operated by the Department of Water Resources (DWR). The SWP stretches from Lake Oroville in the north to Lake Perris in the south and comprises 32 storage facilities, 662 miles of aqueduct, and 25 power and pumping plants. Water is stored at Lake Oroville and released when needed into the Feather River, which flows into the Sacramento River and to the Delta. The Delta is the largest estuary on the United States' west coast and is used for multiple purposes, including agriculture, recreation, and fishing, and provides the means by which to deliver water from Northern California to the south. Water from the Delta is either pumped to water users in the San Francisco Bay area or transported through the California Aqueduct to water users in Central and Southern California. SWP facilities provide drinking water to 27 million Californians and irrigation water for 750,000 acres of farmland (SDCWA 2021a).

MWD serves approximately 19 million residents and is composed of 26 voluntary member agencies, including 14 cities, 11 municipal water districts, and one county water authority, the SDCWA. MWD member agencies serve residents in 152 cities and 89 unincorporated communities. Average daily delivery (5-year average as of December 31, 2023) is 4,100 af (MWD 2024). An acre-foot is approximately 325,900 U.S. gallons, or roughly enough to supply 2.5 average families of four for a year (SDCWA 2020). MWD is a water wholesaler with no retail customers. To aid in planning future water needs, member agencies advise MWD of how much water they anticipate needing during the next 5 years. In addition, MWD works with its member agencies to forecast future water demand and develop emergency supply strategies to ensure a secure, long-term water supply.

SAN DIEGO COUNTY WATER AUTHORITY

The following information is summarized from the SDCWA 2020 UWMP, dated May 2021 (SDCWA 2021a), unless noted otherwise. SDCWA was formed in 1944. Because of a strong military presence in the region, the federal government arranged for supplemental supplies from the Colorado River in the 1940s. In 1947, water began to be

imported from the Colorado River via a single pipeline that connected to the MWD Colorado River Aqueduct in Riverside County. To meet the water demands of a growing population and economy, SDCWA constructed four additional pipelines between the 1950s and early 1980s that are all connected to the MWD distribution system and deliver water to San Diego County. SDCWA's mission is to provide a safe and reliable supply of water to its member agencies serving the San Diego region. SDCWA has 22 member agencies: six cities, five water districts, three irrigation districts, seven municipal water districts and one federal military agency. SDCWA member agencies include Carlsbad, Helix, Lakeside, Olivenhain, Otay, Padre Dam, Ramona, Rincon del Diablo, San Dieguito, Santa Fe, South Bay, Vallecitos, Valley Center, Vista, and Yuima water districts; Camp Pendleton Marine Corps Base; and the cities of Del Mar, Escondido, National City, Oceanside, Poway, and San Diego. Although the cities of Coronado and Imperial Beach are not within the SDCWA service area, they obtain their water from the City of San Diego, and their water consumption is included in regional water use (SDCWA 2021a). The supply of these two cities originates primarily from water imported by SDCWA and provided to the City of San Diego, and secondarily from water captured in City of San Diego reservoirs.

SDCWA classifies water demand within its service area into two categories: municipal and industrial (M&I), and agricultural. The M&I demand classification includes residential demand and water used for commercial, industrial, and institutional purposes. M&I use amounts to 92% of water demand (SDCWA 2021a). SDCWA utilizes an econometric model to develop its long-range M&I demand forecasts, which is based on the U.S. Army Corps of Engineers Municipal and Industrial Needs model and the SANDAG official growth forecasts. Agricultural demand projections are based on coordination between SDCWA, its member agencies, SANDAG, County of San Diego Agricultural Weights and Measures, and the California Avocado Commission.

As an urban water supplier, SDCWA is required to submit a complete version of its UWMP to DWR every 5 years. SDCWA prepared the most recent UWMP, the 2020 UWMP, in accordance with the Urban Water Management Planning Act (UWMPA). In addition to the 2020 UWMP, SDCWA also prepares annual water supply reports that provide updated information on the development of local and imported water supplies. The 2024 Water Facilities Master Plan (2024 Master Plan) serves as a comprehensive evaluation of infrastructure requirements needed to ensure water supply for the SDCWA service area (SDCWA 2025a). The capital improvement projects included in the Master Plan are designed to meet the projected water supply and delivery needs of the member agencies through 2035. These supporting documents provide the most relevant source of baseline information for understanding existing SDCWA water supply conditions. Table 4.18-1 shows annual regional water use (excluding recycled water) in the SDCWA service area from 2014 through 2023. Total potable water use for 2023 decreased approximately 10% compared to the prior year.

Table 4.18-1 SDCWA Service Area Regional Water Use Trends (acre-feet)

Year	Total Potable Water Use	Potable M&I Water Use
2014	574,343	526,218
2015	512,344	471,144
2016	432,145	440,455
2017	453,345	422,475
2018	491,280	455,708
2019	440,681	415,984
2020	440,346	416,975
2021	475,619	446,814
2022	467,310	442,794
2023	420,118	402,804

Notes: SDCWA = San Diego County Water Authority; M&I = municipal and industrial.

[1] Data reflects a snapshot in time and is subject to changes.

[2] Total potable water use excludes reclaimed water.

SDCWA Water Supply Sources

SDCWA supplies imported water to the San Diego region for wholesale distribution to its member agencies and is now the predominant water provider in the county, supplying 75–95% of the San Diego region's water. Historically, SDCWA has relied predominantly on imported water supplies purchased from MWD to meet the needs of its member agencies. SDCWA is MWD's largest member agency, purchasing up to 30% of MWD's supplies annually. Overall, imported water supplies consist of water purchases from MWD, core water transfers from the Imperial Irrigation District (IID), the All-American Canal and Coachella Canal Lining Projects, and as-needed spot water transfers to offset reduced supplies (shortages) from MWD. These imported water supplies are delivered to SDCWA member agencies through a system of large-diameter pipelines, pumping stations, and reservoirs. In addition to imported water supplies, SDCWA began delivering regional water supplies consisting of desalinated seawater from the Carlsbad Desalination Plant in December 2015. Each of the primary sources of the SDCWA water supply is detailed further below.

Metropolitan Water District of Southern California Purchases

As noted, SDCWA has relied predominantly on imported water supplies purchased from MWD. MWD legally entitles each member agency to a preferential right to purchase a certain percentage of MWD's supplies. The percentage is based on the member's past payments toward MWD's capital and operating costs, excluding payments for water purchases. Preferential rights are updated annually. As of June 30, 2020, SDCWA has preferential right to 25.83% of MWD's water supplies (SDCWA 2021a). In fiscal year 2023, SDCWA purchased about 7.3% of the water MWD sold (SDCWA 2024b).

SDCWA-IID Water Conservation and Transfer Agreement

On April 29, 1998, SDCWA entered into a water conservation and transfer agreement with IID for the long-term transfer of conserved Colorado River water to the San Diego region. The Water Authority–IID Water Conservation and Transfer Agreement (Transfer Agreement) is the largest agriculture-to-urban water transfer in U.S. history. Colorado River water is conserved by Imperial Valley farmers who voluntarily participate in the program by fallowing (leaving land unseeded) and implementing on-farm conservation projects that conserve water, which is then transferred to SDCWA for use in the San Diego region. In addition, the IID is developing distribution system efficiency improvements to conserve water, which are planned to increase over time as the transfer volume also increases. In October 2003, SDCWA and IID executed an amendment to the original 1998 Transfer Agreement, which modified, among other things, certain aspects of the agreement to lessen the environmental impacts of transferring conserved water. Water deliveries via the transfer began in 2003 with an initial transfer of 10,000 af. In 2019, SDCWA received 192,500 af. The quantities were scheduled to be 205,000 af in 2021 and 202,500 af in 2022; the quantities would then remain fixed at 200,000 af for the duration of the Transfer Agreement. The initial term of the Transfer Agreement is 45 years, with a provision that allows either agency to extend it for an additional 30 years. Table 4.18-2 summarizes the existing and projected water supplies based on the current Transfer Agreement (SDCWA 2021a).

Table 4.18-2 Existing and Projected SDCWA-IID Transfer Supplies – Normal Year (acre-feet/year)

2020	2025	2030	2035	2040	2045
192,500	200,000	200,000	200,000	200,000	200,000

Note: SDCWA-IID = San Diego County Water Authority–Imperial Irrigation District.

Source: SDCWA 2021a: Table 4-1.

All-American and Coachella Canals Projects

SDCWA also has a separate, 110-year agreement to receive water conserved by lining parts of the Coachella and All-American Canals in Imperial Valley. As part of the Quantification Settlement Agreement and related contracts, SDCWA receives the rights to 77,700 acre-feet per year (afy) of conserved water from these two canal lining projects. SDCWA helped fund the construction of a 35-mile lining project along the Coachella Canal and a 23-mile lining project along the All-American Canal. The concrete-lined sections replaced earthen sections and conserve water previously lost to seepage (SDCWA 2021a). The Coachella Canal Lining Project involved construction of the concrete-

lined canal parallel and adjacent to the existing earthen Coachella Canal. Construction of the Coachella Canal Lining Project was completed in 2006, and deliveries of conserved water to SDCWA began in 2007. The All-American Canal Lining Project, involving construction of a 23-mile concrete-lined canal parallel to the existing earthen All-American Canal, was completed in 2010 when the deliveries of conserved water to SDCWA began (SDCWA 2021a).

The All-American Canal Lining Project makes 67,700 af of Colorado River water per year available for allocation to SDCWA and San Luis Rey Indian water rights settlement parties. The Coachella Canal Lining Project makes 26,000 af of Colorado River water available each year for allocation. The 2003 Allocation Agreement provides for 16,000 afy of conserved canal lining water to be allocated to the San Luis Rey Indian water rights settlement parties. The remaining amount (i.e.,77,700 afy) is to be available to SDCWA each year. SDCWA will also receive any remaining portion of an available 4,850 afy that is not needed for designated environmental purposes associated with the Coachella Canal Lining Project. Under the existing agreements, annual canal lining supplies are delivered in equal monthly installments (SDCWA 2021a).

These two canal lining projects help SDCWA achieve its goals of water supply diversification and improved water supply reliability. Over the 110-year term of the agreement, 8.5 million af of conserved water are anticipated to flow to the San Diego region. Table 4.18-3 summarizes the projected supply from the two lining projects from 2020 to 2045.

Table 4.18-3 Projected Supply from Canal Lining Projects – Normal Year (acre-feet/year)

	2020	2025	2030	2035	2040	2045
Coachella Canal Lining Project	21,500	22,500	22,500	22,500	22,500	22,500
All-American Canal Lining Project	56,200	56,200	56,200	56,200	56,200	56,200
Total	**77,700**	**78,700**	**78,700**	**78,700**	**78,700**	**78,700**

Source: SDCWA 2021a: Table 4-2.

Carlsbad Desalination Plant

Desalinated seawater is a new source of water supply in the San Diego region. Development of seawater desalination in the San Diego region creates a reliable source of water by diversifying the region's water resources, which in turn reduces the region's dependence on imported water supplies. In addition, desalinated seawater is a drought-proof, locally treated water supply. In 2012, SDCWA entered into a formal water purchase agreement with Poseidon Water for the purchase of desalinated ocean water produced at the Claude "Bud" Lewis Carlsbad Desalination Plant (Carlsbad Desalination Plant) and delivered to the SDCWA regional aqueduct system. The Carlsbad Desalination Plant, located at the Encina Power Station in Carlsbad, became operational in December 2015 and provides an average of 50 million gallons per day (mgd) and up to 56,000 afy of high-quality drinking water for the region. Of this total, 6,000 af is considered water supply directly for SDCWA member agencies (SDCWA 2021a). A 10-mile-long pipeline delivers water from the plant to the SDCWA Second Aqueduct. The Second Aqueduct conveys desalinated water to the SDCWA Twin Oaks Valley Water Treatment Plant (WTP), where it is integrated with existing drinking water supplies for regional distribution. Table 4.18-4 details the projected water supply deliveries to SDCWA from the Carlsbad Desalination Plant.

Table 4.18-4 Projected Supply from Carlsbad Desalination Plant – Normal Year (acre-feet/year)

2025	2030	2035	2040	2045
50,000	50,000	50,000	50,000	50,000

Source: SDCWA 2021a: Table 4-4.

Dry Year Water Supplies and Carryover Storage

In addition to normal year water supplies, SDCWA has a carryover storage supply program to maintain water supply reliability during dry and multiple dry years. This program includes both in-region surface water storage at San Vicente Reservoir, secured as part of the San Vicente Dam project, and out-of-region groundwater storage in California's Central Valley. Because of these storage capabilities, SDCWA can store water during wet periods for use during water supply shortages.

The San Vicente Dam Raise Carryover Storage project, located in the San Vicente Reservoir, was completed in 2014 and provides approximately 100,000 af of local storage capacity that can be made available during water supply shortages. In addition, SDCWA's out-of-region groundwater program consists of 70,000 af of permanent groundwater storage allocation in the Semitropic-Rosamond Water Bank Authority and the Semitropic Water Bank (40,000 af and 30,000 af, respectively) in Kern County (SDCWA 2021a).

In accordance with the SDCWA Water Shortage Contingency Plan (WSCP), which guides SDCWA's water supply shortage management, use of carryover storage supplies can occur in level 1 (voluntary cutbacks) and levels 2–6 (mandatory cutbacks) (SDCWA 2021b). The WSCP is discussed below.

SDCWA Member Agency Supplies

Local resources developed and managed by the 22 SDCWA member agencies are critical to securing a diverse and reliable water supply for the region. Water projects implemented at the local level help reduce the demand for imported water and ensure a drought-resilient supply for member agencies. Member agency water supplies consist predominantly of surface water stored in reservoirs, whereas a small but increasing amount comes from recycled water, groundwater recovery projects, potable reuse, and desalinated seawater. A description of each of these supplies follows.

Surface Water Supply

Surface water refers to water accumulated in local streams, rivers, and lakes from precipitation in various watersheds throughout the San Diego region. Collection and storage of local water supplies are supported by the 24 surface reservoirs located in seven of the nine coastal watersheds in the San Diego region (see Figure 4.18-1). The surface reservoirs have a combined capacity of 722,793 af (SDCWA 2021a). The water is placed into storage in the winter months when demand is low and pipeline capacity is available and withdrawn by the member agencies in the summer months when demand increases and pipeline capacity is restricted due to increased demand.

Surface water supplies can represent the largest single local resource for SDCWA member agencies. However, annual surface water yields can vary substantially due to fluctuating hydrologic cycles. Annual surface water yields have ranged from a low of 4,100 af in fiscal year 2015 to a high of 140,300 af in fiscal year 1984. SDCWA member agencies project average annual surface water use to increase slightly, from 43,957 af in 2025 to 44,659 af in 2045 (SDCWA 2021a). Table 4.18-5 shows the estimated average surface water supply of SDCWA member agencies from 2020 to 2045.

Table 4.18-5 SDCWA Member Agency Projected Surface Water Supply – Normal Year

Year	Water Supply (acre-feet/year)
2020	44,237
2025	43,957
2030	43,957
2035	44,659
2040	44,659
2045	44,659

Note: SDCWA = San Diego County Water Authority.

Source: SDCWA 2021a: Table 5-2.

Water Conservation

Conservation is an important resource strategy for ensuring a cost-effective reliable supply of water for the San Diego region. For the 2020 SDCWA UWMP, future water conservation savings were developed for each member agency using the Alliance for Water Efficiency Water Conservation Tracking Tool, which was included in the DWR 2020 UWMP Guidebook (DWR 2021), as an application to assist water purveyors in developing savings estimates (SDCWA 2021a). Future active conservation savings are set at the 2020 level of conservation program activity moving forward, absent the recent large-scale turf replacement program and state-mandated water-use reduction (SDCWA 2021a).

Figure 4.18-1 Regional Water Supply Infrastructure

Potable Reuse Water Supply

Recycled water can be further treated for potable reuse through the use of multibarrier advanced purification treatment processes, which may include technologies such as reverse osmosis and advanced oxidation. The advanced-treated water may be passed through a natural barrier, such as a groundwater basin or surface water reservoir, and provided with additional treatment to render wastewater suitable for potable purposes. Projects that include a natural barrier are considered indirect potable reuse. Projects that deliver advanced treated water directly to a raw or treated water pipeline are considered direct potable reuse. SDCWA worked closely with its member agencies to determine the projected yield from existing and planned potable water reuse projects. Table 4.18-6 shows the estimated verifiable annual yield from the projects in 5-year increments based on the implementation schedules provided by the member agencies and the likelihood of development.

Table 4.18-6 Projected Potable Reuse Water Use – Normal Year (acre-feet/year)

2025	2030	2035	2040	2045
33,042	53,202	112,562	112,562	112,562

Source: SDCWA 2021a: Table 5-8.

Several SDCWA member agencies are completing studies pertaining to potable reuse in the San Diego region through groundwater recharge or reservoir augmentation. Two agencies, the City of San Diego and the Padre Dam Municipal Water District, have implemented pilot projects to determine potable reuse project viability. The City is currently developing the Pure Water Program, which is a phased, multiyear program that would provide nearly half of San Diego's water supply (approximately 83 million gallons of purified water per day) locally by the end of 2035 (City of San Diego 2025, n.d.). Phase 1 of the Pure Water Program is currently under construction. The Pure Water Program will use proven water purification technology to produce safe, high-quality drinking water from treated recycled water.

Recycled Water Supply

Recycled water has been a growing water resource in San Diego County for decades, providing a local, drought-resilient supply that reduces the region's dependence on imported water. Every gallon of recycled water used within the region reduces the need to import or develop other water supplies. Sixteen of the member agencies have developed recycled water supplies for their retail customers. Member agencies are continuing to expand their recycled water treatment and distribution systems, and it is predicted that member agencies will produce approximately 45,900 afy recycled water by 2045 (SDCWA 2021a). Table 4.18-7 shows the estimated annual yield from the projects in 5-year increments (from 2020 to 2045) based on the implementation schedules provided by the member agencies and the likelihood of development.

Table 4.18-7 Projected Recycled Water Use – Normal Year (acre-feet/year)

2020	2025	2030	2035	2040	2045
35,753	41,963	45,513	45,628	45,749	45,854

Source: SDCWA 2021a: Table 5-7.

The increase in projected recycled water use in 2020 and beyond is primarily from the expansion of existing water recycling facilities throughout the San Diego region. Recycled water development helps relieve pressure on the region's potable water supplies by providing a drought-proof, locally controlled water supply source.

The California Department of Transportation (Caltrans) is one of the largest users of recycled water in the San Diego region. Caltrans set a goal of 50% reduction of potable water consumption by using recycled water and reducing water use to meet the water conservation requirements of an Executive Order issued by Governor Brown in 2015. Caltrans explored alternative means of connecting to and serving recycled water to existing landscaped freeways throughout San Diego County. Parallel encroachment restrictions have prevented many segments of Caltrans freeways from accessing recycled water. Caltrans has eased these restrictions by allowing recycled water purveyors longitudinal encroachment within their right-of-way. Caltrans uses recycled water from the City of San

Diego's North City Water Reclamation Plant along Interstate 5 (I-5) north to Sorrento Valley; along State Route (SR) 52; and along SR 56, I-805, and SR 163 between Black Mountain Road (except for a gap on the north side between Del Sur and Carmel Mountain Road overpass) and Friars Road. Caltrans anticipates the extension of recycled water use east along I-8 between SR 163 and I-15 (City of San Diego 2020).

Groundwater Supplies

The San Diego region overlies three general categories of aquifers: alluvial and sedimentary aquifers, fractured-rock aquifers, and desert basin aquifers (County of San Diego 2010a). The distribution and hydrology of groundwater basins in San Diego County is discussed in detail in Section 4.10, "Hydrology and Water Quality."

SDCWA does not currently hold groundwater basin rights, nor does it own or operate groundwater facilities in the San Diego region. However, groundwater provides an additional source of water supplies for SDCWA member agencies. Although opportunities are limited, groundwater is currently used to meet a portion of the municipal water demands throughout the SDCWA service area from Marine Corps Base Camp Pendleton in the north to National City in the south. There are several factors that limit the amount of groundwater production in the SDCWA service area, including the limited distribution of sand and gravel (alluvial) aquifers and their relatively shallow nature, lack of rainfall and associated groundwater recharge, and degraded water quality from human activities. Shallow and narrow river valleys filled with alluvial sand and gravel deposits are characteristic of the more productive groundwater basins in the San Diego region. Outside of these more productive aquifers, groundwater is developed from fractured crystalline bedrock and semi-consolidated sedimentary deposits that occur throughout the region. However, these aquifers have limited yield and storage and are best suited for meeting domestic water needs that do not require higher flow rates (SDCWA 2021a).

From 2015 to 2020 (the timeframe between UWMP updates), water supply agencies in the SDCWA service area produced an annual average of approximately 22,300 afy of potable water supplies from groundwater (SDCWA 2021a). This total includes production from both brackish groundwater desalination facilities and municipal groundwater wells. However, it does not include groundwater production from privately owned water wells used for irrigation and domestic purposes or groundwater produced annually from the Warner Basin by the Vista Irrigation District. Rather, this groundwater is discharged into Lake Henshaw and reported as local surface water supply by the City of Escondido and Vista Irrigation District.

In addition to providing a local supply to water agencies, groundwater is also both a primary and a supplemental source of water supply for numerous private well owners, who draw on groundwater to help meet their domestic and agricultural water needs. These domestic supplies help offset demand for imported water from SDCWA and its member agencies. However, it is difficult to accurately quantify and estimate the amount of groundwater pumped by private wells within the entire SDCWA service area (SDCWA 2021a).

While groundwater is less abundant in the San Diego region compared to other parts of the state, several water supply agencies in the SDCWA service area have identified potential projects that may provide several thousand acre-feet of additional future groundwater production. SDCWA works closely with its member agencies to develop groundwater yield projections. To be conservative, projections account for existing (verifiable) groundwater projects, which include any planned expansions to existing projects. Table 4.18-8 shows the projected annual groundwater yield from verifiable groundwater projects in 5-year increments from 2020 to 2045.

Table 4.18-8 Projected Groundwater Supply – Normal Year (acre-feet/year)

2020	2025	2030	2035	2040	2045
25,950	30,300	31,500	31,500	28,800	28,000

Source: SDCWA 2021a: Table 5-3.

As discussed below, the Sustainable Groundwater Management Act (SGMA) requires basins to be sustainably managed by local public agencies (e.g., counties, cities, and water agencies) that become groundwater sustainability agencies (GSAs). The main goals of the SGMA are to (1) achieve sustainable groundwater basins, (2) enhance local management of the groundwater, and (3) establish standards for effective and continuous

management of groundwater. The primary purpose of the GSAs is to develop and implement groundwater sustainability plans (GSPs) to achieve long-term groundwater sustainability.

In the San Diego region, the state has designated three of the region's basins as medium or high priority and subject to SGMA, requiring preparation of a GSP: Borrego Valley (Borrego Springs Subbasin), San Luis Rey Valley (Upper San Luis Rey Valley Subbasin), and San Pasqual Valley (County of San Diego n.d.-a). The San Luis Rey Valley Basin extends from the confluence of the San Luis Rey River and Paradise Creek, continuing downstream through four valleys (Pauma, Pala, Bonsall, and Mission) and ending at the Pacific Ocean in the City of Oceanside. Only Pala and Pauma Valleys, known as Upper San Luis Rey Valley Groundwater Subbasin, are subject to the requirements of SGMA (County of San Diego n.d.-b). The San Pasqual Valley Basin underlies San Pasqual Valley and Cloverdale, Rockwood, and Bandy Canyons in central San Diego County. Santa Ysabel, Guejito, and Santa Maria Creeks drain the valley and converge to form the San Dieguito River, which flows into Lake Hodges (County of San Diego n.d.-c). The Borrego Springs Groundwater Subbasin of the Borrego Valley Groundwater Basin was designated as high priority by the state due to a "critical overdraft" condition (BVGSA 2019) and is discussed in additional detail below under "Water Supplies Outside of the SDCWA Service Area."

The Pauma Valley GSA (composed of Pauma Municipal Water District, Pauma Valley Community Services District, San Luis Rey Municipal Water District, Yuima Municipal Water District, and Upper San Luis Rey Resource Conservation District) developed the Upper San Luis Rey GSP, which was approved by DWR in 2024 (DWR 2024). The San Pasqual Valley GSA (composed of City of San Diego and County of San Diego) prepared a San Pasqual Valley Groundwater Basin GSP, which was approved by DWR in 2023 (DWR 2023a).

SDCWA Water Supply Infrastructure and Delivery System

There are 24 surface reservoirs within the SDCWA service area, located in seven of the nine coastal watersheds in the San Diego region. Runoff in these watersheds occurs at the crest of the region's Peninsular Range and drains into the Pacific Ocean. Table 4.18-9 lists the 24 reservoirs, their operating agency, and their storage capacity. Olivenhain Reservoir, completed in 2003, is the region's newest reservoir. It is part of the SDCWA Emergency Storage Project (ESP) and has a storage capacity of 24,774 af. The ESP adds 90,100 af of storage capacity and is designed to protect the region from disruptions in the water delivery system (SDCWA 2021a).

In addition, the 2002 Regional Water Facilities Master Plan identified an opportunity to augment the ESP with a carryover storage component (CSP) at San Vicente. SDCWA completed the ESP and CSP portion of the San Vicente Dam Raise in mid-2014, which provides an additional 157,100 af of water storage capacity (SDCWA 2021a).

Table 4.18-9 Reservoirs in the San Diego Region

Agency (Owner)	Reservoir	Capacity (acre-feet)
Carlsbad Municipal Water District	Maerkle	600
City of Escondido	Dixon	2,606
City of Escondido	Wohlford[1]	2,783
Fallbrook Public Utility District[2]	Red Mountain	1,335
Helix Water District	Cuyamaca	8,195
Helix Water District	Jennings	9,790
City of Poway	Poway	3,432
Rainbow Municipal Water District[2]	Morro Hill	465
Rainbow Municipal Water District[2]	Ramona	12,000
City of San Diego	Barrett	34,806
City of San Diego	El Capitan	112,807
City of San Diego	Hodges[3]	13,401
City of San Diego	Lower Otay	47,067
City of San Diego	Miramar	6,682

Agency (Owner)	Reservoir	Capacity (acre-feet)
City of San Diego	Morena	50,694
City of San Diego	Murray	4,684
City of San Diego	San Vicente[4]	249,358
City of San Diego	Sutherland	29,508
San Dieguito Water District/Santa Fe Irrigation District	San Dieguito	883
San Diego County Water Authority	Olivenhain	24,774
Sweetwater Authority	Loveland	25,400
Sweetwater Authority	Sweetwater	28,079
Valley Center Municipal Water District	Turner	1,612
Vista Irrigation District	Henshaw	51,832
	Total Capacity	**722,793**

[1] The capacity volume accounts for the lowered reservoir level at Lake Wohlford due to DWR Division of Safety of Dams safety issues.

[2] Since approval of the 2020 UWMP, Fallbrook Public Utility District and Rainbow Municipal Water District have detached from SDCWA and annexed into Eastern Municipal Water District.

[3] The capacity volume accounts for lowered reservoir level at Lake Hodges due to DWR Division of Safety of Dams safety issues and is in accordance with the 1998 Emergency Storage Project Agreement for the Joint Use of Lake Hodges Dam and Reservoir.

[4] SDCWA has storage rights to 157,100 af of capacity in San Vicente Reservoir (105,000 af is designated as carryover storage; 52,100 af is designated as emergency storage).

Source: SDCWA 2021a: Table 5-1.

SDCWA Water Treatment Facilities

SDCWA receives both treated and untreated water from MWD. Treated water provided by MWD is filtered at the Robert A. Skinner Treatment Plant in Hemet (Riverside County) and transported to the San Diego region for use via the First and Second San Diego Aqueducts operated by SDCWA. Untreated water received by SDCWA is treated prior to use by the public at one of the 12 water treatment facilities owned and operated by SDCWA or one of its member agencies. SDCWA owns the 100 mgd Twin Oaks Valley WTP and has agreements with the Helix Water District securing 36 mgd of treatment capacity from the R.M. Levy WTP (SDCWA 2021a). Water from the Levy WTP supplements treated water service to the eastern portion of the San Diego region. The balance of treated water supplies comes from WTPs owned and operated by member agencies. These water treatment facilities are listed in Table 4.18-10.

Table 4.18-10 Water Treatment Facilities in the SDCWA Service Area

Water Treatment Plant (WTP)	Operator	Capacity (million gallons per day)
Escondido/Vista WTP	City of Escondido/Vista Irrigation District	75
R.M. Levy WTP	Helix Water District	106
David C. McCollom WTP	Olivenhain Municipal Water District	34
Robert A. Weese Filtration Plant	City of Oceanside	25
Lester J. Berglund WTP	City of Poway	24
Alvarado WTP	City of San Diego	150
Miramar WTP	City of San Diego	140
Otay WTP	City of San Diego	34
Twin Oaks Valley WTP	SDCWA	100
R.E. Badger Filtration Plants	San Dieguito Water District/Santa Fe Irrigation District	40
Robert A. Perdue WTP	Sweetwater Authority	30

Note: SDCWA = San Diego Water Authority.

Source: SDCWA 2021a: Table 1-3.

WATER SUPPLIES OUTSIDE THE SDCWA SERVICE AREA

The SDCWA service area encompasses the western third of San Diego County while the proposed Plan area is coterminous with the County. The rural, eastern portion of the San Diego region is outside the SDCWA service area and completely dependent on local groundwater for water supply. Geographically, the majority of the unincorporated area (65%) located roughly within and east of the Palomar and Cuyamaca mountains is reliant upon either separate groundwater-dependent districts or private wells that are unaffiliated with SDCWA. Groundwater is derived from onsite private wells, small community water systems, or private water companies. According to GIS overlay analysis of SANDAG's Master Geographic Reference Area 15 (MGRA 15) and SDCWA service area boundaries, as of 2022, there were approximately 111,770 residents outside of the SDCWA service area (SANDAG 2025; County of San Diego 2024). Regardless of the responsible provider, all of these areas are entirely reliant on groundwater and, as such, the water supply in these areas is subject to groundwater availability. Table 4.18-11 provides a list of water supply providers outside the SDCWA service area.

Several of these districts are not required to prepare UWMPs because they either do not serve more than 3,000 customers or do not distribute more than 3,000 af of water annually (County of San Diego 2011).

The County of San Diego conducted a groundwater study as part of the 2011 General Plan Update (County of San Diego 2010a). The study area encompassed approximately 1,885 square miles of land, which is entirely groundwater dependent. The study area is bounded by Riverside County to the north, the international boundary with Mexico to the south, San Diego County unincorporated and incorporated land served by the SDCWA member agencies to the west, and desert basin aquifers and Imperial County to the east. It consists of nine hydrologic units within the San Diego Hydrologic Region and three hydrologic units within the Colorado Hydrologic Region.

The study identified the following areas as having the potential for localized groundwater problems (especially at the height of extended drought periods) from pumping large amounts of groundwater: (1) Ballena Valley, located east of Ramona; (2) Guatay, located in the Cuyamaca Mountains; (3) Julian Town Center; and (4) Morena Village, located northwest of Campo. Thirteen basins were identified as having a potentially significant impact on groundwater resources at maximum build-out of the 2011 General Plan Update. The study also determined that the Borrego Springs Park Community Services District and Borrego Water District would have inadequate water supply to serve their service area (County of San Diego 2010a).

Table 4.18-11 Water Supply Agencies Outside the SDCWA Service Area

Water Supply Provider	Community Served	Source
Borrego Water District	Anza Borrego and Borrego Springs	Local groundwater supply and sole source aquifer[1]
Borrego Springs Park Community Service District*	Borrego Springs	Local groundwater supply
Campo Water Maintenance District*	Campo	Local groundwater supply
Canebrake County Water District	Anza Borrego, seasonal visitors and part-time residents	Local groundwater supply
Cuyamaca Water District*	Cuyamaca	Local groundwater supply
Descanso Community Service District*	Descanso	Local groundwater supply
Jacumba Community Services District*	Jacumba	Local groundwater supply
Julian Community Service District *	Julian	Local groundwater supply
Live Oak Springs Water Company	Boulevard	Local groundwater supply
Majestic Pines Community Service District*	Julian	Local groundwater supply
Mootamai Municipal Water District*	Pala-Pauma	Local groundwater supply
Pauma Municipal Water District*	Pala-Pauma	Local groundwater supply
Pine Hills Mutual Water Company*	Julian/Pine Hills	Local groundwater supply

Water Supply Provider	Community Served	Source
Pine Valley Mutual Water Company*	Pine Valley	Local groundwater supply
Questhaven Municipal Water District*	San Dieguito	Local groundwater supply
Rancho Pauma Mutual Water Company*	Pala-Pauma	Local groundwater supply
San Luis Rey Municipal Water District*	Fallbrook, Valley Center, Pala-Pauma	Local groundwater supply
Wynola Water District*	Julian/Wynola	Local groundwater supply

Note: SDCWA = San Diego County Water Authority.

[1] A sole source aquifer is an underground water supply designated by the U.S. Environmental Protection Agency as the "sole" or "principal" source of drinking water for an area.

* Denotes water supply providers that either do not serve more than 3,000 customers or do not distribute more than 3,000 af of water annually and are therefore not required to have a UWMP.

Borrego Valley Groundwater Subbasin

Desert basins account for approximately 14% of the unincorporated area of the San Diego region and are located in its easternmost portions. These basins are characterized by extremely limited groundwater recharge but large storage capacity. When groundwater extraction exceeds recharge, the result is an overdraft condition that is not sustainable (County of San Diego 2010a). The Borrego Valley Groundwater Basin has a well-documented groundwater overdraft condition. The Borrego Valley Groundwater Basin is divided into two separate subbasins, the Borrego Springs Groundwater Subbasin and the Ocotillo Wells Groundwater Subbasin (DWR 2016). The Borrego Springs Groundwater Subbasin covers an area of approximately 98 square miles, and the Ocotillo Wells Groundwater Subbasin covers an area of approximately 141 square miles (of which approximately 44% is located in San Diego County; the remainder of the Ocotillo Wells Groundwater Subbasin is located in Imperial County).

Current groundwater use in the Borrego Springs Groundwater Subbasin greatly exceeds groundwater recharge, and the Subbasin is designated by DWR as high priority and critically overdrafted (BVGSA 2019). The Coyote Creek, Upper San Felipe Creek, and the Borrego Valley–Borrego Sink Wash watersheds drain to the Borrego Springs Subbasin and provide the majority of recharge for the subbasin. Due to its arid climate, the Borrego Springs Subbasin receives limited precipitation and is remote for potential sources of imported water. The Borrego Springs Groundwater Subbasin holds a large amount of groundwater in storage, estimated in 2016 to be approximately 1.5 million af of usable groundwater (BVGSA 2019). Water levels have been declining for decades because of the overdraft condition, and groundwater production at current rates is not sustainable. Since the early 1950s, pumping for irrigated agriculture, golf courses, and residential and commercial uses has required more groundwater than is available through natural recharge. Groundwater-level declines during 1945–2010 were as much as 2 feet per year in wells in the northern part of the valley, where groundwater is intensively pumped for irrigated agriculture (USGS 2017). Over the past 65 years, groundwater levels have declined as much as 126 feet in the northern portion and by approximately 87 feet in the west-central portion of the subbasin. Less groundwater has been pumped in the southeastern part of the subbasin, and groundwater levels have remained relatively stable in this portion of the subbasin. While the majority of residences and commercial entities in Borrego Valley receive their water from the Borrego Water District (BWD), some private property owners within the BWD service area use private wells that rely on groundwater extracted from the Borrego Springs Groundwater Subbasin. The vast majority of the water supplied to agricultural users within Borrego Valley comes from privately owned wells within the BWD service area (County of San Diego 2010b).

In order to comply with the SGMA (see the "Regulatory Setting" section below), efforts began in 2017 to prepare a GSP for the Borrego Springs Groundwater Subbasin. A public input process was conducted, and a draft GSP prepared and circulated. The final draft GSP was completed in 2019. Ultimately, BWD filed a lawsuit seeking a comprehensive adjudication of groundwater rights in the subbasin in 2021. The adjudication of groundwater pumping rights in the Borrego Springs Groundwater Subbasin was approved by the Superior Court of California on April 8, 2021 (Case No. 37-2020-00005776) (2021 Judgment). The 2021 Judgment provided for holders of

groundwater rights in Borrego Springs to work together alongside the county and BWD to manage the Borrego Springs Groundwater Subbasin through a court-approved process. To accomplish this, the 2021 Judgment established the Borrego Springs Watermaster (Watermaster) as the entity responsible for managing groundwater resources in the Borrego Springs Groundwater Subbasin. On June 25, 2021, the Watermaster submitted the 2021 Judgment to DWR that included a groundwater management plan (GMP), constituting a "physical solution" for DWR review and approval to serve as an alternative to a GSP for the subbasin in compliance with the SGMA. The 2021 Judgment established an initial sustainable yield (i.e., the amount of water that may be produced), as well as Watermaster rules and regulations.

The Watermaster updated baseline pumping allocations on October 1, 2024. The pumping allocations provide specific quantities available to specific landowners (Borrego Springs Watermaster 2024). The most recent annual report for the Borrego Springs Groundwater Subbasin was published in March 2024 and addressed water year 2023. This report, prepared to satisfy requirements of the 2021 Judgment, described above, provides a summary of Watermaster activities, water right accounting, hydrologic conditions, and the status of the progress associated with the implementation of the groundwater monitoring plan (West Yost 2024). All users will be required to ratchet down the amount of water they take from the aquifer by 5% each year. By 2030, all will have halved their baseline amounts and will reach a sustainable yield by 2040. (See *Borrego Water District v. All Persons who Claim a Right to Extract Groundwater in the Borrego Valley Groundwater Subbasin No. 7.024-01 Whether Based on Appropriation, Overlying Right, or Other Basis Of Right, and/or Who Claim a Right to use of Storage Space in the Subbasin.*)

ANTICIPATED EFFECTS OF CLIMATE CHANGE

The San Diego region is likely to experience a variety of climate change impacts including longer and more intense droughts, sea-level rise of up to 1.3 feet by 2050 and up to 6.7 feet by 2100, fewer rainy days, more rainfall during the biggest rainstorms by 2050, and a decrease in runoff and streamflow due to less snowpack and more evaporation (CEP and SDF 2015; Kalansky et al. 2018; OPC 2024; Jennings et al. 2018). Climate change is likely to have an impact on both imported and local water supplies for the San Diego region. Imported supply could be reduced by changes in snowpack melt (affecting the timing of water availability), less precipitation, increased evaporation from higher temperatures, and saltwater intrusion due to sea-level rise. Meanwhile, demand for water could increase due to evapotranspiration and droughts. Reduced snowpack and precipitation, as well as more precipitation falling as rain rather than snow in the mountains, can decrease water supplies coming from the mountain ranges. These effects reduce the amount of runoff and streamflow from melted snow, decreasing this source of water. Such changes have already affected the Colorado River, which has seen a decline in streamflow by 19 percent since 2000 due to decreased precipitation (Hogan and Lunquist 2024).

A shift in the timing of melting snowpack can also affect streamflow timing and volumes, water storage, conveyance infrastructure, and ultimately availability of regional water supply. Snowpack usually melts in the spring and summer, releasing water when it is most needed; however, snow has melted earlier in recent years, reducing the amount of water available later in the year (Hale et al. 2023). Between 1981 and 2020, March snow water equivalent has declined by 10 to 20 percent per decade across southwestern USA (Gottlieb and Mankin 2024).

The City of San Diego imports up to 90 percent of its water from Northern California (Sierra Nevada meltwater) and the Colorado River (City of San Diego 2025). 72 percent of the region's water comes from the Colorado River (Elmer 2023). Other impacts of climate change, such as reduced precipitation, increased evaporation, and increased drought, can also make water sources drier. SDCWA anticipates an increase in regional demand of less than one percent per year through 2045 (SDCWA 2021c).

Sea-level rise could result in saltwater intrusion along coastline water sources. Saltwater intrusion degrades freshwater supply, decreasing the amount of drinking water available to the San Diego region. Saltwater intrusion would affect the Sacramento-San Joaquin Bay-Delta, which the San Diego region receives imported water from via the State Water Project (DWR 2025; SDCWA 2025c), as well as groundwater wells (County of San Diego 2023).

SDCWA has diversified its portfolio to include local sources of water such as seawater desalination, ground water, water recycling, water purification, and surface water (SDWCA 2025d) with a goal of recycled water being one-

third of the City's water supply by 2035 (EPA 2025). This new reliance on local sources of water may result in permanent reduction in the availability of groundwater supply (Reidmiller et al. 2018) and increased use of energy. Consumption of large amounts of energy to power desalination plants and import recycled water for purification process (which can be offset by transitioning to a renewable energy or a cleaner energy provider), a resource that may also be compromised by climate change (Kelley 2011).

Drought and evapotranspiration may increase agricultural water demand due to increased irrigation from imported water sources and groundwater to make up for lack of rainfall and to adjust to higher temperatures. Use of groundwater (regulated by the Sustainable Groundwater Management Act) to keep crops irrigated, especially in drought conditions, can lead to dry wells, infrastructure damage from land subsidence (i.e., sinking lands), increased rates of seawater intrusion, and reduced groundwater quality. (Cole et al. 2024).

As climate change and development in the region progress, demand for water is expected to increase while the water supply from traditional sources (e.g., snowpack and streamflow) is expected to decrease.

4.18.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

Safe Drinking Water Act

The Safe Drinking Water Act (42 U.S. Code Section 300[f] et seq.) gives the U.S. Environmental Protection Agency (EPA) the authority to set drinking water standards (40 Code of Federal Regulations [CFR] 141.1 et seq.). Drinking water standards apply to public water systems—systems that provide water for human consumption through at least 15 service connections or regularly serve at least 25 individuals. There are two categories of drinking water standards, the National Primary Drinking Water Regulations (NPDWR) and the National Secondary Drinking Water Regulations (NSDWR). The NPDWR are legally enforceable standards that apply to public water systems. NPDWR standards protect drinking water quality by establishing maximum contaminant levels for specific drinking water contaminants that present a risk to human health. The NSDWR set nonmandatory water quality standards for 15 contaminants that are not considered to present a human health risk.

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

California Water Plan Update 2023

The California Water Plan (CWP), updated every 5 years, is "the state's strategic plan for sustainably and equitably managing and developing water resources for current and future generations" (DWR 2023b). The California Water Plan Update 2023 (Update 2023) focuses on the innovation and investments in California's watersheds, water systems, and communities needed for a resilient and equitable future. The update builds on existing water policies, laws and regulations, and initiatives and investments in the Governor Newsom administration's *Water Resilience Portfolio* (CNRA 2020), Water Supply Strategy (CNRA 2022), and recent legislation. These state initiatives establish cornerstone policies, investments, targets, and actions as significant systemic and institutional challenges that are increasing risks to public safety, frontline communities, ecosystems, and the state's economy. The vision for the Update 2023 is for all Californians to benefit from water resources that are sustainable, resilient to climate change, and managed to achieve shared values and connections to our communities and the environment.

California Water Resilience Portfolio

The California Water Resilience Portfolio was developed in response to Governor Newsom's Executive Order N-10-19, which directed state agencies to develop recommendations to meet water needs throughout the 21st century and enable water security for all Californians (CNRA 2020). State agencies developed the California Water Resilience Portfolio to improve California's capacity to prepare for disruptions, withstand and recover from climate-related shocks, and adapt to the future. The portfolio embraces a broad, diversified approach, with four

categories of goals and actions: (1) maintaining and diversifying water supplies; (2) protecting and enhancing natural ecosystems; (3) improving physical infrastructure to store, move, and share water more flexibly and integrate water management; and (4) preparing for new threats. The portfolio recognizes that water resilience will be achieved with local, regional, and tribal leadership, on a region-by-region basis, considering the unique challenges and opportunities in each area. The portfolio includes more than 100 detailed actions to ensure California water systems work for the communities, economy, and environment, which will be implemented based on priority and availability of resources.

Executive Orders B-37-16 and B-40-17

On May 9, 2016, Governor Jerry Brown issued Executive Order B-37-16, calling for the State Water Resources Control Board (SWRCB) to adjust emergency water conservation regulations through the end of January 2017 in recognition of the differing water supply conditions across the state. Executive Order B-40-17 builds on actions taken in Executive Order B-37-16, which remains in effect, to continue making water conservation a way of life in California. The long-term conservation framework includes recommendations to establish permanent water conservation standards and improved agricultural and urban water management planning to better prepare for more frequent and severe droughts due to climate change.

Regulations Related to Recycled Water

Under California Code of Regulations Title 22, the State Department of Public Health established statewide effluent bacteriological and treatment reliability standards for recycled water uses. (On July 1, 2014, the state's Drinking Water Program was transferred to SWRCB.) The standards are based on the potential for human contact with recycled water. Each of California's nine regional water quality control boards (RWQCBs) has established and enforces requirements for the application and use of recycled water. Permits are required from the RWQCB for any recycling operation. Applicants for a permit are required to demonstrate that the proposed recycled water operation is in compliance with Title 22 and will not exceed the groundwater and surface water quality objectives in the regional basin plan. In the San Diego region, the basin plan is the Water Quality Control Plan for the San Diego Basin (9), prepared and administered by the Region 9 San Diego RWQCB (San Diego RWQCB 2021).

The Water Conservation Act of 2009

The Water Conservation Act of 2009 (Senate Bill [SB] x7-7 of 2009) sets water conservation targets and efficiency improvements for urban and agricultural water suppliers. The legislation established a statewide target to reduce urban per capita water use by 20% by 2020. Urban retail water suppliers were required, individually or on a regional basis, to develop an urban water use target by December 31, 2010, to meet their target by 2020, and to meet an interim target (half of their 2020 target) by 2015. Urban water suppliers cannot impose conservation requirements on process water (water used in production of a product) and are required to employ two critical efficient water management practices—water measurement and pricing. Urban retail water suppliers were required to include information, such as the baseline daily per capita water use, water use target, interim water use target, and compliance daily per capita water use in the water management plan. Urban retail water suppliers who did not meet the water conservation requirements established by this bill were not eligible for state water grants or loans as of 2016.

2018 Water Conservation and Drought Planning Legislation

SB 606 and AB 1668 of 2018 (Chapters 14 and 15, Statutes of 2018) modify several provisions of the Water Conservation Act of 2009. These bills call for the creation of new urban efficiency standards for indoor use, outdoor use, and water loss to leaks, as well as any appropriate variances for unique local conditions. SWRCB was required to adopt these standards by regulation no later than June 30, 2022. The indoor water use standard is required to be 55 gallons per capita per day through December 31, 2024, decreasing to 47 gallons per capita per day from January 1 2025 through December 31, 2029, and decreasing to 42 gallons per capita per day beginning January 1, 2030 (Chapter 679, Statutes of 2022). Each urban retail water agency is required annually, beginning November 2023, to calculate its own water use objective, using SWRCB standards and based on the water needed in its service area, for efficient indoor residential water use; outdoor residential water use; commercial, industrial,

and institutional irrigation; and other uses. In addition, AB 1668 creates additional requirements for agricultural water management plans originally required by the Water Conservation Act of 2009.

California Urban Water Management Planning Act

The California UWMPA (Water Code Part 2.6) states that each urban water supplier that provides water to 3,000 or more customers, or that provides more than 3,000 af of water annually, should make every effort to ensure the appropriate level of reliability in its water service is sufficient to meet the needs of its various categories of customers during a normal year, a dry year, and multiple dry years by preparing a UWMP and updating it every 5 years. The last required UWMP updates were completed in 2021. The UWMPA describes the contents of UWMPs and requires each agency's UWMP to assess the reliability of the agency's water resources over a 20-year planning horizon.

SB 606 of 2018 created additional requirements for UWMPs, including preparation of a drought risk assessment and a water shortage contingency plan. It also requires urban water suppliers conduct an annual water supply and demand assessment and submit an annual water shortage assessment report to DWR.

Water Supply Planning

SB 610 (Chapter 643, Statutes of 2001) and SB 221 (Chapter 642, Statutes of 2001) improve the link between information about water supply availability and certain land use decisions made by cities and counties. SB 610 requires local public water providers with more than 3,000 service connections to prepare a water supply assessment (WSA) for any project that is subject to the California Environmental Quality Act (CEQA) and meets specified minimum size criteria.

For qualified projects, the WSA must document sources of water supply, quantify water demands, and compare future water supply and demand to show that sufficient water will be available to serve the project. Water supply must be assessed for a normal year, a single dry year, and multiple dry years during a 20-year forecast. If supplies are found to be insufficient to serve the project, the WSA must include plans for acquiring sufficient supplies. The WSA must be included in the CEQA document for the project.

SB 221 (Chapter 642, Statutes of 2001) applies to subdivisions of more than 500 dwelling units. Like SB 610, it is intended to ensure an adequate water supply for new development is available. The SB 221 tentative map approval process requires verification of adequate water supply for the subdivision. Government Code Section 66473.7(k) contains special provisions for SB 221 compliance in the San Diego region.

California Groundwater Management Act

The Groundwater Management Act (Water Code Section 10750 et seq.) provides guidance for applicable local agencies to develop voluntary GMPs in state-designated groundwater basins. GMPs can allow agencies to raise revenue to pay for measures influencing the management of the basin, including extraction, recharge, conveyance, facility maintenance, and water quality. SGMA (see below) requires preparation of GSPs for the high- and medium-priority basins instead of GMPs. New GMPs shall not be adopted, and an existing GMP shall not be renewed for high- and medium-priority basins pursuant to SGMA as of January 1, 2015.

Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act (Chapters 346, 347, and 348, Statutes of 2014) encompasses three bills: Assembly Bill (AB) 1739, SB 1168, and SB 1319 of 2014. The act focuses on the importance of local action in order to achieve groundwater sustainability and allow local agencies to tailor sustainable groundwater plans to their own economic and environmental needs. The act created a timeline for its implementation: by 2017, local groundwater management agencies were identified; by January 31, 2020, groundwater sustainability plans must be adopted for basins designated as high or medium priority currently being overdrafted; by January 31, 2022, groundwater sustainability plans must be adopted for all other high- and medium-priority basins; and by 2040, all high- and medium-priority groundwater basins must achieve sustainability. SWRCB has the authority to intervene in sustainability plan preparation if deadlines are not met by local agencies.

The formation of groundwater management agencies results in the monitoring of well water pumping from the managed aquifer along with the calculation of a sustainable yield. Once a sustainable yield has been determined, a basis exists for a groundwater trading program that allows users to purchase or lease the rights of other users while staying within the overall withdrawal limits set by the groundwater sustainability plan.

SGMA is meant to stop the overdrafting of groundwater supplies and to reduce the potential for groundwater contamination by saltwater infiltration. It aims to supply California with a reliable water source for the future. Making Conservation a California Way of Life Regulation

The Making Conservation a California Way of Life regulation was approved by SWRCB in 2024 and became effective on January 1, 2025. The intention of the regulation is to achieve long-term water use efficiency with the purpose of adapting to climate changes and more intense droughts in California. Under the regulation, each urban retail water supplier in California is required to establish individualized and quantifiable urban water use objectives. Each supplier is required to calculate their objective annually, which is the sum of efficiency budgets for a subset of urban water uses, including residential indoor and outdoor water uses, real water loss and commercial, industrial and institutional landscapes with dedicated irrigation meters. Urban retail water suppliers are also required to comply with performance measures established for CII (commercial, industrial, and institutional) water users. Each urban retail water supplier is required to submit an annual report that includes their urban water use objective and a description of progress made towards meeting their urban water use objective to SWQCB and DWR by January 1 every year.

Assembly Bill 1572

AB 1572 was signed into law by Governor Newsom in October 2023. The bill restricts the use of potable water for irrigating non-functional turf on commercial, industrial, institutional, and multifamily residential properties, other than a cemetery, and on properties of homeowners' associations, common interest developments, and community service organizations or similar entities.

Caltrans' Statewide Stormwater Management Plan

In the state of California, methods of accommodating storm water in new transportation improvements financed entirely or in part with state or federal funds are governed by Caltrans design standards outlined in the Caltrans' Statewide Stormwater Management Plan. Caltrans standards also typically serve as the basis for municipal designs because the municipalities operate under similar NPDES permit requirements. Caltrans transportation improvements related to storm water management include the following design principles (Caltrans 2016):

- Conserve natural areas to the extent feasible, including existing trees, stream buffer areas, vegetation, and soils.
- Minimize the impervious footprint of the project.
- Minimize disturbances to natural drainages.
- Design pervious areas to effectively receive runoff from impervious areas, taking into consideration the pervious areas' soil conditions, slope, and other pertinent factors.
- Incorporate landscape and soil-based BMPs [best management practices].
- Use climate appropriate landscaping that minimizes irrigation and runoff, promotes surface infiltration, and minimizes the use of pesticides and fertilizers.
- Design landscapes to comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance.[1] This includes any new (or rehabilitated) planting area provided with permanent irrigation (greater than 2,500 square feet) except for mitigation planting and erosion control projects with temporary irrigation systems.

[1] Any landscape design that consists of new or rehabilitated landscape irrigation in the project limits (greater than 2,500 square feet per AB 1881) will comply with the California Department of Water Resources Model Water Ordinance by estimating water needs using the following guidance resources: WULCOLS III (Water Use Classifications of Landscape Species), MAWA (Maximum Allowable Water Allowance), and ETWU (Estimated Total Water Use).

- Where the California Department of Water Resources Model Water Efficient Landscape Ordinance conflicts with a local water conservation ordinance, Caltrans will comply with the local ordinance.

REGIONAL AND LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

Both MWD and SDCWA have developed plans that address long-term water supply and demand, as well as catastrophic supply interruption and emergency storage. These plans, as they relate to the issues in this Environmental Impact Report (EIR), are described below.

MWD Integrated Water Resources Plan

The MWD 2020 Integrated Water Resources Plan (IRP) was organized into a regional needs assessment (phase 1) and an implementation plan (phase 2). The needs assessment was adopted by the MWD Board of Directors in 2022, established a tool for ensuring regional water reliability through 2045, and incorporated scenario planning to address wide-ranging uncertainties (MWD 2023). Building upon the foundation of the IRP needs assessment, phase 2 of the IRP will be coordinated through the Climate Adaptation Master Plan for Water that was approved in April 2025 and considers climate scenarios for water resource development and management (MWD 2025).

MWD Urban Water Management Plan

MWD prepared the 2020 UWMP in compliance with Water Code Sections 10608.36 and 10610–10656 of the UWMPA. Information in MWD's 2020 UWMP may be used by local water suppliers in preparation of their own UWMP and represents current planning projections of supply capability and demand. The UWMP describes MWD's planning activities and explains how the agency will manage the region's water resources to ensure a reliable water supply for the region. The UWMP also addresses the issue of water quality and steps taken to deliver high-quality water to the MWD service area (MWD 2021).

SDCWA Urban Water Management Plan and Water Use Efficiency Programs

The SDCWA 2020 UWMP presents strategies designed to enhance water supply reliability through diversification of water sources, compliance with the Water Conservation Act of 2009 conservation targets, and improvement of supply and delivery infrastructure, including improvements identified in the SDCWA 2015 UWMP (SDCWA 2016). Some of the more prominent strategies are the All-American Canal and Coachella Canal Lining Projects, development of a regional seawater desalination plant located in Carlsbad, construction of the San Vicente Dam Raise and Carryover Storage Project, and support of the development of additional local supplies. The UWMP describes SDCWA's outreach efforts to raise public awareness of growing water supply and water rate challenges and increased long-term residential, commercial, and public sector water use efficiency. The 2020 UWMP is based on SANDAG's Series 14 Regional Growth Projections.

In addition, SDCWA's Water Use Efficiency Policy Principles include how SDCWA may implement and administer regional water use efficiency projects and programs where economies of scale, geography considerations, or other member agency circumstances make a regional program more efficient or cost-effective. The principles also provide additional direction to staff regarding efficiency projects or programs affecting SDCWA, its member agencies, and regional water management and use. The principles include policies pertaining to member agency support, funding and resources, program performance, outreach and education, and regulation and legislation.

SDCWA Water Shortage Contingency Plan

The 2020 Water Shortage Contingency Plan (WSCP) provides an overview of SDCWA's actions to increase the region's water supply reliability and to outline the response to drought or other water shortage emergencies (SDCWA 2021b). It builds upon previous planning documents, as well as the experience gained in two previously declared droughts in this century. The WSCP provides a review of historical drought periods along with SDCWA's actions and lessons learned during those periods. The WSCP summarizes the annual water supply and demand assessment. Six regional water shortage response actions and levels are presented, including actions required at each level and the water supply conditions that trigger the response levels. The WSCP identifies extraordinary demand reduction measures, which include a list of potential consumer water use restrictions and extraordinary

measures to reduce demand during shortage events. A detailed methodology for allocation of supplies to member agencies in a water supply shortage is presented. A description of how SDCWA would manage catastrophic water shortages caused by an event such as an earthquake is outlined.

San Diego Integrated Regional Water Management Plan

The 2019 San Diego Integrated Regional Water Management Plan (IRWMP) presents an integrated approach for addressing water management issues in the San Diego region. The 2019 San Diego IRWMP focuses on five goals (IRWM 2018):

- Improve the reliability and sustainability of regional water supplies.
- Protect and enhance water quality.
- Protect and enhance our watersheds and natural resources.
- Enhance the resiliency to climate change for local water resources.
- Promote and support sustainable integrated water resource management.

ISDCWA Water Facilities Master Plan

The SDCWA 2024 Water Facilities Master Plan (2024 Master Plan) is a comprehensive evaluation of infrastructure requirements needed to meet SDCWA's mission of providing a safe and reliable water supply to its member agencies. It is based on projections for future water demands and water supplies from the 2020 UWMP (SDCWA 2025a). The 2024 Master Plan identifies infrastructure improvement projects needed to ensure reliability and ability to serve projected water demands to 2045. Projects include water facilities seismic improvements, upgraded pump stations, and pipeline relining.

Local Urban Water Management Plans and Water Use Efficiency Programs

The California UWMPA (Water Code Part 2.6) requires each of the 22 SDCWA member agencies to prepare a UWMP to support long-term resource planning and ensure adequate water supplies are available to meet existing and future water demands. SDCWA member agencies' UWMPs reflect and are coordinated with the SDCWA UWMP. Local agencies with a UWMP include the City of Carlsbad, the City of Escondido, the Fallbrook Public Utility District, Helix Water District, Lakeside Water District, the City of Oceanside, Otay Water District, Rainbow Municipal Water District, Rincon Del Diablo Municipal Water District, Ramona Municipal Water District, the City of San Diego, San Dieguito Water District, Santa Fe Irrigation District, Sweetwater Authority, Valley Center Municipal Water District, Vallecitos Water District, Vista Irrigation District, the City of Poway, Olivenhain Municipal Water District, and Padre Dam Municipal Water District.[2]

SDCWA also runs a water conservation program known as WaterSmart, which is implemented by SDCWA member agencies. The program offers various water conservation resources, programs, and incentives for residences, businesses, homeowner associations, and agricultural use management programs (SDCWA n.d.).

San Diego County Groundwater Ordinance

The San Diego County Groundwater Ordinance is contained in Section 67.701 et seq. of the Regulatory Code. This ordinance contains regulations for the protection, preservation, and maintenance of groundwater resources. It provides standards for implementation and review of groundwater studies, as well as countywide studies, assessments, and monitoring of groundwater resources in the county. The purpose of this ordinance is not to limit or restrict agricultural activities but to ensure that development will not occur in groundwater-dependent areas of the county unless adequate groundwater supplies are available to serve both the existing uses and the proposed uses in the affected groundwater basin. The economic, social, and environmental benefits of maintaining viable agriculture in San Diego County are expressly recognized in the adoption of this ordinance. Also, the Groundwater Ordinance does not apply to by-right agricultural uses or operations. This ordinance does not limit the number of

[2] Since approval of the 2020 UWMP, Fallbrook Public Utility District and Rainbow Municipal Water District have detached from SDCWA and annexed into Eastern Municipal Water District.

wells or the amount of groundwater extraction from existing landowners. However, the ordinance does identify specific measures to mitigate potential groundwater impacts of projects requiring specified discretionary permits.

Groundwater Sustainability Plan for the Borrego Springs Groundwater Subbasin

The final draft GSP for the Borrego Springs Groundwater Subbasin was completed in 2019. The GSP establishes criteria that will maintain or achieve sustainable groundwater management of the Borrego Springs Groundwater Subbasin. The GSP contains a summary of the Borrego Springs Groundwater Subbasin setting and overdraft conditions; establishes sustainability indicators, minimum thresholds, and measurable objectives for the subbasin; and establishes project and management actions to reduce water demand within the subbasin and maintain water quality suitable for current and future beneficial uses. The Borrego Springs Groundwater Subbasin GSP establishes a sustainability goal to halt the overdraft condition in the subbasin by bringing the groundwater demand in line with a sustainable yield of 5,700 afy by 2040, while stabilizing or improving groundwater levels (BVGSA 2019).

As discussed above in the "Borrego Valley Groundwater Subbasin" section, a settlement agreement to adjudicate groundwater rights was approved on April 8, 2021, and established the Borrego Springs Watermaster as the entity responsible for managing groundwater use in the Borrego Springs Groundwater Subbasin. Under the terms of the settlement agreement, all parcels within the BWD service area will be metered to measure water use. All users will be required to ratchet down by 5% each year the amounts of water they take from the aquifer. By 2030, all users will have halved their baseline amounts and will reach a sustainable yield by 2040. (See *Borrego Water District v. All Persons Who Claim a Right to Extract Groundwater in the Borrego Valley Groundwater Subbasin No. 7.024-01 Whether Based on Appropriation, Overlying Right, or Other Basis Of Right, and/or Who Claim a Right to use of Storage Space in the Subbasin*.)

Recycled Water Regulations

The County Department of Environmental Health and Quality regulates the use of recycled water through a delegation agreement with the State of California. The purpose is to protect the public from health risks associated with cross-connections of recycled water and drinking water supplies, as well as to prevent health risks from body contact with recycled water. The department's Land and Water Quality Division reviews recycled water use plans and conducts site inspections to ensure drinking water supplies are not contaminated with recycled water. Spray irrigation sites are monitored to ensure the recycled water irrigation does not present a risk to the public. Recycled water sites must also pass a cross-connection control shutdown test when installed and every 4 years after installation (County of San Diego n.d.-e).

The City of San Diego maintains the policy that recycled water be used for any purpose approved for recycled water use when it is economically, financially, and technically feasible, as mandated by Ordinance 0-17327. The policies regarding recycled water use are documented in the Rules and Regulations for Recycled Water Systems, which lists the following goals (City of San Diego 2022):

- Prevent direct human contact of recycled water through adherence to all applicable rules and regulations and laws.
- Prevent cross-connection between recycled and potable water systems, which include a strict cross-connection/backflow prevention program.

In addition to the county regulations, the City of Escondido's Recycled Water Master Plan summarizes the City's recycled water service rules and regulations for recycled water use (City of Escondido 2011). The San Dieguito Water District Administrative Code Article 21, Section 21.6, "Rules and Regulations," govern the requirements for recycled and nonpotable water use within the district's jurisdiction (City of Encinitas 2024). Olivenhain Municipal Water District's Rules and Regulations Governing the Use of Recycled Water describes the facility requirements, recycled water services, and operational requirements in the jurisdiction (OMWD 2015). Recycled water use in the Rincon del Diablo Municipal Water District is governed by Rincon Administrative Code Section 4500, "Recycled Water Service" (RDDMWD 2017).

4.18.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for evaluating the significance of a project's environmental impacts on water supply, in the form of initial study checklist questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the checklist questions in CEQA Guidelines Appendix G. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR and the unique nature of the proposed Plan.

Checklist questions for water supply are included in Sections X (b and e) and XIX (a and b) of Appendix G. Because of the importance of water supply issues in the San Diego region and throughout California, this EIR addresses the water supply impacts of the proposed Plan in a stand-alone section. For the purposes of this EIR, the Appendix G questions have been combined and modified. Specifically, Appendix G Section XIX (b), regarding sufficient water supplies, is addressed in criterion WS-1. Section X questions (b) and (e), regarding groundwater supplies and sustainable groundwater management plans, are addressed in criterion WS-2. Section XIX question (a), regarding the relocation or construction of new or expanded water facilities, is addressed in criterion WS-3. For the purposes of this EIR, the proposed Plan would have a significant water supply impact if it would:

WS-1 Not have sufficient water supplies available to serve the projected regional demand during normal, dry, and multiple dry years.

WS-2 Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the proposed Plan would impede sustainable management of groundwater basins or obstruct implementation of a sustainable groundwater management plan.

WS-3 Require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects.

4.18.4 Environmental Impacts and Mitigation Measures

WS-1 NOT HAVE SUFFICIENT WATER SUPPLIES AVAILABLE TO SERVE THE PROJECTED REGIONAL DEMAND DURING NORMAL, DRY, AND MULTIPLE DRY YEARS.

Analysis Methodology

The analysis of the 2035 and 2050 impacts of forecasted regional growth and land use change in the SDCWA service area estimates the water demand resulting from forecasted growth under the proposed Plan and compares it to the projected water demand and projected available supplies through 2035, as identified in the SDCWA 2020 UWMP. The UWMPA requires all urban water suppliers in California to prepare UWMPs that present the water suppliers' water reliability assessments. The assessments must compare projected water supply and demands over the ensuing 20 years. The SDCWA 2020 UWMP's water reliability assessment covers 20 years, from 2025 to 2045. The assessment must include projected water supply and demand in 5-year increments under normal, single dry, and multiple dry years. The regional growth projections used in the SDCWA 2020 UWMP were based on the SANDAG Series 14 Regional Growth Forecast. As explained in Chapter 2, "Project Description," the proposed Plan's growth projections were based on the Series 15 Regional Growth Forecast, which projects a slower population growth rate compared to the previous forecasts based on the Series 14 model. As such, the forecasted regional growth under the proposed Plan would be more conservative than the forecasted growth used in the SDCWA 2020 UWMP for water reliability assessments. The water demand resulting from the proposed Plan would be within the demand forecasted in the SDCWA 2020 UWMP. Therefore, the UWMP is suitable for answering Impact WS-1. Information in this section is derived from the SDCWA 2020 UWMP unless otherwise indicated.

The analysis of regional water demands below is based on projections of both normal year and dry-year annual demands from the 2020 UWMP. Normal-, dry-, and multiple-dry-years annual demands were consistent with those in the 2020 UWMP for each member agency. Projected water supply for a normal water year is based on forecasts provided by the 2020 UWMP in the SDCWA service area in a normal water year and single dry water year through 2045.

For the 2050 analysis of regional growth and land use change, the water demand was estimated by multiplying the projected per capita usage in gallons per day by forecasted future population. Most urban areas in the region depend upon a combination of surface water, recycled water, and water conservation to provide sufficient water supplies for their existing and planned residents and businesses. Table 4.18-12 shows the 2020 UWMP normal water year assessment, summarizing the total water demands in the SDCWA service area through the year 2045.

A 2050 population of 3,400,250 is forecasted under the proposed Plan. Of this total, approximately 109,841 people are projected to reside outside the SDCWA service area based in GIS overlay analysis of SANDAG's MGRA 15 and SDCWA service area boundaries (SANDAG 2025; County of San Diego 2024). For a conservative approach, this analysis assumes that the forecasted 2050 population of 3,400,250 people would be served by SDCWA. Water demand in 2050 was estimated using the 2020 UWMP assumptions for population and water demand in 2045 for normal year conditions. These assumptions were used to develop per capita rates for each scenario (i.e., af per person during a normal year, a single dry year, multiple dry years). These per capita rates were then applied to the forecasted 2050 population to calculate the following 2050 water demands under the proposed Plan. The estimated water demand for 2050 is 578,043 af.

The construction of new transportation network improvements, including roadways, bicycle and pedestrian facilities, and transit facilities, and the operation and maintenance of new facilities could increase the demand for water for construction activities, such as concrete mixing and dust control, and for operations activities and services, such as restrooms and drinking fountains. These water demands are evaluated qualitatively to determine whether they could contribute to a situation where regional demand exceeds water supply.

Table 4.18-12 2020 UWMP Normal Water Year Supply and Demand Assessment (acre-feet/year)[1]

	2025	2030	2035	2040	2045
Water authority supplies					
Imperial Irrigation District water transfer	200,000	200,000	200,000	200,000	200,000
All-American Canal and Coachella Canal Lining Projects	78,700	78,700	78,700	78,700	78,700
Carlsbad Desalination Plant	50,000	50,000	50,000	50,000	50,000
Subtotal	*328,700*	*328,700*	*328,700*	*328,700*	*328,700*
Member agency supplies					
Surface water	43,957	43,957	44,659	44,659	44,659
Water recycling	41,963	45,513	45628	45,749	45,854
Seawater desalination	6,000	6,000	6,000	6,000	6,000
Potable reuse	33,042	53,202	112,562	112,562	112,562
Brackish groundwater recovery	8,400	8,400	8,400	8,400	8,400
Groundwater	21,900	23,100	23,100	19,600	19,600
San Luis Rey water transfers	15,800	15,800	15,800	15,800	15,800
Subtotal	*171,062*	*195,972*	*256,149*	*252,770*	*252,875*
Metropolitan Water District supplies	55,996	53,572	13,625	32,765	49,196
Total projected supplies	**555,758**	**578,244**	**598,474**	**614,235**	**630,771**
Total long-range demand forecast with conservation[2]	**555,758**	**578,244**	**598,474**	**614,235**	**630,771**

Notes: UWMP = urban water management plan; SDCWA = San Diego County Water Authority; MWD = Metropolitan Water District of Southern California.

[1] Normal water year demands are based on 1960–2018 hydrology.

[2] Supply and demand are identical because the residual shortfall after accounting for SDCWA and member agency supplies is offset by purchases from MWD.

Source: SDCWA 2021a: Table 9-1.

A significant impact would occur if the projected available regional water supplies and water delivery infrastructure are not able to meet regional demand during normal year, dry year, and multiple dry year scenarios. The analysis is done for 2035 and 2050.

Transportation network improvements have the potential to affect groundwater supplies through storm water runoff. Storm water is defined by EPA as the runoff generated when precipitation from rain and snowmelt events flows over land or impervious surfaces without percolating into the ground (SWRCB n.d.). Storm water is often considered a nuisance because it mobilizes pollutants, such as motor oil and trash. Storm water discharges in California are regulated through National Pollutant Discharge Elimination System (NPDES) permits. Transportation network improvements made in already urbanized areas, such as the Central County Subregion, create less impact because they do not represent a substantial increase in impervious surfaces. Water quality aspects of storm water originating from transportation network improvements are analyzed in Section 4.10, "Hydrology and Water Quality." At issue are the effects of storm water originating from network transportation improvements on the water supplies of underlying aquifers. As noted by SWRCB, storm water may act as a resource and recharge to groundwater when properly managed (SWRCB n.d.).

A qualitative analysis is included for water required for the production of concrete and dust suppression and for the operation and maintenance water demands (e.g., landscape irrigation) of transportation network improvements. A significant impact would occur if existing and future water supplies in the San Diego region would not be sufficient to meet regional water demands associated with transportation network improvements.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. Table 4.18-12 indicates that SDCWA projects adequate water supply to meet the 2035 demand of regional growth and land use change. Total water demand for 2035 is projected to be 598,474 af. Sources include the following SDCWA supplies, which total 328,700 af:

- Imperial Irrigation District water transfer
- All-American Canal and Coachella Canal Lining Projects
- Carlsbad Desalination Plant

The water derived from the Imperial Irrigation District and the canal lining projects is stored by MWD in Lake Mead and becomes part of the MWD water supply. Under an agreement between MWD and SDCWA, MWD agrees to provide a like amount of water from its overall supply (MWD 2021).

Member agency supplies that contribute to the regional water supply from the following sources total 256,149 af:

- surface water
- water recycling
- seawater desalination
- potable reuse
- brackish groundwater recovery
- San Luis Rey water transfers

In addition to the above supplies, SDCWA would purchase 13,625 af from MWD. MWD projects that the total retail water demand for San Diego County with conservation would be approximately 604,000 af in 2035 (MWD 2021).

Therefore, the estimated SDCWA water demand (13,625 af) from MWD in 2035 would be within the water demand projected (approximately 604,000 af) by MWD in its 2020 UWMP. MWD would have sufficient water supply to meet the water demand from SDCWA in 2035.

In the single dry year assessment for 2035, SDCWA assumed the continuation of long-term water efficiencies, but conservatively did not include additional potential savings derived from extraordinary conservation occurring during droughts. The groundwater and surface water yields assumed in the 2035 single dry year scenario are based on the very low yields of 2015. Other SDCWA supplies and member agency supplies were considered drought resilient. Dry year assessments in 5-year increments are presented in Table 4.18-13.

Table 4.18-13 Single Dry Year Supply and Demand Assessment in 5-Year Increments (acre-feet/year)

	2025	2030	2035	2040	2045
Water authority supplies					
Imperial Irrigation District water transfer	200,000	200,000	200,000	200,000	200,000
All-American Canal and Coachella Canal Lining Projects	78,700	78,700	78,700	78,700	78,700
Regional Seawater Desalination	50,000	50,000	50,000	50,000	50,000
Subtotal	***328,700***	***328,700***	***328,700***	***328,700***	***328,700***
Member agency supplies[1]					
Surface water	6,004	6,004	6,004	6,004	6,004
Water recycling	41,963	45,513	45,628	45,749	45,854

Source: SDCWA 2021a: Table 9-2.

[1] Member agency local supplies include production from verifiable reliable sources, as well as dry year totals for actual 2015 surface water and groundwater supplies.

The SCDWA 2035 dry year assessment assumes a major increase in water purchase from MWD. Purchases from MWD would increase from 13,625 af under the 2035 normal year scenario to 337,116 af under the 2035 dry year scenario. The SCDWA 2020 UWMP states (SDCWA 2021a):

> For this single dry-year assessment, it was assumed that Metropolitan supplies are limited to 1.3 million AF [acre-feet] due to dry conditions and additional reduction in Metropolitan's deliveries from State Water Project (i.e., no Delta improvements) and Colorado River, and that the Water Authority received its preferential right based on Metropolitan's current method of calculating such rights.

MWD member agencies' ability to exercise preferential water rights was confirmed in a lawsuit filed by SDCWA in 2001. The court decision affirmed the preferential right of each member agency to MWD water. The calculation of each member agency's preferential rights was clarified in a 2010 lawsuit filed by SDCWA regarding payments to transport its independent Colorado River supplies through the MWD conveyance system (SDCWA 2021a). As of June 30, 2020, SDCWA has preferential right to 25.83% of MWD's water supplies (SDCWA 2021a). In fiscal year 2023, SDCWA purchased about 7.3% of the water MWD sold (SDCWA 2024b). The MWD UWMP single dry year water supply is projected to be 2,760,000 af in 2035 (MWD 2021). The SDCWA 2035 single dry year water demand from MWD (337,116 af) would represent approximately 12.2% of the MWD 2035 single dry year water supply. Although preferential rights are updated annually, the approximately 12.2% of the MWD 2035 single dry year water supply is less than the SDCWA 2020 preferential right to MWD's water supplies (25.83%). The MWD 2035 single dry year water supply projection suggests that MWD would have adequate water supply to meet SDCWA demand assuming exercise of preferential water right.

In a multiple dry years scenario ending in 2035 (see Table 4.18-14), member agency supplies were reduced, reflecting the decline in surface water and groundwater availability. SDCWA supplies derived from water transfers would be maintained at a static level. SDCWA would continue to exercise its preferential right to the MWD supply of water available for wholesale. The MWD UWMP multiple dry year water supply is projected to be 2,241,000 af in 2035 (MWD 2021). The SDCWA 2035 multiple dry year water demand from MWD (311,021 af) would represent approximately 13.8% of the MWD 2035 multiple dry year water supply. The MWD 2035 multiple dry year water supply projection suggests that MWD would have adequate water supply to meet SDCWA demand assuming exercise of the 2020 preferential water right of 25.83%.

Table 4.18-14 2031–2035 Multiple Dry Year Supply and Demand Assessment (acre-feet/year)

	2031	2032	2033	2034	2035
Member agency supplies[1]	215,128	210,674	191,034	167,747	209,675

Source: SDCWA 2021a: Table 9-5.

[1] Member agency local supplies include verifiable recycling and brackish groundwater recovery, potable reuse, San Luis Rey water transfer, seawater desalination, as well as dry year estimates for surface water and groundwater.

The SDCWA and MWD planning documents indicate that there would be sufficient water supplies to satisfy the requirements of regional growth and land development in 2035, including in the event of a single dry year or multiple dry years. Therefore, impacts regarding the availability of an adequate water supply to serve regional growth and land use change in 2035 would be less than significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

The construction of new transportation network improvements, including roadways, bicycle and pedestrian facilities, and transit facilities, and operation and maintenance of new facilities could increase the demand for water for construction activities, such as concrete mixing and dust control, and for operational activities such as landscape irrigation or services such as restrooms and drinking fountains. These increases in demand are anticipated to be small on an individual project basis. For example, a minimal amount of water may be required for dust control during construction and grading activities. Depending on conditions, water use for dust control could be obtained via existing on-site supplies or trucked from an alternative source. This minor, short-term use would be arranged between the contractors and water suppliers and would not contribute to an exceedance of available water supplies. Operational water use would be limited to as needed basis and would not result in substantial increase in demand for portable water. Water use associated with restrooms would occur only when handwashing and flushing toilets are needed. In addition, reclaimed water, of which there is a regional surplus, can be used for restrooms. Similarly, drinking water foundations will only be used when someone needs water.

The construction of new transportation facilities would also increase demand for water use to irrigate new landscaping installed along roadways. Reclaimed water is used for roadway landscaping irrigation in most areas. Landscaping for new Caltrans improvements would be irrigated with recycled water. Any landscaping installed in outlying areas would be composed of native species with minimal water requirements. Water demand for landscaping irrigation is anticipated to be met by reclaimed water and recycled water. The impact would be less than significant.

2035 Conclusion

Water supplies are adequate to serve regional growth and land use change and transportation network improvements and programs until the year 2035. The water supply is adequate to serve these needs even in the event of a dry year or multiple dry years. Therefore, this impact (WS-1) in the year 2035 is less than significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050.

Water demand in 2050 was estimated using the 2020 UWMP assumptions for population and water demand in 2045 for normal year conditions. The per capita rate was then applied to the forecasted 2050 population under the proposed Plan to calculate the 2050 water demand under the proposed Plan. The estimated water demand for 2050 is 578,043 af.

SDCWA and member agency normal year supplies are mostly constant for the 2035–2045 period. Using the 2045 SCWA and member agency normal year supplies for 2050 results in a total local water supply of 582,514 af. The water demand of 578,043 af during a normal year would be within the local water supply.

As shown above in Table 4.18-13, the single dry year assessments prepared for the SDCWA 2020 UWMP do not extend beyond 2045. The single dry year demand estimate in 2050 for the SDCWA service area is 602,372 af, which was derived from using the same methodology employed to estimate 2050 normal year water demand. SDCWA and member agency supplies are mostly uniform across both the 2040 and 2045 single dry year estimates of 538,601 af. Use of these water supply calculations in a 2050 single dry year scenario would result in a shortfall of 63,876 af of water supply in 2050. This quantity would only be available with the exercising of SDCWA's preferential rights to MWD supplies. Because projections of MWD supplies are not available for wholesale in 2050, the availability of this supply cannot be confirmed.

Multiple dry year assessments for the years 2036–2040 and 2041–2045 are presented in Tables 4.18-15 and 4.18-16. In both scenarios, SDCWA member agency supplies, consisting of groundwater and surface water, decline over time. SDCWA supplies derived from water transfers are constant. In all instances, the shortfall between supply and overall demand would be bridged via SDCWA exercising its preferential right and acquiring additional wholesale supplies from MWD.

Table 4.18-15 2036–2040 Multiple Dry Year Supply and Demand Assessment (acre-feet/year)

	2036	2037	2038	2039	2040

Remaining potential surplus supply, or (shortage) that will be addressed through management actions	279,463	242,500	216,258	186,301	162,132

Source: SDCWA 2021a: Table 9-7.

[1] Member agency local supplies include verifiable recycling and brackish groundwater recovery, potable reuse, San Luis Rey water transfer, seawater desalination, as well as dry year estimates for surface water and groundwater.

As discussed above, there are no SDCWA dry year water demand projections after 2045. Because of the year-to-year variations in supply and demand factors in the 2036–2040 and 2041–2045 assessments, estimating for 2046–2050 is technologically infeasible without more detailed input from the water agencies. It is certain, however, that satisfying regional water demand in multiple dry years from 2046 to 2050 would require that SDCWA exercise its preferential rights and acquire well in excess of 300,000 afy. There is no MWD dry year water supply projection after 2045; therefore, it cannot be confirmed how much water SDCWA could acquire through preferential rights in 2050. Because the availability of this water supply cannot be confirmed the impact would be significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

The construction of new transportation network improvements, including roadways, bicycle and pedestrian facilities, and transit facilities, and operation and maintenance of new facilities could increase the demand for water for construction activities, such as concrete mixing and dust control, and for operations activities and services, such as restrooms and drinking fountains. These increases in demand are anticipated to be small on a per-project basis. For example, a minimal amount of water may be required for dust control during construction and grading activities. Depending on conditions, water use for dust control could be obtained via existing on-site supplies or trucked from an alternative source. This minor, short-term use would be arranged between the contractors and water suppliers and would not contribute to an exceedance of available water supplies. Operational water use would be limited to as needed basis and would not result in substantial increase in demand for portable water. Water use associated with restrooms would occur only when handwashing and flushing toilets are needed. In addition, reclaimed water, of which there is a regional surplus, can be used for restrooms. Similarly, drinking water foundations will only be used when someone needs water.

The construction of new transportation facilities would also increase demand for water to irrigate new landscaping installed along roadways. This demand is anticipated to be met by using reclaimed water (also known as recycled water), of which there is a regional surplus and which is typically available for this purpose in most areas. Landscaping for new Caltrans improvements would be irrigated with recycled water. Any landscaping installed in outlying areas would be composed of native species with minimal water requirements. The impact would be less than significant.

2050 Conclusion

The impacts of regional growth and land use change in 2050 would be significant, the impacts of transportation network improvements would be less than significant, and the combined impacts of both would be significant. The UWMPs prepared by SDCWA and MWD indicate that there would be sufficient water supplies to provide for regional growth and land development through the year 2045. After this time, however, documentation regarding sufficient supplies is unavailable, creating uncertainty about regional water supplies in 2050. This uncertainty means that there may be insufficient regional water supplies to meet regional water demand in 2050 in the event of a dry year or multiple dry years. Therefore, this impact (WS-1) in the year 2050 is significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change and transportation network improvements would result in reduced ability to have sufficient water supplies from traditional sources to serve projected regional demand beyond 2045. Climate change impacts multiple sources of water. Reduced precipitation and changes in timing of snowpack melt are likely to decrease the region's imported water supply, which comes from mountain ranges, such as the Sierra Nevada and the mountains that supply the Colorado River (Hogan and Lundquist 2024; Hale et al. 2023; Gottlieb and Mankin 2024; City of San Diego 2025). Increased evaporation and drought may also decrease surface water supplies and result in depletion of groundwater supply (CEP and SDF 2015; SDF 2008). Furthermore, sea-level rise could result in saltwater intrusion of coastal groundwater supplies, decreasing available drinking water (DWR 2025; SDCWA 2025c).

Climate change may also increase water demand. Increased drought and evapotranspiration may increase water demand for agriculture and landscaping irrigation due to lack of rainfall and higher temperatures (Cole et al. 2024). This can further strain water resources supporting the San Diego region.

The proposed Plan's impacts would be worsened by climate change. The proposed Plan's projected population growth would increase water demand, increasing the uncertainty whether the San Diego region will have sufficient water supplies beyond 2045 for projected demand during a normal dry year or multiple dry years.

MITIGATION MEASURES

WS-1 NOT HAVE SUFFICIENT WATER SUPPLIES AVAILABLE TO SERVE THE PROJECTED REGIONAL DEMAND DURING SINGLE DRY YEAR AND MULTIPLE DRY YEARS.

2050

WS-1a Implement Water Conservation Measures for Transportation Network Improvements.

SANDAG shall, and other transportation project sponsors can and should, implement feasible water conservation measures during planning, design, project-level CEQA review, construction, operations, and maintenance of transportation network improvements, consisting of, but not limited to, the following:

- Install drip or other water-conserving or weather-based irrigation systems for landscaping.
- Install native plant species and noninvasive drought-tolerant/low-water-use plants in landscaping, consistent with the most recent state, regional, and local government plans; laws; and policies.
- Incorporate the use of reclaimed water (also known as recycled water) during planning, design, project-level CEQA review, construction, operations, and maintenance of transportation network improvements to reduce the use of potable water.

WS-1b Implement Water Conservation Measures for Development Projects.
The County of San Diego, cities, and other local jurisdictions can and should implement feasible water conservation measures during planning, design, and project-level CEQA review of development projects, consisting of, but not limited to, the following:

- Install native plant species and noninvasive drought-tolerant/low-water-use plants in landscaping, consistent with the most recent state, regional, and local government plans; laws; and policies.
- Install low-flow plumbing fixtures.
- Install water-efficient appliances.
- Incorporate the use of reclaimed water. Measures to incorporate reclaimed water may consist of, but are not limited to, on site water recycling; the use of recycled water to fill lakes, ponds, and ornamental fountains; the use of recycled water for irrigation, to mix concrete, and to control dust at construction sites; the use of recycled water for certain industrial processes and for flushing toilets and urinals in nonresidential buildings; and the use of recycled water for street sweeping purposes.

WS-1c Ensure Adequate Water Supply for Development Projects.
During planning, design, and project-level CEQA review for development projects, the County of San Diego, cities, and other local jurisdictions can and should ensure that adequate water supply will be available to meet or satisfy projected water demands, consistent with applicable UWMPs, master plans, and general plan projections of water supply and demand. This can and should be documented in the form of an SB 610 Water Supply Assessment, an SB 221 Water Supply Verification, or other water supply analysis.

SIGNIFICANCE AFTER MITIGATION

2050

Adequate water supplies have not been identified beyond 2045. This uncertainty means that there may be insufficient regional water supplies to meet regional water demand, notwithstanding implementation of the above mitigation measures. Therefore, this impact (WS-1) is significant and unavoidable.

WS-2 SUBSTANTIALLY DECREASE GROUNDWATER SUPPLIES OR INTERFERE SUBSTANTIALLY WITH GROUNDWATER RECHARGE SUCH THAT THE PROPOSED PLAN WOULD IMPEDE SUSTAINABLE MANAGEMENT OF GROUNDWATER BASINS OR OBSTRUCT IMPLEMENTATION OF A SUSTAINABLE GROUNDWATER MANAGEMENT PLAN.

Analysis Methodology

The analysis addresses the impacts of forecasted regional growth and land use change and transportation network improvements on groundwater supplies both within and outside of the SDCWA service area and determines whether the proposed Plan would impede sustainable management of a groundwater basin or obstruct implementation of a GSP. As stated above, the Upper San Luis Rey Valley GSP was approved by DWR in 2024, and the San Pasqual Valley Groundwater Basin GSP was approved by DWR in 2023. The analysis focuses on whether the proposed Plan would impede sustainable management of a groundwater basin or impede or obstruct implementation of the Upper San Luis Rey Valley GSP and the San Pasqual Valley Groundwater Basin GSP. For the Borrego Springs Groundwater Subbasin GSP and adjudication, the analysis focuses on whether the proposed Plan would conflict with the project and management actions identified in the GSP to achieve the GSP's sustainability goal with Plan implementation.

In addition, the analysis addresses increased use of groundwater and changes to groundwater recharge under the proposed Plan relative to the existing conditions, as described in the GSPs. Groundwater use typically increases during dry years and decreases in wet years when surface water supplies are more available. Projected groundwater supply yield identified in the SDCWA 2020 UWMP ranges from a low of 25,950 af in 2020 to a high of 31,500 af in 2035. No groundwater availability projections are available for 2050. The analysis provides a

qualitative discussion on how forecasted regional growth and land use change could interfere with groundwater recharge by creating additional impervious surfaces. Forecasted regional growth and land use change would also create additional demands for water supplies from local water supply agencies, a portion of which may be provided by groundwater; the analysis addresses these impacts as well.

In the analysis below, general discussion is provided to describe the proximity of planned transportation network improvements to documented groundwater resources and to determine whether these improvements would impede sustainable groundwater management or conflict with or obstruct implementation of the Upper San Luis Rey Valley GSP, the San Pasqual Valley Groundwater Basin GSP, or the Borrego Springs Groundwater Subbasin GSP. Transportation may increase impervious surfaces but would have very limited demands for water supplies; therefore, their water demands would not substantially affect groundwater resources such that they would result create groundwater overdraft conditions. With regard to groundwater recharge, many of the proposed transportation network improvements are on or adjacent to existing highways, streets, and roads, in which most of the surfaces are already paved or impervious. The analysis nevertheless evaluates how the proposed Plan could result in the implementation of new r network improvements dispersed throughout the Plan area. These new impervious surfaces, while planned for by local implementing agencies, could contribute to limiting regional groundwater recharge if they would substantially decrease groundwater supplies or substantially limit recharge in the areas of new impervious surfaces.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Groundwater basins in San Diego County occur both within the SDCWA service area and in the eastern two-thirds of the county that is entirely dependent on groundwater for all water uses. The population of the portion of the county outside of the SDCWA service area was approximately 111,770 in 2022. This population is forecasted to be approximately 112,558 in 2035 and 109,841 in 2050. The County of San Diego 2011 General Plan Update EIR Appendix D (County of San Diego 2010a) presented the groundwater impacts of forecasted growth and land use change within groundwater-dependent areas overlying fractured-rock aquifers in the unincorporated county. All fractured-rock aquifers and groundwater basins outside of the SDCWA service area were evaluated. Groundwater-level data from a preceding 34-year period was analyzed. The analysis used County of San Diego significance criteria and determined that a significant impact existed if, for at least 1 month during the period of analysis, the groundwater levels in the aquifers were reduced to or below 50% of the overall storage capacity of the groundwater basin or aquifer. The analysis found that 10 groundwater basins or aquifers had minimum storage levels below 50% under preexisting or existing conditions. These groundwater basins or aquifers were also below the 50% storage threshold under 2011 General Plan buildout conditions. When the 2011 General Plan land use buildout conditions were modelled across the eastern two-thirds of the county, an additional 13 groundwater basins or aquifers were found to fall below the 50% storage threshold. The county groundwater study also concluded that in several areas under both existing and future conditions, groundwater supply issues were caused by a concentration of wells in a limited area. Any regional growth occurring between 2022 and 2035 within the boundaries of the 10 identified groundwater basins or aquifers with existing insufficient groundwater storage or within the boundaries of the additional 13 groundwater basins or aquifers identified as having insufficient storage under 2011 General Plan buildout conditions would create a significant groundwater impact.

After the passage of the SGMA, DWR assessed the groundwater basins in the state. DWR classified the groundwater basins as high, medium, or low priority based on groundwater storage and overdraft conditions. The SGMA requires medium- and high-priority basins to form GSAs, develop GSPs, and manage groundwater for long-term sustainability. Two groundwater basins are designated as medium priority consistent with the SGMA in the Plan area: the San Pasqual Valley Groundwater Basin and the Upper San Luis Rey Valley Groundwater Subbasin. The San Pasqual Valley Groundwater Basin GSP was approved by DWR in 2023 (DWR 2023a). The Upper San Luis Rey Valley GSP was approved by DWR in 2024 (DWR 2024). An additional groundwater subbasin, the Borrego Springs Groundwater Subbasin (discussed below), was determined to be high priority due to "critical overdraft" conditions.

The San Pasqual Valley Groundwater Basin GSP indicates that groundwater use in the basin is currently sustainable and no projects or management actions are needed to achieve sustainability (Woodard & Curran 2021). The GSP sustainability goal is "to maintain a locally managed, economically viable, sustainable groundwater resource for existing and future beneficial use in the San Pasqual Valley Groundwater Basin by managing groundwater to avoid the occurrence of undesirable results" (Woodard & Curran 2021). The GSP requires the GSA to continue ongoing existing monitoring programs to assess groundwater levels and identify projects and management actions to be implemented if undesirable results occur.[3]

The sustainability goal for the Upper San Luis Rey Valley Groundwater Subbasin is "to manage and preserve its groundwater resource as a sustainable water supply" (Geoscience 2022). The sustainable yield for the Upper San Luis Rey Valley Subbasin was estimated based on the amount of groundwater pumping and groundwater storage. The estimated current (from 2016 to 2020) sustainable yield of the subbasin is 20,300 afy. The sustainable yield is estimated to be 13,600 afy from 2022 to 2081 if water use and land use pattern continues into the future. The sustainable yield would be refined as additional information about groundwater pumping and groundwater storage is collected during GSP implementation (Geoscience 2022). As discussed in the Upper San Luis Rey Valley GSP, the subbasin is generally operating sustainably within current water demand and water supply conditions. The GSP identifies projects and management actions that support the efficient use of groundwater resources and increase groundwater recharge to help the subbasin remain sustainable through normal and drought hydrologic conditions (Geoscience 2022).

The Borrego Springs Groundwater Subbasin is designated by DWR as high priority and critically overdrafted (BVGSA 2019). Groundwater use within the subbasin would be subject to Watermaster approval. Under the terms of the Settlement Agreement, all parcels within BWD will henceforth be metered by BWD to measure water use. All users will be required to reduce groundwater withdrawals by 5% each year. By 2030, all users will have halved their baseline amounts, and by 2040, groundwater and withdrawal will be reduced by 75%. From that time forward groundwater withdrawal will match basin recharge (see *Borrego Water District v. All Persons who Claim a Right to Extract Groundwater in the Borrego Valley Groundwater Subbasin etc.* groundwater adjudication). The adjudication of the Borrego Springs Groundwater Subbasin provides a regulatory framework for allowing some new development within the BWD service area. New development, and the Borrego Springs Groundwater Subbasin's portion of forecasted regional growth, would occur only after the proposed new development has purchased preexisting water rights. These purchased preexisting rights would be in sufficient quantity to provide for the required future reductions in allowed groundwater withdrawal.

Any forecasted regional growth that occurs within the boundaries of the San Pasqual Valley and Upper San Luis Rey Valley basins would be subject to the approved San Pasqual Valley Groundwater Basin GSP and Upper San Luis Rey Valley GSP, respectively. Portions of the Upper San Luis Rey Valley Groundwater Subbasin are outside the management of a GSA and are not subject to an alternative to GSP or other exemption from SGMA requirements(SWRCB 2025a). Forecasted growth that occurs within the Borrego Springs Groundwater Subbasin would be subject to the terms of the adjudication. Therefore, water used by the forecasted regional growth would be required to comply with the terms of the GSPs and the adjudication and would therefore not interfere with the

[3] Undesirable results are conditions under which each applicable sustainable indicator (e.g., chronic lowering of groundwater levers, significant and unreasonable reduction of groundwater storage, and significant and unreasonable seawater intrusion) would become significant and unreasonably negative to beneficial uses in the basin.

sustainable management of San Pasqual Valley Groundwater Basin, the Upper San Luis Rey Valley Groundwater Subbasin, and the Borrego Springs Groundwater Subbasin, or the implementation of the San Pasqual Valley Groundwater Basin GSP, the Upper San Luis Rey Valley GSP, or the Borrego Springs Groundwater Subbasin GSP, the terms of which were implemented via the adjudication. To ensure groundwater resources are sustainably managed, SGMA gives SWRCB authority to protect groundwater resources through a process called "state intervention" when local agencies are unable or unwilling to sustainably manage their groundwater basins. Anyone who extracts groundwater within the unmanaged areas of the Upper San Luis Rey Valley Groundwater Subbasin, except de minimis extractors (who pump two afy or less for domestic purposes only), must file a groundwater extraction report and associated fees with SWRCB each year. To end the SWRCB management of the unmanaged areas of the Upper San Luis Rey Valley Groundwater Subbasin, the Upper San Luis Rey Valley GSP will have to demonstrate their ability and willingness to manage groundwater sustainably and address the issues that caused state intervention to occur (SWRCB 2025b). Although portions of the Upper San Luis Rey Valley Groundwater Subbasin are outside the management of a GSA, these unmanaged areas are under state intervention to monitor groundwater extraction status of the basin.

Dewatering could occur in areas with high water tables during construction activities associated with future development. However, dewatering would be short term and temporary and would not substantially decrease groundwater supplies. Regional growth and land development would occur on land overlying groundwater basins and rural aquifers outside of the SDCWA service area that were identified by the County of San Diego (2010b) as currently having an insufficient level of aquifer storage to ensure sustainability or were projected to have unsustainable storage levels with the 2011 General Plan buildout. As discussed above, 23 groundwater basins or aquifers were found to have insufficient level of aquifer storage under existing and 2011 General Plan buildout conditions. Although future growth would not interfere with implementation of a GSP, growth would exacerbate current unsustainable conditions of the 23 basins identified in the 2011 General Plan EIR and would cause a significant groundwater impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

As discussed above, in the state of California, methods of accommodating storm water in new transportation improvements financed all or in part with state or federal funds are governed by Caltrans design standards outlined in the Caltrans' Statewide Stormwater Management Plan. Caltrans standards also typically serve as the basis for municipal designs because the municipalities operate under similar NPDES permit requirements. Caltrans storm water management design principles related to transportation improvements are discussed in additional detail above (Caltrans 2016).Temporary BMPs are deployed to retain storm water during project construction. Permanent BMPs encompassing the Caltrans design principles would be incorporated into the permanent design of new transportation improvements. For 1 acre or greater new impervious area, permanent storm water detention and treatment facilities are required by Caltrans' Statewide Stormwater Management Plan to be sized to accommodate 85% of the runoff from a typical 24-hour storm event, which is referred to as a "design event" (Caltrans 2016). In the San Diego region, the design event is determined based on subregional rainfall contour mapping (County of San Diego 2020). Permanent BMPs are typically earthen basins or swales that allow detained runoff to infiltrate the soil and ultimately the underlying groundwater basin. Construction activities associated with transportation network improvements may require dewatering during construction activities. However, dewatering would be short term and temporary and would not substantially decrease groundwater supplies.

When new transportation improvements are constructed, the 85% detention requirement is applicable to the entire facility. When the transportation improvement is a redevelopment or an expansion of an existing facility, the impervious area detention requirements vary dependent upon the area of the new improvement. For highway projects of less than 1 acre and nonhighway transportation projects of less than 5,000 square feet, only the redeveloped area and the hydraulically inseparable flow must be detained. For projects larger than these thresholds, the entire impervious surface within the project limits must be detained and treated (Caltrans 2016). Comply with these requirements would ensure that storm water runoff resulting from transportation network improvements would be detained, which would allow runoff to infiltrate into the ground for groundwater recharge. Therefore, implementation of the transportation network improvements would not interfere substantially with groundwater recharge or groundwater sustainable management.

Transportation network improvements constructed between 2022 and 2035 on land overlying groundwater basins would consist primarily of active transportation network and Complete Corridor improvements. Active transportation network improvements would primarily focus on bikeway development, as shown in Figure 2-7 in Chapter 2, "Project Description." These improvements would cross land overlying the Coastal Plain of San Diego, Mission Valley, San Diego River Valley, San Dieguito Creek, and Santa Maria Vally Groundwater Basins. Complete Corridor improvements, shown in Figure 2-10, would cross land overlying Coastal Plain of San Diego, Mission Valley, San Diego River Valley, San Dieguito Creek, Upper San Luis Rey Valley, San Marcos Area, Santa Maria Vally, Upper San Luis Rey Valley, El Cajon Valley, and Escondido Valley Groundwater Basins. In addition, rail line improvements would occur through 2035, as summarized in Chapter 2, "Project Description," Table 2-7 in Central County Subregion. Rail line improvements would occur on land overlaying Coastal Plain of San Diego, El Cajon Valley, Escondido Valley, Mission Valley, San Diego River Valley, San Dieguito Creek, and San Marcos Area Groundwater Basins. None of these groundwater basins were determined to be of medium or high priority by DWR due to overdraft conditions except the Upper San Luis Rey Valley Groundwater Subbasin (a medium-priority basin). Transportation network improvements would be required to comply with the requirement of the Upper San Luis Rey Valley GSP to ensure sustainable management of groundwater. Although the Escondido Valley Groundwater Basin is not a medium or high priority basin determined by DWR, it was determined to have inadequate storage capacity under 2011 General Plan buildout conditions. Transportation network improvements occur on land overlying the Escondido Valley Groundwater Basin would be required to comply with the detention requirements discussed above to retain and infiltrate stormwater so that groundwater recharge would not be interfered.

All new or expanded transportation network improvements developed between 2022 and 2035 would be required by Caltrans design standards outlined in Caltrans' Statewide Stormwater Management Plan described above to detain storm water runoff from newly created impervious surfaces. Specifically, storm water runoff equivalent to 85% of that generated by a design storm event would be detained in storm water detention and treatment facilities and allowed to infiltrate the subsoil. This storm water detention and infiltration would allow runoff infiltration to groundwater and increase the potential for groundwater recharge. Complying with the exiting requirements would prevent any significant impacts on underlying groundwater basins or on groundwater sustainability. The groundwater impact would be less than significant.

2035 Conclusion

Transportation network improvements would have sufficient storm water detention facilities to prevent significant impacts on groundwater supplies or groundwater basin sustainability. The impact associated with transportation network improvements would be less than significant. However, regional growth and land use change between 2022 and 2035 could occur on land overlying basins that were identified by the county (County of San Diego 2010a) as currently having an insufficient level of aquifer storage to ensure sustainability or were projected to have unsustainable storage levels with 2011 General Plan buildout. Regional growth and land use change would, therefore, result in significant impacts on the groundwater supplies in basins and on groundwater basin sustainability in the year 2035. Therefore, this impact (WS-2) in the year 2035 is significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. While there is a decrease in population forecasted, there would be an increase in housing units that may occur within the boundaries of the San Pasqual Valley and Upper San Luis Rey Valley basins, which have been designated as medium-priority groundwater basins by DWR. Dewatering could occur in areas with high water tables during construction activities associated with future development. However, dewatering would be short term and temporary and would not substantially decrease groundwater supplies. Future development that crosses land overlaying these groundwater basins would be subject to the approved San Pasqual Valley Groundwater Basin GSP and Upper San Luis Rey Valley GSP to ensure sustainable use of groundwater. Growth that crosses land overlaying the Upper San Luis Rey Valley Groundwater Subbasin unmanaged areas would be required to file groundwater extraction reports and associated fees with SWRCB each year for groundwater level monitoring. Forecasted growth that occurs in the Borrego Springs Groundwater Subbasin would be subject to the terms of the adjudication. Therefore, the potential water usage increase in these groundwater basins would not contribute to a significant impact through compliance with the approved GSPs and the adjudication.

Regional growth and land use change between 2036 and 2050 would continue to occur on land overlying groundwater basins. Outside the SDCWA service area, growth would occur on land overlying rural groundwater aquifers identified by the county as currently having an insufficient level of storage to ensure sustainability or were projected to have unsustainable storage levels with 2011 General Plan buildout. As discussed above, 23 groundwater basins or aquifers were found to have insufficient level of aquifer storage under existing and 2011 General Plan buildout conditions, such as the Escondido Valley and Poway Valley Groundwater Basins (County of San Diego 2010a). Because the underlying aquifers for these basins are being used at an unsustainable level, growth would exacerbate the current unsustainable condition characterizing these aquifers and would cause a significant groundwater impact.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Transportation network improvements constructed on land overlying groundwater basins between 2036 and 2050 would consist of active transportation, highway, and rail improvements. Active transportation improvements would consist of primarily bikeway development as shown in Figure 2-8 of Chapter 2, "Project Description," which would occur on land overlying the Coastal Plain of San Diego, Escondido Valley, Mission Valley, San Diego River Valley, San Dieguito Creek, Upper San Luis Rey Valley, San Mateo Valley, and San Onofre Valley Groundwater Basins. Complete Corridor improvements would occur along various highways (e.g., I-5, I-15, and SR 125), as shown in Figure 2-13. Complete Corridor improvements would occur on land overlaying Batiquitos Lagoon Valley, Coastal Plain of San Diego, El Cajon Valley, Escondido Valley, Mission Valley, San Diego River Valley, San Dieguito Creek, Upper San Luis Rey Valley, San Marcos Area, and Santa Maria Valley Groundwater Basins. Rail improvements would occur from 2035 to 2050, as summarized in Table 2-10 of Chapter 2, "Project Description." These improvements would occur on land overlying the Coastal Plain of San Diego, El Cajon Valley, Escondido Valley, Mission Valley, San Diego River Valley, San Dieguito Creek, Upper San Luis Rey Valley, and San Marcos Area Groundwater Basins. The Upper San Luis Rey River Groundwater Basin was determined to be of medium priority by DWR due to overdraft conditions. Implementation of transportation network improvements would be required

to comply with the requirement of the Upper San Luis Rey Valley GSP to ensure sustainable management of groundwater. Dewatering could occur in areas with high water tables during construction activities associated with transportation network improvements. However, dewatering would be short term and temporary and would not substantially decrease groundwater supplies. Although the Escondido Valley Groundwater Basin is not a medium or high priority basin determined by DWR, it was determined to have inadequate storage capacity under 2011 General Plan buildout conditions. Transportation network improvements occur on land overlying the Escondido Valley Groundwater Basin would be required to comply with the detention requirements discussed under the "2035" analysis to retain and infiltrate stormwater so that groundwater recharge would not be interfered.

All new or expanded transportation network improvements developed between 2036 and 2050 would be required to detain storm water runoff from newly created impervious services. Storm water runoff equivalent to 85% of that generated by a design storm event would be detained in earthen basins or swales and allowed to infiltrate the subsoil. This storm water detention and infiltration would be sufficient to prevent any significant impacts on underlying groundwater basins or on groundwater sustainability. The groundwater impact would be less than significant.

2050 Conclusion

Transportation network improvements would have sufficient storm water detention facilities to prevent significant impacts on groundwater supplies or groundwater basin sustainability. The impact associated with transportation network improvements would be less than significant. However, between 2036 and 2050, regional growth and land use change would have the potential to occur on land overlying 23 basins (e.g., the Escondido Valley and Poway Valley Groundwater Basins) that have been identified by the county as having inadequate storage and would have inadequate storage under the 2011 General Plan buildout conditions. Regional growth and land use change would therefore result in significant impacts on the groundwater supplies in basins and on groundwater basin sustainability in the year 2050. Therefore, this impact (WS-2) in the year 2050 is significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change and transportation network improvements could decrease groundwater supplies or interfere with groundwater recharge, impeding sustainable groundwater management. Climate change could directly affect groundwater supplies through saltwater intrusion, which contaminates potable groundwater along the coast (DWR 2025; SDCWA 2025c; Cole et al. 2024). Decreases in imported water and surface water from climate change could also affect groundwater, as decreases in other supplies result more groundwater withdrawals (Cole et al. 2024).

The proposed Plan's impacts would be worsened by climate change. The proposed Plan would increase population in the San Diego region, further increasing demand for groundwater, which is expected to be increasingly scarce with climate change. Furthermore, development for the proposed Plan would increase the extent of impervious surfaces, which could impede groundwater recharge (Bedsworth et al. 2018), decreasing the potential for more groundwater supplies in the future.

MITIGATION MEASURES

WS-2 SUBSTANTIALLY DECREASE GROUNDWATER SUPPLIES OR INTERFERE SUBSTANTIALLY WITH GROUNDWATER RECHARGE SUCH THAT THE PROPOSED PLAN WOULD IMPEDE SUSTAINABLE MANAGEMENT OF GROUNDWATER BASINS OR OBSTRUCT IMPLEMENTATION OF A SUSTAINABLE GROUNDWATER MANAGEMENT PLAN

2035 and 2050

Implement WS-1a and WS-1b described above.

WS-2 Implement Groundwater Measures to Ensure Sustainable Yield for Development Projects.
The County of San Diego, cities, and other local jurisdictions can and should ensure sustainable yield of groundwater basins during planning, design, and project-level CEQA review of development projects, by taking measures consisting of, but not limited to, the following:

- Participate in a groundwater-trading program to enable permanent transfer and potentially long-term and short-term lease of baseline-pumping allocations to allow groundwater users or new development to purchase needed groundwater allocation from others.
- Ensure that projects requiring continual dewatering facilities implement monitoring systems and long-term administrative procedures to ensure proper water management that prevents degrading of surface water and minimize, to the greatest extent possible, adverse impacts on groundwater for the life of the project. Comply with appropriate building codes and standard practices including the Uniform Building Code.
- Maximize, where practical and feasible, permeable surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. Minimize new impervious surfaces to the greatest extent possible, including the use of in-lieu fees and off site mitigation.
- Avoid designs that require continual dewatering where feasible. Where feasible, do not site transportation facilities in groundwater recharge areas to prevent conversion of those areas to impervious surface.

SIGNIFICANCE AFTER MITIGATION

2035 and 2050

Implementation of the proposed Plan would have the potential for increased population in areas overlying rural groundwater basins that have or are anticipated to have insufficient storage based on existing and projected groundwater withdrawals. The increase of population would impede groundwater basin sustainability. Forecasted growth and land use change would result in population increases in areas overlying the San Pasqual Valley, Upper San Luis Rey Valley, and Borrego Springs Groundwater Basins. These groundwater basins have been designated as medium or high priority by DWR due to overdraft conditions. Future development in these groundwater basins would be required to comply with the San Pasqual Valley Groundwater Basin GSP, the Upper San Luis Rey Valley GSP, and the Borrego Springs Groundwater Subbasin GSP, the terms of which were implemented via the adjudication. Compliance with the approved GSPs would ensure the sustainable use of groundwater in the San Pasqual Valley, Upper San Luis Rey Valley, and Borrego Springs Groundwater Basins.

However, regional growth and land development would occur on land overlying 23 groundwater basins and rural aquifers that were identified by the County of San Diego (2010b) as having an insufficient level of storage and would have insufficient storage under the 2011 General Plan buildout conditions. Future development in the boundaries of these groundwater basins would impede groundwater basin sustainability. Because it cannot be guaranteed that all future project-level groundwater impacts can be mitigated to a less-than-significant level, this impact (WS-2) would remain significant and unavoidable.

WS-3 REQUIRE OR RESULT IN THE RELOCATION OR CONSTRUCTION OF NEW OR EXPANDED WATER FACILITIES, THE CONSTRUCTION OR RELOCATION OF WHICH COULD CAUSE SIGNIFICANT ENVIRONMENTAL EFFECTS.

Analysis Methodology

This analysis provides information on the adequacy of existing water facilities to serve forecasted regional growth and land use change and proposed transportation network improvements. Water facilities are defined to include conveyance (of raw water), storage, treatment, and distribution facilities. Major water conveyance systems serving the region include the California Aqueduct and Colorado River Aqueduct, and the system includes other conveyance pipelines and associated infrastructure. A significant impact would occur if forecasted regional growth

and land use change or transportation network improvements and programs required construction, expansion, or relocation of water facilities that would result in significant physical impacts.

To evaluate potential impacts, areas where growth and land use change or transportation network improvements and programs are expected to occur are compared to the existing capacity of water supply facilities identified in Section 4.18.1, "Existing Conditions," to determine whether implementation of the proposed Plan would require the construction of new or expanded water supply facilities in order to maintain water supply. Impacts of construction activities for new or expanded facilities are analyzed as well. Because the timeframe analyzed extends to 2050, precise impact assessment is difficult due to uncertainty associated with the timing, location, and project-specific information. SDCWA's in-region storage includes the Olivenhain Reservoir, the San Vicente Reservoir, and Lake Hodges. Water treatment for almost all retail water service within the Project area is provided by an SDCWA member agency WTP, Twin Oaks Valley WTP, or MWD's Skinner WTP. This regionally treated water capacity provides flexible and robust local water treatment options and supports member agencies' constructed facilities.

Water demands associated with the proposed Plan's regional growth and land use change or transportation network improvements are discussed and then compared to the existing capacity of water facilities. A shortfall in capacity compared to future water demands would result in the need to construct additional facilities, resulting in new impacts.

The potential short- and long-term physical impacts of constructing and operating such facilities are described. Several existing water infrastructure projects and expansions are identified in the SDCWA 2024 Master Plan to meet current and projected regional water demand. Specific major infrastructure plans and projects proposed by the local water supply agencies are described, along with a general assessment of potential impacts that would occur.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Water usage within the SDCWA service area in 2020 was 463,128 af, and the forecasted demand for 2035 is 671,509 af (SDCWA 2021a). This represents an increase of 208,381 af. The SDCWA water supply infrastructure as identified in Table 4,18-9 would have sufficient capacity (722,793 af) to storage water to meet the forecasted water demand. However, the 2024 Master Plan indicates that delivery reliability is vulnerable during local seismic events (SDCWA 2025a). Infrastructure improvements and operational strategies associated with water delivery would be required to reduce risk and ensure system reliability 45.

The following projects have been identified in the 2024 Master Plan to be considered for implementation within the next 10 years through 2035 (SDCWA 2025a):

- **Pipeline 3/Pipeline 4 Conversion:** The project would involve relining of Pipeline 4 by enabling Pipeline 3 to operate as an alternative treated water transmission pipeline, allowing Pipeline 4 to be taken out of service during the rehabilitation process. The project would consist of the construction of interconnection facilities between Pipelines 3 and 4 that would allow either pipeline to convey treated or untreated water north of the Twin Oaks Valley WTP.

- **Additional Pump Drive and Transformer at the San Vicente Pump Station (SVPS):** The project would involve installation of an additional pump drive and transformer at SVPS to provide increased redundancy of pumps, eliminating the current vulnerability in the event of a mechanical failure of one or more station components.
- **Crossover Pipeline Rehabilitation Optimization:** The project would include rehabilitation of the Crossover Pipeline using structural lining technologies facilitated by the implementation of temporary provisions to provide alternative treated water supplies to member agencies impacted during the rehabilitation process, which would require extended shutdowns of the Crossover Pipeline. This project has been developed to mitigate risk and as a cost-saving alternative to the currently planned Crossover Pipeline Replacement project.
- **Aqueduct Isolation Facilities:** The project would consist of the construction of isolation facilities at pipeline locations at high risk of failure due to seismic or flooding events that would allow SDCWA to quickly reoperate the aqueduct system to provide continued deliveries during pipeline repair activities.
- **Rejection Tower Replacement:** The Second Aqueduct Rejection Tower serves as a critical hydraulic control facility, necessary to supply untreated water to the Twin Oaks Valley WTP and Crossover Pipelines. The aging facility is exhibiting corrosion that poses a risk of structural degradation. The project would replace the Rejection Tower with a new, seismically resistant structure.
- **Additional Power Source at SVPS:** The project would consist of installation of on-site backup power generation to provide redundancy at SVPS during commercial power outages.

Implementation of water facility improvements would result in short-term construction-related impacts. Construction-related impacts are typically controllable and can be mitigated below a level of significance through actions of the implementing agency, including adherence to existing regulations and BMPs. Additionally, the operation of new facilities may lead to long-term environmental impacts, such as those related to air quality and noise. Because details about the timing, location, and project-specific information for new water facilities are not known, there is no assurance the impacts from the construction or operation of new or expanded water facilities would be less than significant. Therefore, this impact is significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Transportation network improvements and programs are developed to accommodate the projected growth and increases in population, housing, and employment. New treatment and storage facilities would not be required to provide water for irrigated landscaping on proposed Plan transportation projects because the water demands of these projects are relatively minor.

New transportation network improvements with landscaping areas would require irrigation. For areas that existing irrigation infrastructure does not exist, new or extended distribution pipelines would be needed to extend the recycled water service for irrigation. The construction of new roadways, bicycle and pedestrian facilities, and transit facilities, and operation and maintenance of new facilities would require the use of water for construction activities, such as concrete mixing and dust control, and for operations activities and services, such as restrooms and drinking fountains. Implementation of these projects in rural areas (e.g., in the eastern part of San Diego County), where existing water transmission infrastructure is not available, could require construction or expanded water distribution facilities.

Construction and operation of recycled water distribution facilities and new or expanded water distribution facilities would result in short-term construction-related impacts. Construction-related impacts are typically controllable and can be mitigated below a level of significance through actions of the implementing agency, including adherence to existing regulations and BMPs. Additionally, the operation of new facilities may lead to long-term environmental impacts such as those related to air quality, noise, and traffic. Because details about the timing, location, and project-specific information for new water facilities are not known, there is no assurance the impacts from the construction or operation of new or expanded water facilities would be less than significant. Therefore, the impact would be significant.

2035 Conclusion

Regional growth and land use change and transportation network improvements under the proposed Plan would result in the construction of new or expanded water facilities. The impact of constructing some of these facilities would be significant. Therefore, this impact (WS-3) in the year 2035 is significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050. As noted above, the forecasted normal year water demand in 2035 is 598,474 af (Table 4.18-12). The estimated normal year demand for 2050 is 578,043 af, a decrease of 20,431 af. Therefore, it is not anticipated that new facilities or expansion of existing water facilities would be needed to serve the projected growth. However, some uncertainty exists for 2050 water supplies during a single dry year and multiple dry years in the region as discussed in Impact WS-1. This uncertainty exists because the SDCWA's and MWD's UWMPs (SDCWA 2021a; MWD 2021) have a planning horizon of 2045, and the most recent SDCWA 2024 Master Plan (SDCWA 2025a). Because there may be insufficient regional water supplies to meet regional water demand in 2050 in the event of a dry year or multiple dry years, there would be potential for the construction and operation of new facilities, such as water storage and recycled water facilities, to meet the 2050 water demand. Construction-related impacts are typically controllable and can be mitigated below a level of significance through actions of the implementing agency, including adherence to existing regulations and BMPs. Additionally, the operation of new facilities may lead to long-term environmental impacts, such as those related to air quality, noise, and traffic. Because details about the timing, location, and project-specific information for new water facilities are not known, there is no assurance the impacts from the construction or operation of new or expanded water facilities would be less than significant. Therefore, the impact would be significant.

Transportation Network Improvements and Programs

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

By 2050, most of the transportation network improvements and programs associated with the proposed Plan would be in place and operational. The availability of water facilities to serve the water demand in 2050 in the

event of a dry year or multiple dry years is uncertain. In some locations, new distribution pipelines would be needed to extend recycled water service to new projects where such service is not available, and their construction and operation would cause environmental impacts. Construction-related impacts are typically controllable and can be mitigated below a level of significance through actions of the implementing agency, including adherence to existing regulations and BMPs. Additionally, the operation of new facilities may lead to long-term environmental impacts such as those related to air quality and noise. Because details about the timing, location, and project-specific information for new water facilities are not known, there is no assurance the impacts from the construction or operation of new or expanded water facilities would always be less than significant. Therefore, the impact would be significant.

2050 Conclusion

Implementation of regional growth and land use change and transportation network improvements and programs would result in the construction of new or expanded water facilities. The impact of constructing some of these facilities would likely be significant. Therefore, this impact (WS-3) in the year 2050 is significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change and transportation network improvements would result in potential relocation or construction of new or expanded water facilities. Climate change impacts that decrease water supplies, such as reduced precipitation, increased drought and evapotranspiration, and changes in snowpack melt timing (CEP and SDF 2015), may require construction of new water facilities in the future, such as reservoirs or treatment plants. Additionally, climate change impacts such as increased occurrence and unpredictability of wildfire and flooding could damage water facilities, requiring upgrades or new facilities to replace them. The proposed Plan's impacts would be worsened by climate change.

MITIGATION MEASURES

WS-3 REQUIRE OR RESULT IN THE RELOCATION OR CONSTRUCTION OF NEW OR EXPANDED WATER FACILITIES, THE CONSTRUCTION OR RELOCATION OF WHICH COULD CAUSE SIGNIFICANT ENVIRONMENTAL EFFECTS.

2035 and 2050

Implement Mitigation Measures WS-1a, WS-1b, and WS-2, described above.

WS-3 Implement Measures for New or Expanded Water Facilities.

During planning, design, and project-level CEQA review of development projects and water projects, MWD, SDCWA, the County of San Diego, cities, and other local jurisdictions can and should apply necessary mitigation measures to avoid or reduce significant environmental impacts associated with the construction or expansion of new or expanded water facilities. Mitigation measures should be implemented by the water management agencies directly responsible for the construction of new or expanded water facilities. Significant environmental impacts requiring mitigation may consist of but are not limited to air quality, noise, traffic, biological resources, cultural resources, paleontological resources, tribal cultural resources, energy, greenhouse gas emissions, hydrology and water quality, and water supply.

SIGNIFICANCE AFTER MITIGATION

2035 and 2050

Implementation of the proposed Plan through 2035 would result in significant impacts associated with the construction or expansion of water facilities. Mitigation Measures WS-1a, WS-1b, WS-1c, and WS-2, would reduce the impacts of project-specific construction or expansion of water facilities through reducing water demands, and through project-level planning, design, and CEQA mitigation measures. Mitigation Measure WS-3 would require project-specific mitigation to be implemented for new or expanded water facilities. Because the details about the

timing, location, and project-specific information for new and expanded water facilities are not known, it cannot be guaranteed that future project-level impacts can be mitigated to a less-than-significant level by Mitigation Measure WS-3.

Implementation of the proposed Plan from 2036 through 2050 would result in decreased water demand during normal years. However, the availability of water facilities to serve the water demand in 2050 in the event of a dry year or multiple dry years is uncertain. Implement of the proposed Plan from 2036 through 2050 may require construction of water storage and recycled water facility to meet the 2050 water demand. Construction activities would result in significant impacts. Implementation of Mitigation Measures WS-1a, WS-1b, WS-1c, WS-2, and WS-3 would reduce the impacts of project-specific construction or expansion of water facilities through project-level planning, design, and CEQA mitigation measures. However, it cannot be guaranteed that future project-level impacts can be mitigated to less-than-significant level due to uncertainty related to the timing, location, and project-specific information of the new or expanded water facilities.

As discussed above, this impact (WS-3) would remain significant and unavoidable.

4.18.5 Cumulative Impacts Analysis

C-WS-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS TO WATER SUPPLY

The geographic scope for the water supply cumulative analysis is the state of California, the Lower Colorado River Basin, and Northern Baja California. The large geographic scope is appropriate because growth in these areas would have the potential to increase water demand in the region in a manner that exceeds existing entitlements and recourse, which would influence water supply to meet the demand of the proposed Plan.

The projection approach is used in the cumulative analysis of water supply. A projection approach uses growth projections contained in other adopted plans and/or environmental documents in the cumulative geographic scope to determine if existing water supplies and facilities are adequate to meet projected regional demand or if general patterns of regional urbanization, growth, and land use changes and infrastructure development would result in the need for new or expanded water treatment and distribution facilities.

The plans and studies relied on and considered for the cumulative analysis include the SCAG 2024-2050 RTP/SCS and EIR (SCAG 2024a, 2024b); the SDCWA 2024 Master Plan (SDCWA 2025a); Water Supply for Baja California: Economic – Engineering Analysis for Agricultural, Environmental, and Urban Demands (Medellin-Azuara et al. 2009); California Water Action Plan (CNRA 2014); California Water Plan 2023 Update (DWR 2023b); SDCWA's 2020 Urban Water Management Plan (SDCWA 2021a); MWD's 2020 Urban Water Management Plan (MWD 2021); Municipal Water District of Orange County's (MWDOC) 2020 Urban Water Management Plan (MWDOC 2021); Imperial Irrigation District's 2012 Integrated Regional Water Management Plan (IID 2012); 2034 Tijuana, Tecate, and Playas de Rosarito Metropolitan Strategic Plan (IMPLAN 2013); Colorado River Basin Water Supply and Demand Study (Bureau of Reclamation 2012); and Lower Colorado River Interim Shortage Criteria and associated EIS (Bureau of Reclamation 2007). Although many of these documents do not have accompanying environmental analysis, they provide valuable information regarding the current and future status of water supply throughout the cumulative region.

Within the geographic scope of the analysis are two groundwater basins designated by DWR as medium priority and one basin designated as high priority consistent with the SGMA. The GSPs for the medium-priority basins to allow future maintenance of a sustainable yield from these basins and have been approved by DWR. A GSP has been prepared for the high-priority basin, the Borrego Springs Groundwater Subbasin, by BVGSA. The Borrego Springs Groundwater Subbasin GSP establishes a sustainability goal to halt the overdraft condition in the subbasin by bringing the groundwater demand in line with a sustainable yield of 5,700 afy by 2040 (BVGSA 2019). A settlement agreement to adjudicate groundwater rights in a manner consistent with the GSP was approved on April 8, 2021. (See *Borrego Water District v. All Persons who Claim a Right to Extract Groundwater in the Borrego Valley Groundwater Subbasin No. 7.024-01*) [Superior Court of the State of California, County of Orange 2021].)

In its most recent general plan update (County of San Diego 2011), the County of San Diego examined groundwater basins and fractured-rock aquifers across the county to determine which were being exploited in an unsustainable manner as evidenced by insufficient aquifer storage. The County of San Diego 2011 General Plan Update EIR Appendix D (County of San Diego 2010a) found that 23 groundwater basins or aquifers, had insufficient groundwater storage under preexisting or existing conditions and would have insufficient groundwater storage under 2011 General Plan buildout conditions.

Cumulative impacts on water supply are evaluated in two steps. First, the combined effects of the proposed Plan and adopted plans are considered to determine whether their impacts are collectively (i.e., cumulatively) significant. If the cumulative impact is significant, the proposed Plan's incremental contribution is then assessed to determine whether it is cumulatively considerable, which would be considered a significant cumulative impact associated with the Plan. Specifically, significant cumulative impacts related to water supply would occur if the Plan would result in a considerable contribution to a cumulatively significant.

Impacts of the Proposed Plan

Reasonably foreseeable existing and future regional water supplies would be adequate to meet regional water demands associated with growth and land use change and transportation network improvements in 2035. Beyond 2045, however, adequate water supplies to meet regional needs cannot be confirmed. This uncertainty means that there may be insufficient regional water supplies in 2050, resulting in a significant impact (Impact WS-1). Also, the Proposed Plan would result in localized significant impacts because of regional development and land use changes within the boundaries of groundwater basins that are currently being pumped at unsustainable levels. Impacts associated with groundwater supplies in 2035 and 2050 would be significant (Impact WS-2). Furthermore, forecasted growth and land use change and implementation of transportation network improvements in 2035 and 2050 would require construction of new water facilities or the expansion of existing facilities. The impacts associated with water facilities construction would be significant (Impact WS-3).

Impacts of Projections in Adopted Plans

Although a majority of the documents and plans available for cumulative analysis do not have an associated environmental analysis, they do provide anticipated water supply and demand for the region and consider the adequacy of existing supplies and plans for future supplies to meet future needs. These regional plans also offer resource management strategies and objectives for ensuring future water supply, such as reduce water demand, improve operational efficiencies, increase and diversify water supply, and provide resource stewardship. Due to recent drought conditions throughout the state of California, many water districts and other water suppliers have implemented a variety of drought responses that could influence the availability of water supplies and water deliveries as previously anticipated in local and regional plans.

The SCAG 2024-2050 RTP/SCS EIR (SCAG 2024b) found that the projected growth from the 2024-2050 RTP would contribute to increased water demand and associated water infrastructure. The EIR also identified the potential for the SCAG 2024-2050 RTP/SCS to contribute to cumulatively considerable demand on water resources and water infrastructure. Furthermore, the increased demand resulting from the 2024-2050 RTP's influence on growth could only be partially mitigated via measures beyond the purview of SCAG to implement, meaning that significant and unavoidable water supply impacts would result.

Agricultural operations and population growth in California and Northern Baja California have placed pressure on natural resources, particularly water supply. It is of significant concern to the California–Baja California border, where 50% of the entire United States–Mexico border population lives. The conditions of northern Baja region, consisting of an arid climate, prominent agriculture, fast-growing border cities, and water-sensitive ecosystems, indicate that future water supplies will be a problem (Medellin-Azuara et al. 2009).

The SDCWA 2020 UWMP reports that, for normal years through 2045, no water supply shortages would occur if supplies are developed as planned. Under the parameters assumed in the multiple dry year analysis, no shortages would be experienced. Diversified supplies, consisting of water transfer agreements, local surface water,

desalination, and entitlements to MWD supplies, assure adequate water even during drought cycles through 2045. After 2045, there are no projections (SDCWA 2021a).

The County of San Diego 2011 General Plan Update EIR determined that groundwater basins and fractured-rock aquifers in the county were currently being pumped at levels that resulted in insufficient water level recovery. Such use is unsustainable over time and would be a significant impact to the groundwater resources.

The 2024 SDCWA Master Plan identifies that the existing infrastructure and water supplies are anticipated to meet future demand and the Quantification Settlement storage is adequate. However, delivery reliability is vulnerable during local seismic events (SDCWA 2025a). The environmental document for the 2024 Master Plan (SDCWA 2025a) determined that the 2024 Master Plan projects may require small volumes of water to support construction-related activities, including dust suppression. Existing water supplies are adequate to support these limited project needs. Long-term operations of these facilities would maintain regional water supply and would not create any new water demands (SDCWA 2025b).

The MWD 2020 UWMP reports that MWD has supply capabilities that would be sufficient to meet projected demands from 2020 through 2045 under the single dry year and multiple dry year conditions (MWD 2021). There are no projections post-2045.

The MWDOC 2020 UWMP concludes that the MWDOC service area (the region served by MWDOC is in Orange County and includes 26 cities and water districts) will have sufficient existing and planned supplies to meet full service demands under every water year hydrologic scenario through 2045 by depending on MWD deliveries to compensate for any local shortfalls. The plan also discusses potential sources of water supply that are being investigated to diversify the region's water supply portfolio, such as water transfers and exchange and ocean water desalination (MWDOC 2021).

The Imperial Irrigation District 2012 Integrated Regional Water Management Plan states that the Imperial Region is faced with significant water resources challenges, most of which relate to the availability of imported water from the Colorado River. System and on-farm efficiency conservation measures have been formulated to enable IID to meet the reduction requirement of net annual consumptive use of Colorado River water of 408,000 af by 2026. These measures are designed to maintain historical levels of agricultural productivity and MCI water supplies; however, when forecasted renewable energy and other demands are added to the future demand, the historical amount would no longer be sufficient (IID 2012).

The 2034 Tijuana, Tecate, and Playas de Rosarito Metropolitan Strategic Plan lists the low water availability in the region as a critical environmental issue, which is a limiting factor for future development. The plan states that water demand in 2025 will be greater than 80% of the available water reserves. Strategies for improvements listed in the plan include promoting investment to ensure capacity of reuse and infiltration of treated water and installing sea water desalination plants (IMPLAN 2013).

The Colorado River Basin Water Supply and Demand Study found that the Colorado River Basin faces a range of potential future imbalances between supply and demand and states that addressing such imbalances will require diligent planning and cannot be resolved through any single approach or option. Instead, an approach that applies a wide variety of ideas at local, state, regional levels, and portfolio exploration demonstrated that implementation of a broad range of options can reduce the basin's resource vulnerability and improve the system's resiliency to dry hydrologic conditions while meeting increasing demands in the basin and adjacent areas receiving Colorado River water (Bureau of Reclamation 2012).

The Lower Colorado River Interim Shortage Criteria and associated EIS (Bureau of Reclamation 2007) represent a plan to share water supply shortages among Lower Colorado River water users, including SDCWA. The EIS prepared for the interim shortage criteria projects Lower Colorado River water supply and demand conditions through 2050. It also analyzes and considers trade-offs between the frequency and magnitude of shortages, and describes potential effects of water shortage in Lake Powell and Lake Mead, and on water supplies, power production, recreation, and other environmental resources. Ongoing drought conditions and the potential for water supply shortages prompted discussions and negotiations focused on how to conserve additional basin

water supplies. The federal government led multiple efforts to improve the basin's water supply outlook, resulting in collaborative agreements in 2003 and 2007 and in the 2019 drought contingency plans (DCPs) for the Upper and Lower Colorado River Basins. The Lower Basin DCP is designed to require Arizona, California, and Nevada to curtail deliveries and thereby contribute additional water to Lake Mead storage at predetermined "trigger" elevations. It is also designed to create additional flexibility to incentivize voluntary conservation of water to be stored in Lake Mead, thereby increasing lake levels (Congressional Research Service 2024).

As described in many of the plans above, often there is an expectation that future water supply could be met given certain parameters, such as proposed water supply projects being constructed and operational, entitlements being fully granted, and water use reduction measures being successful. These factors are highly uncertain and, in some cases, such as rainfall and drought conditions, are uncontrollable by the water agencies, districts, or suppliers.

Cumulative Impacts and Impact Conclusions

2035

A significant cumulative impact in the year 2035 would result if the proposed Plan's incremental effect would be cumulatively considerable when considered along with the effects from adopted plans within the state of California, the Lower Colorado River Basin, and Northern Baja California region.

As described above, significant water supply impacts were not identified for proposed Plan's growth and land use changes and transportation network improvements in 2035. However, the SCAG 2024-2050 RTP/SCS was found to contribute to cumulatively considerable demand on water resources. Although many of the regional water supply planning documents anticipate being able to adequately meet future water demand in the near term, their ability to do so is based on the planned water supply projects being constructed, implementation of conservation measures, and water entitlements being granted. Furthermore, a number of additional indeterminate factors could affect future water supply, including meteorological conditions, climate change, cost and use of energy, potential policy and permitting restrictions, endangered species protections, and demographic unknowns. The proposed plan, together with the regional and statewide plans, would have the potential to increase the demand for water in a manner that exceeds existing entitlements and resources. The combined impacts of these regional and statewide plans, and the proposed Plan's 2035 water supply impacts would be significant regarding increased demands on existing water supplies such that they could be inadequate to serve future demand, and new or expanded water supplies or entitlements would be needed by 2035.

Regional growth and land development would result in population increases on land overlying three groundwater basins (the San Pasqual Valley Groundwater Basin, the Upper San Luis Rey Valley Subbasin, and Borrego Springs Groundwater Subbasin), requiring preparation of GSPs due to their medium- or high-priority designation by DWR. Water agencies would be required to comply with the terms of the San Pasqual Valley Groundwater Basin GSP, the Upper San Luis Rey Valley GSP, and the Borrego Springs Groundwater Subbasin GSP, the terms of which were implemented via the adjudication. However, regional growth and land development would also occur on land overlying groundwater basins identified by the county as having insufficient storage (County of San Diego 2010b). Because groundwater impacts of regional growth and land use change would be significant in the year 2035, they would contribute to a significant cumulative groundwater impact.

Construction of new or expanded facilities would cause short-term construction impacts that are typically controllable through adherence to regulations and BMPs, as well as operations and maintenance impacts. There is no assurance the impact from new or expanded water facilities would be less than significant for all projects. The SCAG 2024-2050 RTP/SCS was also found to contribute to cumulatively considerable demand on associated water supply infrastructure. Thus, the cumulative impact related to construction of new or expanded water treatment or distribution facilities, when added to proposed Plan impacts, would be significant in 2035.

Because water supply impacts throughout the state of California, the Lower Colorado River Basin, and northern Baja region by 2035 would be significant, and because the proposed Plan's incremental water supply impacts are significant, cumulative water supply impacts are significant, and the proposed Plan's incremental water supply impacts are cumulatively considerable and therefore significant Impact C-WS-1).

2050

The cumulative analysis presented above for year 2035 would be applicable to year 2050. In addition, water planning documents prepared by water agencies in the region have no projections for water supplies after 2045. Significant water supply and facility impacts were identified for proposed Plan growth and land use changes, as well as for transportation network improvements in 2050. When considered along with the water supply impacts of regional and statewide plans, the incremental impacts from the proposed Plan would also result in significant cumulative impacts on water supplies in 2050.

Regional growth and land use change between 2036 and 2050 would continue to occur on land overlying three of the groundwater basins designated as medium and high priority by DWR and would be required to comply with the terms of the GSPs and adjudication, reducing potential impacts to groundwater supply. However, regional growth and land use change would also occur on land overlying groundwater basins and fractured-rock aquifers identified by the county as having an insufficient level of aquifer storage to ensure sustainability (County of San Diego 2010b). Forecasted regional growth between 2036 and 2050 would exacerbate the current unsustainable conditions characterizing these aquifers and would cause a significant cumulative groundwater impact.

Construction of new or expanded facilities would cause short-term construction impacts that are typically controllable through adherence to regulations and BMPs, as well as operations and maintenance impacts. There is no assurance the impact from new or expanded water facilities would be less than significant for all projects. The SCAG 2024-2050 RTP/SCS was also found to contribute to cumulatively considerable demand on associated water supply infrastructure. Thus, the cumulative impact related to construction of new or expanded water treatment or distribution facilities, when added to proposed Plan impacts, would be significant in 2050.

Because water supply impacts throughout the state of California, the Lower Colorado River Basin, and northern Baja region by 2050 would be significant, and because the proposed Plan's incremental water supply impacts are significant, cumulative water supply impacts are significant, and the proposed Plan's incremental water supply impacts are also cumulatively considerable and therefore significant. (Impact C-WS-1).

MITIGATION MEASURES

C-WS-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS TO WATER SUPPLY.

Mitigation Measure WS-1a requires implementation of water conservation measures for transportation projects. Mitigation Measure WS-1b requires implementation of water conservation measures as part of land development projects. Mitigation Measure WS-1c requires development projects to verify adequate water supply is available to satisfy projected water demands. Implementation of Mitigation Measures WS-1a, WS-1b, and WS-1c would not guarantee the reduction of proposed Plan impacts associated with the availability of water supplies to a less-than-significant level in year 2050. Therefore, the proposed Plan's incremental contributions to the cumulative water supply impacts in year 2050 would remain cumulatively considerable after mitigation is incorporated.

To reduce environmental impacts resulting from land use changes and transportation facility development on the sustainable yield of groundwater basins, Mitigation Measure WS-2 requires the County of San Diego, cities, and other local jurisdictions to ensure sustainable yield of groundwater basins during planning, design, and project-level CEQA review of development projects. However, it cannot be guaranteed that all future project-level impacts can be mitigated to a less-than-significant level. Therefore, the proposed Plan's incremental contributions to the cumulative impacts to groundwater resources in the years 2035 and 2050 would remain cumulatively considerable after mitigation is incorporated.

To reduce environmental impacts resulting from the construction of new or expanded water treatment of distribution facilities, Mitigation Measure WS-3 requires all jurisdictions and agencies with responsibility for the construction of new or expanded water treatment and conveyance facilities to apply mitigation measures to reduce significant environmental impacts associated with these facilities during the CEQA review process for individual facilities. However, it cannot be guaranteed that all future project-level impacts can be mitigated to a less-than-significant level. Therefore, the proposed Plan's incremental contributions to the cumulative impacts from new or expanded water facilities in the years 2035 and 2050 would remain cumulatively considerable after mitigation is incorporated.

4.19 WILDFIRE

This section evaluates the wildfire impacts of the proposed Plan.

4.19.1 Existing Conditions

Wildfire, as defined in California Public Resources Code (PRC) Sections 4103 and 4104, is any uncontrolled fire spreading through vegetative fuels that threatens to destroy life, property, or resources. Existing wildfire conditions in the San Diego region, including current land uses, understanding of wildfire behavior and controlling factors, wildfire conditions and history, fire hazard designations, and the anticipated effects of climate change as it relates to wildfire, are described below.

REGIONAL LAND USE CHARACTERISTICS

Historical Land Use and Regional Growth Patterns

The San Diego region is located in the southwestern corner of the United States and is bordered by Mexico to the south, the Pacific Ocean to the west, Orange and Riverside counties to the north, and Imperial County to the east. The San Diego region encompasses over 4,260 square miles and includes 18 incorporated cities, 17 tribal governments, and unincorporated San Diego County.

Existing Land Use

There are 2,725,648 acres in the San Diego region. Approximately 799,266 acres (30%) are developed with various land uses including residential, commercial/office, and industrial or generally support human activities, such as agriculture, military use, recreation, and infrastructure (transportation, communication, utilities) (SANDAG 2021a). Open space and parks account for the largest land area, with 1,374,188 acres, or about 50% of the region. Vacant land (524,010 acres) accounts for another 19%, and the remaining approximately 1% of the area is covered by water (28,184). See Section 4.11, "Land Use and Planning," of this EIR for additional information regarding the existing land uses in the region.

WILDFIRE BEHAVIOR AND CONTROLLING FACTORS

Natural Factors Affecting Wildfire Behavior

Wildfire behavior is a product of several variables—primarily weather, vegetation, topography, and human influences—that intermix to produce local and regional fire regimes that affect how, when, and where fires burn (NPS 2017). The continuity of fuels, expressed in both horizontal and vertical components, is also a determinant of wildfire potential and behavior. Topography is important because it affects the movement of air, which in turn affects the movement of fire, over the ground surface. The slope and shape of terrain can change the speed at which the fire travels, and the ability of firefighters to reach and extinguish the fire. Weather affects the probability of wildfire and is a strong determinant of fire behavior. Temperature, humidity, and wind (both short and long term) affect the severity and duration of wildfires (County of San Diego 2023a). The fire regime in any area is defined by several factors, including fire frequency, intensity, severity, and area burned (USFS 2023). Each of these is important for understanding how the variables that affect fire behavior produce fire risks. Fire frequency refers to the number of fires that occur in a particular area over a given period of time, fire intensity refers to the speed at which fire travels and the heat that it produces, fire severity involves the extent to which ecosystems and existing conditions are affected or changed by a fire, and area burned is the size of the area burned by wildfire. Development patterns contribute to wildfire risk in California as well.

Human Influence on Wildfire

Human influence on wildfire is broad and can be substantial. It includes direct influences, such as the ignition and suppression of fires, and indirect influences through climate change and alterations in land use patterns (refer to "Anticipated Effects of Climate Change" below for further discussion of the indirect effect of climate change on wildfire).

Anthropogenic influence more directly corresponds to fire frequency (i.e., number of ignitions) than size of a burn because humans are responsible for most wildfire ignitions. Once started, fire spread and behavior become a function of fuel characteristics, terrain, and weather conditions (Syphard et al. 2008). Human-induced wildfire ignitions can change fire regime characteristics in two ways: (1) changing the distribution and density of ignitions, and (2) changing the seasonality of burning activity (Balch et al. 2017). A study of wildfires across the United States for the 20-year period between 1992 and 2012 showed that 82% of wildfires during that period were started by human causes (Balch et al. 2017), whereas in California specifically, humans accounted for starting approximately 95% of wildfires (Syphard et al. 2007; Syphard and Keeley 2015). In 2022, more than half of all fires in California were caused by humans, and when miscellaneous and undetermined causes are included, that figure increases to 97% (CAL FIRE 2022).

Human ignitions include a multitude of sources, including escapes from debris and brush-clearing fires, electrical equipment malfunctions, campfire escapes, smoking, fire play (e.g., fireworks), vehicles, and arson. Consequently, areas near human development, especially in the wildland urban interface (WUI) or in areas near campgrounds and roads, generate fires at a more frequent rate than very remote or urban areas (Syphard et al. 2007; Mann et al. 2016; Balch et al. 2017). Circumstances in California have made the environment particularly vulnerable to human-caused fires with expansion of the WUI, which are areas where development is located close to open space or to lands with native vegetation and habitat prone to brush fires, and introduction of more people in areas susceptible to wildfire at all times of the year. A 2018 study indicates that the number of houses in the WUI increased nationwide by 41% between 1990 and 2010 (Radeloff et al. 2018).

Human Health Effects of Wildfire

In addition to vegetation and structural loss, wildfires also affect public health. Fire-related injuries and deaths are likely to increase as wildfires occur more frequently. Wildfires can also be a significant contributor to air pollution. When communities are located in areas that burn frequently, wildfire smoke, which can travel for miles, has a negative effect on human health (Black et al. 2017). Wildfire smoke contains numerous toxic and hazardous pollutants that are dangerous to breathe and can worsen lung disease and other respiratory conditions (County of San Diego 2023a). Exposure to particulate matter generated by wildfire events can result in significant health problems, including aggravated asthma, increased susceptibility to respiratory infections, and heart attacks and arrhythmias in people with heart disease (Sacramento Metropolitan Air Quality Management District 2018).

WILDFIRE HISTORY AND CONDITIONS IN THE SAN DIEGO REGION

In the last two decades, wildfires in California have increased in number of fires ignited, number of acres burned, and number of structures destroyed. Since 2020, the average annual cost of fire suppression in California in areas under state jurisdiction has averaged more than $818 million per year (CAL FIRE 2024a). In January 2025, the Los Angeles area experienced several wildfires that, based on preliminary estimates, have resulted in somewhere between $95 billion and $164 billion in total property and capital losses, making them the most expensive wildfires in State history (UCLA 2025). Of the nine wildfires in Los Angeles, the three largest (Palisades, Eaton, and Hughes Fires) burned more than 48,000 acres and damaged and destroyed more than 18,200 structures (CAL FIRE 2025a).

Of the top 20 largest California wildfires, 2 have been in San Diego County (CAL FIRE 2024b). According to the San Diego County Multi-Jurisdictional Hazard Mitigation Plan, San Diego County's worst wildfire occurred in October 2007 (County of San Diego 2023a). The fire started on October 21, 2007, near the United States–Mexico border and burned throughout the county until the last fire was fully contained on November 9, 2007. At the height of the fire event, there were 7 fires burning in San Diego County. The fires destroyed 369,000 acres (13% of the county), 2,670 structures, 239 vehicles, and 2 commercial properties. There were 10 civilian deaths, 23 civilian

injuries, and 10 firefighter injuries. The cost of fire damage exceeded $1.5 billion. In October 2003, the second-worst wildfire in the history of San Diego County destroyed 332,766 acres of land and 3,239 structures, caused 17 deaths, and resulted in approximately $450 million in damage. San Diego County's third-worst wildfire in history, known as the Laguna Fire, resulted in the loss or destruction of 383 homes and 1,200 other structures in 1970 (County of San Diego 2023a). In 2023 (the most recent year reported), more than $4 million of wildfire-related damage occurred in San Diego County alone (CAL FIRE 2023).

In 2018, the West Fire burned 505 acres in the county, and in 2020, the Valley Fire burned 76,067 acres in the county and damaged or destroyed 75 structures. The Valley Fire was intensified by dry vegetation, rugged terrain, and high temperatures and winds. According to the California Department of Forestry and Fire Protection (CAL FIRE) Redbook, there have been 1,113 wildfires recorded in San Diego County between 2015 and 2021, which translates to an average of 159 wildfires per year in the county during this timeframe (County of San Diego 2023a). More recently, there were 239 recorded wildfires in 2022 and 220 recorded wildfires in 2023 in San Diego County, of which three were greater than 300 acres in size and are considered large wildfires by CAL FIRE (CAL FIRE 2022, 2023).

Several factors, including climate, native vegetation, topography, and development patterns, make the San Diego region susceptible to wildfires. The San Diego region's topography consists of a semiarid coastal plain and rolling highlands, which, when fueled by shrub overgrowth, occasional Santa Ana winds, and high temperatures, creates an ever-present threat of wildfire. In addition, extended droughts, characteristic of the region's Mediterranean climate and exacerbated by climate change, result in large areas of dry vegetation that provide fuel for wildland fires. Extreme weather conditions, such as high temperatures, low humidity, or winds of extraordinary force, may cause an ordinary fire to expand into one of massive proportions (County of San Diego 2023a). Wildfire risk tends to be high in locations with dense vegetation, dry conditions, and steep slopes. As such, there is a high wildfire risk in the hills and mountains in the eastern San Diego region where sparse development intermingles with fire-prone native vegetation. However, urban areas can also be at risk where the unique mesa-canyon topography of coastal San Diego puts development in proximity to steep slopes and dense vegetation. Typically, vegetation absorbs rainfall and reduces runoff. However, after wildfire burns the vegetation that anchors soil to the hillside, chances increase that a flash flood, mudflow, or landslide could occur in the event of heavy rains because the ground is no longer able to absorb water (FEMA 2020).

Common causes of fires in San Diego County include equipment use, vehicle fires spreading into wildlands, accidental starts from warming or debris fires, and arson. The predominant cause of wildfire changes from year to year in the State Responsibility Area (SRA) within both San Diego County and the State. When considered over the period of 2019 through 2023 and excluding miscellaneous and undetermined causes, most fires in the State SRA were caused by debris burning, followed by vehicles and equipment use, whereas the majority of fires within San Diego County SRA (approximately 59%) were caused by vehicles followed by equipment use and arson (Table 4.19-1).

Table 4.19-1 Causes of Fire in San Diego County and the State within the SRA (2019–2023)

Year	Area	Total	Arson	Camp fire	Debris Burning	Electrical Power[1]	Equipment Use	Light-ning	Misc.	Playing with Fire	Rail-road	Smok-ing	Undeter mined	Vehicle
2023	San Diego	220	26	1	16	14	24	4	63	3	0	1	43	25
2023	Statewide	3,236	359	47	591	176	348	197	819	32	2	27	321	310
2022	San Diego	239	22	11	12	6	25	6	73	7	0	1	51	25
2022	Statewide	3,333	358	86	488	228	370	89	824	55	6	44	435	350
2021	San Diego	208	22	9	13	16	20	16	26	3	0	3	49	31
2021	Statewide	3,054	386	104	476	284	329	152	269	54	6	60	515	419
2020	San Diego	179	11	2	19	8	28	1	20	7	0	0	56	27
2020	Statewide	3,501	320	110	579	335	381	264	326	80	6	47	604	449
2019	San Diego	128	2	2	17	5	14	9	14	2	0	2	48	13
2019	Statewide	3,086	284	122	468	304	354	195	280	52	3	41	607	376

FIRE HAZARD DESIGNATIONS

Wildfire prevention is a shared responsibility among federal, state, and local agencies, including local city and county fire departments, as well as landowners and residents. Federal lands are classified as Federal Responsibility Areas. Most of the unincorporated areas of the San Diego region are classified as SRAs, which are areas where fire prevention is the responsibility of CAL FIRE. Incorporated areas, and some unincorporated lands, are classified as Local Responsibility Areas (LRAs). Fire prevention and response in these areas are typically addressed by city and county fire departments, occasionally with assistance from CAL FIRE. CAL FIRE identifies Fire Hazard Severity Zones (FHSZs) at the local, state, and federal level that cover all fire-prone areas in the state, regardless of land ownership or responsibility.

CAL FIRE defines and maps FHSZs to identify the potential fire hazard severity expected in different areas within the State, as required by PRC Sections 4201–4205. FHSZs are determined based on an area's vegetation, topography (slope), weather (including winds), crown fire potential, and ember production and movement potential. FHSZs include the classifications Very High, High, and Moderate in areas where the State is responsible for fire protection (i.e., SRAs) (CAL FIRE 2025b). CAL FIRE released updated maps of FHSZs within SRAs for public comment in 2022. These maps show an overall reduction in lands within High FHSZs and an increase in lands within the Very High FHSZ designation in the San Diego region. These designations have been adopted and became effective on April 1, 2024.

The majority of the San Diego region is within an SRA for fire prevention and suppression (Figure 4.19-1). FHSZ maps also identify Moderate, High, and Very High FHSZs in areas where local agencies are responsible for fire protection (i.e., LRAs) (CAL FIRE 2025c). In the San Diego region, local fire protection is provided by fire protection districts and county service areas in unincorporated parts of the county, and by city fire departments and joint powers agreements within city boundaries. Local fire protection is discussed in more detail in Section 4.15, "Public Services and Utilities," while existing emergency response and evacuation in the region is discussed in Section 4.9, "Hazards and Hazardous Materials," of this EIR. Approximately 45% of the San Diego region consists of areas that are designated as a Very High or High FHSZ (Table 4.19-2).

Table 4.19-2 Wildfire Risk in the San Diego Region

FHSZ Designation	Acres	Percent of San Diego Region
Very High	1,084,766	40
High	128,991	5
Moderate	184,568	7
Unmapped	1,328,813	49
Total	2,727,138	100

The San Diego region also includes several areas within the WUI. The WUI is defined as an area where structures and other human development meet or intermingle with undeveloped wildland or vegetative fuels (CAL FIRE 2018). These conditions create an environment in which fire can move readily between structural and vegetation fuels. The WUI consists of areas designated as either Wildland Urban Interface, Wildland Urban Intermix, or Wildfire Influence Zones (CAL FIRE 2018). Interface zones are areas where housing with a density greater than 0.05 dwelling units per acre is adjacent to vegetation that can burn in a wildfire. Intermix zones are areas of more sparsely populated development than Interface areas but are interspersed in areas dominated by wildland vegetation subject to wildfire. Both Interface and Intermix zones are in areas designated as Moderate, High, or Very High FHSZs. In addition, the Wildfire Influence Zone includes all areas with wildfire susceptible vegetation up to 1.5 miles from Interface or Intermix zones (CAL FIRE 2019b). Approximately 1,137,410 acres, or 42%, of the San Diego region is within the WUI (see Figure 4.19-2).

Figure 4.19-2 Wildland Urban Interface, Wildland Urban Intermix, or Wildfire Influence Zones

Furthermore, the California Public Utilities Commission (CPUC) maintains a high fire threat district (HFTD) map. The CPUC HFTD Map includes three fire-threat areas (CPUC 2018):

- Tier 3 consists of areas on the CPUC Fire-Threat Map where there is an extreme risk from wildfires associated with overhead utility power lines or overhead utility power-line facilities also supporting communication facilities.
- Tier 2 consists of areas on the CPUC Fire-Threat Map where there is an elevated risk from wildfires associated with overhead utility power lines or overhead utility power-line facilities also supporting communication facilities.
- Zone 1 consists of Tier 1 High-Hazard Zones (HHZs) from the US Forest Service (USFS) and CAL FIRE joint map of tree mortality HHZs. Tier 1 HHZs are in direct proximity to communities, roads, and utility lines, and are a direct threat to public safety.

ANTICIPATED EFFECTS OF CLIMATE CHANGE

Wildfire risk is determined by several factors: wind speeds, drought conditions, available wildfire fuel (i.e., dry vegetation), past wildfire suppression activity, and expanding wildland-urban interface (Westerling 2018). In California, wildfires are a significant threat, particularly in recent years as the landscape responds to climate change and decades of fire suppression. It is estimated that since 1985, more than 50% of the increase in the area burned by wildfire in the western United States is attributable to anthropogenic climate change (Abatzoglou and Williams 2016). Climate change is expected to result in a longer and less predictable fire season and drive factors that may worsen wildfires, such as increased temperatures more frequent and intense dry Santa Ana winds, drier autumns, and increased development and presence of dead fuels (Kalansky et al. 2018). All wildfires (those initiated by both natural and human-made sources) tend to be larger under drier atmospheric conditions and when fed by drier fuel sources (Balch et al. 2017).

In addition, climate change has led to exacerbation of wildfire conditions during a longer period of the year as the spring season has warmed—driving an earlier spring snowmelt—and as winter precipitation has decreased. Furthermore, wildfire activity is closely related to temperature and drought conditions, and in recent decades, increasing drought frequency and warming temperatures have led to an increase in wildfire activity (Schoennagel et al. 2017). A significant change in the global character of wildland fire in recent decades is the increase in high-intensity wildfires described as 'megafires.' The rise of megafires – categorized as more than 100,000 acres (> 40,000 hectares) – on public lands in the western US and other regions have signaled widespread conflagrations caused by changes in climate, land use, and human fire habits (Christiansen et al. 2024). In particular, the western United States, including California, has seen increases in wildfire activity in terms of area burned, number of large fires, and fire season length (Abatzoglou and Williams 2016). These conditions have resulted in the largest, most destructive, and deadliest wildfires on record in California's history. Nineteen of the 20 largest wildfires in California have happened since 2000 - 10 of which took place in 2020 or later (CAL FIRE 2024b). Eight of the 20 most destructive California wildfires have taken place in 2020 or later, resulting in more than 25,000 structures burned (CAL FIRE 2025d), and 13 of the top 20 deadliest wildfires have occurred since 2000 (CAL FIRE 2025e). These megafires, exacerbated by climate change, have the potential to inflict major, long-lasting effects on highway transportation infrastructure systems. The 2020 Labor Day wildfires that occurred in Washington, Oregon, and California burned nearly 3.5 million acres (1.4 million hectares) over a period of 15 days, 117 days, and 112 days respectively, resulting in huge expenses for reopening vital roadway infrastructure and losses from reduced commerce and tourism. Total anticipated costs incurred from the 2020 Labor Day megafires for both temporary and permanent repairs included over $24 million for hazard trees, $17.5 million for slope-rock scaling, $43 million for structural damage, and over $3 million for traffic control (Christiansen et al. 2024).

Due to its semiarid climate, shrubland, and the nearby presence of the Santa Ana winds, the San Diego region is susceptible to and experiences wildfire. The high temperatures and droughts caused by climate change could increase wildfire intensity and frequency. With hotter temperatures and possibly fewer rainy days in the coming decades, vegetation could become drier. As a result, it is likely that the San Diego region will see an increase in the

frequency and intensity of fires and acreage burned, making the region more vulnerable to devastating fires, like the ones seen in 2003 and 2007. The fire season could also become longer and less predictable, with larger and more catastrophic fires that could make firefighting efforts more costly (County of San Diego 2023a).

Wildfires also result in secondary impacts. A major consequence of wildfires is post-fire flooding (which is also expected to increase in the San Diego region because of the increase in extreme precipitation events), mudslides, and debris flows. Flooding may result in mudslides and debris flows from vegetation loss and excess runoff that washes away soils destabilized from wildfire (Bedsworth et al. 2018). These flows could also pose a hazard to people and structures in high fire-risk areas, can occur with little warning, and can exert extreme force on objects in their path. Post-wildfire debris flows also represent a significant hazard for transportation infrastructure. The location and intensity of post-fire debris movements are difficult to predict, and threats can persist for several years until the watershed is restored to pre-fire conditions. This situation would likely worsen as climate change forecasts predict increasing numbers of wildfire burned areas and extreme precipitation intensity (Li and Chester 2023).

4.19.2 Regulatory Setting

FEDERAL LAWS, REGULATIONS, PLANS, AND POLICIES

International Fire Code

Published by the International Code Council, the International Fire Code (IFC) is a model upon which the current California Fire Code (24 CCR Section 9) is based (ICC 2023). The IFC is the nationally recognized code that sets standards and requirements to safeguard against the threat that fires may pose to public health, safety, and the environment. The IFC, when adopted by a jurisdiction, regulates the planning, construction, and maintenance of development in all areas.

National Fire Plan

The Department of the Interior's National Fire Plan is intended to guarantee an appropriate federal response to severe wildland fires, reduce fire impacts on rural communities, and ensure sufficient firefighting capacity in the future (USDOI 2000). The plan's Rural Fire Assistance program called for enhancing the fire protection capabilities of rural fire districts and safe and effective fire suppression in the "wildland-urban interface," which led to the further definition and identification of WUIs in the *Federal Register* (USDA 2001) and the use of the term in other federal and state plans. The program promotes close coordination among local, state, tribal, and federal firefighting resources by conducting training, purchasing equipment, and providing prevention activities on a cost-shared basis. CAL FIRE incorporates concepts from this plan into local fire planning efforts.

The Disaster Mitigation Act of 2000

The Disaster Mitigation Act of 2000 (DMA 2000) (Public Law 106-390) provides the legal basis for FEMA mitigation planning requirements for state, local, and tribal governments as a condition of receiving national post-disaster Hazard Mitigation Grant Program (HMGP) funding. DMA 2000 amended the Robert T. Stafford Disaster Relief and Emergency Assistance Act by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need for state, local, and tribal entities to closely coordinate mitigation planning and implementation efforts. Section 322 of DMA addresses mitigation planning at the state and local levels. It identifies requirements that allow HMGP funds to be used for planning activities and increases the amount of HMGP funds available to states that have developed a comprehensive, enhanced mitigation plan prior to a disaster. States and communities must have an approved mitigation plan in place prior to receiving post-disaster HMGP funds.

US Geological Survey Landslide Hazard Program

The US Geological Survey created the Landslide Hazard Program (LHP) under the requirements of Public Law 106-113. The primary objective of the LHP is to reduce long-term losses from landslide hazards by improving the understanding of the causes of ground failure and suggesting mitigation strategies. The federal government takes

the lead role in funding and conducting this research, whereas the reduction of losses due to geologic hazards is primarily a state and local responsibility.

Executive Order 13855

On December 2018, Executive Order (EO) 13855 was issued, directing the US Department of Agriculture (USDA) and US Department of the Interior (DOI) to implement policies to improve forest management practices by reducing hazardous fuel loads, mitigating fire and postfire risks, and ensuring the safety of local communities. The departments were directed to collaborate with state, local, and tribal entities in creating a comprehensive wildfire strategy prioritizing the highest-risk lands. The EO contained acreage targets for fuel reduction and directives regarding the quantities of lumber to be thereby produced. Acreage targets were also provided for postfire treatments to maintain water quality and prevent erosion. The order also prioritizes proper maintenance of public roads vital to conducting management activities.

Infrastructure Investment and Jobs Act and Five-Year Wildfire Monitoring, Maintenance, and Treatment Plan

The Infrastructure Investment and Jobs Act, also known as the Bipartisan Infrastructure Law (BIL), was signed into law in November 2021 and authorized $1.2 trillion for repairing and modernizing the nation's transportation and infrastructure. Included in the BIL is more than $5 billion for DOI and USDA to reduce the risk of catastrophic wildfires. Specifically, Section 40803(j)(1) of the BIL directed DOI and USDA to establish a Five-Year Wildfire Monitoring, Maintenance, and Treatment Plan (Five-Year Plan) that:

- Reduces severe fire risk on 10 million acres of Federal land, Tribal forest lands, and rangeland that pose a high wildfire hazard.
- Develops a process for prioritizing treatments in areas and communities at the highest risk of catastrophic wildfire in direct partnership with state and local entities and affected stakeholders.
- Leverages public-private partnerships; prioritizes projects that have been evaluated under the National Environmental Policy Act (NEPA) and are ready for implementation; streamlines subsequent projects based on existing statutory or regulatory authorities; and develops interagency teams to increase coordination and efficiency under NEPA.

As required under the BIL, the DOI and USDA published the first iteration of the Five-Year Plan in April 2022. The Five-Year Plan complements USDA's 10-Year Strategy in emphasizing fire-prone DOI and Tribal lands comprising up to 30 million additional acres. These include rangelands and other vegetative ecosystems that pose serious fire risks. Together, USDA's 10-Year Strategy and DOI's Five-Year Plan will inform the development of a joint USDA and DOI long-term, outcome-based monitoring, maintenance, and treatment strategy that is required by Section 40803(j)(2) of the BIL by 2026 (DOI and USDA 2022).

STATE LAWS, REGULATIONS, PLANS, AND POLICIES

CAL FIRE Strategic Plan

CAL FIRE's Strategic Plan is intended to provide CAL FIRE with appropriate guidance for adequate statewide fire protection of SRAs, in accordance with PRC Section 4130 (CAL FIRE 2024c). The plan addresses both wildfire prevention and suppression activities, and management of the State's forests to help meet California's climate change goals. The goals of the plan include improving CAL FIRE's core capabilities, enhancing internal operations, ensuring employee health and safety, and building an engaged, motivated, innovative workforce.

California Public Resources Code Sections 4125–4137 (Responsibility for Fire Protection)

This statute requires the State Board of Forestry and Fire Protection to classify all state lands in which the financial responsibility of preventing and suppressing fires is primarily the responsibility of the State, or SRAs, and therefore under the jurisdiction of CAL FIRE. All state lands that are not classified as an SRA are considered to be the

responsibility of local or federal agencies. SRAs include lands capable of producing forest products; lands covered by timber, brush, undergrowth, or grass that protect the soil from erosion; and lands used for range or forage purposes.

SRA Minimum Fire Safe Regulations

CCR Title 14, Division 1.5, Section 1270 et seq. establishes CAL FIRE's basic wildland fire protection standards for new development and is applicable in all SRAs in California—areas where CAL FIRE is responsible for wildfire protection. Title 14 establishes the minimum standards required for fire protection for emergency access, fuel modification (including a defensible space of 100 feet around structures), setback to property line, signage, and water supply. To comply with the standards, proposed development must include road and street networks that provide safe access for emergency wildland fire equipment and civilian evacuation concurrently. Newly constructed buildings and roads must post clearly visible signs, including names and contact numbers visible from the roadway. Emergency water for wildfire protection must be available and accessible in specified quantities. Finally, to reduce the intensity of a wildfire, strategic siting of fuel modification and greenbelts must meet specific requirements.

California Fire Code

The California Fire Code is Part 9 of the California Building Code (CBC), which is set forth in CCR Title 24. The California Fire Code is created by the California Building Standards Commission, is based on the IFC created by the International Code Council, and is revised and republished every 3 years. Chapter 49 of the California Fire Code defines requirements for building construction and vegetation and fuel management within WUI areas. In the WUI, all new buildings must comply with California Fire Code standards, which define building construction requirements intended to reduce wildfire exposure. In addition, buildings within the WUI must comply with California laws and regulations that require maintenance of a "defensible space" of 100 feet from structures (PRC Section 4291, CCR Section 1299.03).

California Public Resources Code Sections 4201–4204 (Fire Hazard Severity Zones)

This statute directs CAL FIRE to map and periodically review FHSZs within SRAs based on determining factors, such as fuel loading, slope, and fire weather and winds. These FHSZs are the basis for identifying requirements for fire protection found in other regulations, such as the California Fire Code.

California Public Resources Code Section 4427 (Fire Hazard Area Equipment Restrictions)

PRC Section 4427 includes fire safety statutes that restrict the use of equipment that may produce a spark, flame, or fire; require the use of spark arrestors on construction equipment with internal combustion engines; specify requirements for the safe use of gasoline-powered tools in fire hazard areas; and specify fire suppression equipment that must be provided on site for various types of work in fire-prone areas.

California Public Utilities Commission General Order 95: Rules for Overhead Transmission Line Construction

California Public Utilities Commission General Order 95 was initially adopted in 1941 and was most recently updated in 2009 for Southern California. General Order 95 governs the design, construction, and maintenance of overhead electrical lines. Rule 31.1 generally states that design, construction, and maintenance of overhead electrical lines should be done in accordance with accepted good practices for the given location conditions known at the time by the persons responsible for the design, construction, and maintenance of the overhead electrical lines and equipment. Rule 35 of General Order 95 (Tree Trimming) requires the following:

- four feet radial clearance for any conductor of a line operating at 2,400 volts or more, but less than 72,000 volts
- six feet radial clearance for any conductor of a line operating at 72,000 volts or more, but less than 110,000 volts
- 10 feet radial clearance for any conductors of a line operating at 110,000 volts or more, but less than 300,000 volts
- 15 feet radial clearances for any conductor of a line operating at 300,000 volts or more

Senate Bill 1241 (Kehoe) of 2012

Senate Bill (SB) 1241 (Chapter 311, Statutes of 2012) requires cities and counties to address fire risk in SRAs and Very High FHSZs in the safety element of their general plans. It also requires cities and counties to make certain findings available regarding fire protection and suppression services before approving a tentative subdivision map or parcel map designated as a Very High FHSZ or that are in an SRA. The bill also resulted in amendments to Appendix G of the CEQA Guidelines to include questions related to fire hazard impacts for projects located in or near lands classified as SRAs and Very High FHSZs.

Senate Bill 901 (Dodd) of 2018

Senate Bill 901 (Chapter 626, Statutes of 2018) mandates all electric utilities to prepare and submit wildfire mitigation plans that describe the utilities' plan to prevent, combat, and respond to wildfires affecting their service territories. CPUC reviews and refines the plans before implementing and enforcing them. SB 901 was enacted in response to the devastating 2017 wildfire season, in which wildfires caused by faulty Pacific Gas & Electric utility lines burned over 4,000 square miles of land across the state.

Senate Bill 190 (Dodd) of 2019

SB 190 (Chapter 404, Statutes of 2019) includes a specific requirement for the state fire marshal to develop best models for defensible space and additional standards for home hardening and construction materials to increase the resilience of communities. The bill also requires the state fire marshal to develop training programs for WUI fire safety building standards compliance for local building officials, builders, and fire service personnel.

Senate Bill 456 (Laird) of 2021

SB 456 (Chapter 387, Statutes of 2021) codified a statewide wildfire preparedness and response plan that includes prescribed burning, forest stewardship, and restoration in burned areas. Specifically, the bill renamed the Forest Management Task Force to the Wildfire and Forest Resilience Task Force and required the task force, including the agency and the department, on January 1, 2022, to develop a comprehensive implementation strategy to track and ensure the achievement of the goals and key actions identified in the action plan. The bill also requires the implementation strategy to address specified actions, including increasing the pace and scale of wildfire and forest resilience activities. Finally, the bill requires the task force, on or before January 1, 2026, and every 5 years thereafter, to update the action plan.

Assembly Bill (Wood) 2551 of 2018

Assembly Bill (AB) 2551 (Chapter 638, Statutes of 2018) authorizes CAL FIRE to collaborate with private landowners on controlled burns to reduce wildfire fuel. Specifically, the bill would authorize CAL FIRE to enter into an agreement with the owner or any other person who has legal control of any property, any public agency with regulatory or natural resource management authority over any property that is included within any wildland, or any nonprofit organization to conduct joint prescribed burning operations that serve the public interest and are beneficial to the state.

Assembly Bill 38 (Wood) of 2019

AB 38 (Chapter 391, Statutes of 2019) requires the Office of Emergency Services and CAL FIRE to develop best practices for community-wide resilience against wildfires through home hardening, defensible space, and other measures. In addition, sellers of real property located in a High or Very High FHSZ will be required to provide specified documentation to the buyer that the property is in compliance with the wildfire protection measures.

Assembly Bill 836 (Wicks) of 2019

AB 836 (Chapter 393, Statutes of 2019) establishes the Wildfire Smoke Clean Air Centers for Vulnerable Populations Incentive Pilot Program, which provides retrofits of air ventilation systems to create community clean air centers in order to mitigate the adverse public health impacts of wildfires and other smoke events. The program will prioritize areas with a high cumulative smoke exposure burden.

Assembly Bill 3074 (Friedman) of 2020

AB 3074 (Chapter 259, Statutes of 2020) imposes additional fuel reduction requirements on a person who owns, leases, controls, operates, maintains, or builds an occupied dwelling or structure in, upon, or adjoining wild lands within a Very High FHSZ. This bill requires additional fuel clearance between 5 and 30 feet around the structure, and an ember-resistant zone within 5 feet of the structure based on regulations promulgated by the State Board of Forestry and Fire Protection. Application of these regulations would be the responsibility of the local agency that has jurisdiction over the property and CAL FIRE.

Assembly Bill 642 (Friedman) of 2021

AB 642 (Chapter 375, Statues of 2021) requires the Director of CAL FIRE to identify areas in the State as moderate and High FHSZs, in addition to Very High FHSZs. This bill also further expands the use of prescribed burning, particularly by growing and incorporating cultural burning by tribal communities. The bill streamlines the permitting system for burning permits and creates a prescribed burning training center to increase the number of skilled practitioners. It would require the CAL FIRE to work more closely with Native American tribes, tribal organizations, and cultural practitioners, in part by creating a Cultural Burning Liaison within the department.

General Plan Safety Element Wildfire Requirements

California Government Code Section 65302(g) requires general plans to include a safety element that addresses risks from natural hazards, including wildland and urban fires. As of January 1, 2014, safety elements are required to be reviewed and updated as necessary to address the risk of fire for land classified as state responsibility areas, as defined in PRC Section 4102, and land classified as very high fire hazard severity zones, as defined in PRC Section 51177 (Government Code Section 65302[g][3]). Government Code Section 65302(g)(3) specifies several requirements for inclusion in the review and update of the safety element, including the consideration of the LCI's most recent publication of "Fire Hazard Planning, General Plan Technical Advice Series". At least 90 days prior to the adoption or amendment of their safety element, counties that contain SRAs and cities or counties that contain Very High FHSZs must submit their safety element to the board of Forestry and Fire Protection (Government Code Section 65302.5[b]). The board reviews the safety element and responds to the city or county with its findings and recommended changes regarding the uses of land and policies in SRAs or Very High FHSZs that will protect life, property, and natural resources from unreasonable risks associated with wildfires, and the methods and strategies for wildfire risk reduction and prevention within SRAs or Very High FHSZs (Government Code Section 65302.5[b][3]). The county board of supervisors or city council must consider the Board of Forestry and Fire Protection's recommendations and respond to the board in writing if any of the recommendations are not accepted.

Office of Land Use and Climate Innovation Fire Hazard Planning Technical Advisory

The Governor's Office of Planning and Research (OPR) (now the Office of Land Use and Climate Innovation [LCI]) first published the *Fire Hazard Planning Technical Advisory* in 2015 to provide a robust planning framework for addressing fire hazards, reducing risk, and increasing resilience across California's diverse communities and landscapes. The *Fire Hazard Planning Technical Advisory* provides guidance on wildfire-related policies and programs that local agencies should include in their general plans and is also intended to assist city and county planners in discussions with professionals from fire hazard prevention and mitigation, disaster preparedness, and emergency response and recovery agencies as they work together to develop effective fire hazard policies for the general plan. Consistent with the requirements of SB 901 (Dodd 2018) and AB 2911 (Friedman 2018), as codified in Government Code Section 65040.21, LCI updated the technical advisory in 2022 to include specific land use strategies to reduce fire risk to buildings, infrastructure, and communities. LCI prepared the 2022 update in consultation with CAL FIRE, the State Board of Forestry and Fire Protection, and other fire and safety experts.

Office of Land Use and Climate Innovation Wildland-Urban Interface Planning Guide

In August 2022, OPR (now LCI) published the Wildland-Urban Interface Planning Guide (WUI Planning Guide) (OPR 2022). The WUI Planning Guide is intended to provide guidance to planners, wildfire mitigation practitioners, and other professionals and decision-makers regarding the variety of options available to support WUI planning in California. WUI planning tools are those that can be adopted and implemented as standalone tools or as integral

components of plans, local ordinances, agreements, programs, or other activities. The tools included in the guide are intended to provide short- and long-term options for addressing the WUI and associated wildfire hazard or risk at the home, parcel, neighborhood, and community (or district) level.

California's Wildfire and Forest Resilience Action Plan

The Governor's Forest Management Task Force (Task Force) was established in 2018 to introduce a holistic, integrated approach towards forest management. The Task Force's purpose is to develop a framework for establishing healthy and resilient forests that can withstand and adapt to wildfire, drought, and climate change. In January 2021, the Task Force published *California's Wildfire and Forest Resilience Action Plan* (Action Plan), which was the result of over two dozen interagency and stakeholder-led workgroups. The Action Plan includes recommendations addressing various aspects of the state's forest health and wildfire crisis and serves as a roadmap for implementing the Agreement for Shared Stewardship of California's Forest and Rangelands (Shared Stewardship Agreement) with USFS under USDA, and for aligning the state's efforts with other federal, local, tribal, regional and private organizations (California Forest Management Task Force 2021).

California Adaptation Planning Guide

In June 2020, the California Governor's Office of Emergency Services published the latest update to its Adaptation Planning Guide (OES 2020). The guide is intended to assist local governments, regional entities, and climate organizations with incorporating best practices and current science and research into their adaptation plans to address climate change, including wildfire.

LOCAL LAWS, REGULATIONS, PLANS, AND POLICIES

County of San Diego Code of Regulatory Ordinances Sections 96.1.004 and 96.1.4907

The San Diego County Fire Authority and Fire Districts, in partnership with CAL FIRE, the US Bureau of Land Management (BLM), and USFS, is responsible for the enforcement of defensible space inspections. Inspectors from CAL FIRE are responsible for the inspection of properties to ensure an adequate defensible space has been created around structures. If violations of the program requirements are noted, inspectors provide a list of required corrective measures and provide a reasonable timeframe to complete the task. If the violations still exist upon reinspection, the local fire inspector will forward a complaint to the County for further enforcement action. This is part of the County Consolidated Fire Code, which was last updated in 2023 (described in greater detail below).

County of San Diego Consolidated Fire Code

The County of San Diego Consolidated Fire Code (County of San Diego 2023b) adopts, by reference, the California Fire Code (24 CCR Title 9) every 3 years when it is revised and republished. The Consolidated Fire Code consists of local fire protection district ordinances that have modified the fire code portion of the State Building Standards Code and any County of San Diego modification to the fire districts' amendments. The purpose of the Consolidated Fire Code is to protect public health and safety, which includes permit and inspection requirements for the installation, alteration, and repair of new and existing fire protection systems, and penalties for violations of the Consolidated Fire Code. The Consolidated Fire Code provides the minimum requirements for access, water supply and distribution, construction type, fire protection systems, and vegetation management. The County Fire Code applies to all new construction and to any alterations, repairs, or reconstruction, except as otherwise provided for in Title 9, Division 6, Chapter 1 of the County Code. The current version of the Consolidated Fire Code became effective on April 13, 2023.

San Diego County Multi-Jurisdictional Hazard Mitigation Plan

The federal Disaster Mitigation Act of 2000 (Public Law 106-390) requires all local governments to create disaster plans in order to qualify for hazard mitigation funding. The Multi-Jurisdictional Hazard Mitigation Plan is a countywide plan that identifies risks and ways to minimize damage by natural and human-made disasters. The plan is a comprehensive resource document that serves many purposes, such as enhancing public awareness, creating a decision tool for management, promoting compliance with state and federal program requirements, enhancing local policies for hazard mitigation capability, and providing interjurisdictional coordination. The plan

evaluates risks associated with coastal storms, erosion, tsunamis, dam failures, earthquakes, floods, rain-induced landslides, liquefaction, structure/wildland fires, and human-caused hazards. It also provides goals, objectives, and actions to reduce impacts from these hazards (County of San Diego 2023a).

The San Diego County Multi-Jurisdictional Hazard Mitigation Plan contains annexes that provide specific details and actions related to hazard mitigation for the following local jurisdictions within San Diego County: San Diego County, City of Carlsbad, City of Chula Vista, City of Coronado, City of Del Mar, City of El Cajon, City of Encinitas, City of Escondido, City of Imperial Beach, City of La Mesa, City of Lemon Grove, City of National City, City of Oceanside, City of Poway, City of San Diego, City of San Marcos, City of Santee, City of Solana Beach, City of Vista, Alpine Fire Protection District, Otay Water District, Padre Dam Municipal Water District, Rainbow Municipal Water District, San Diego County Water Authority, San Diego Unified Port District, Sweetwater Authority, and Vista Irrigation District (County of San Diego 2023a).

Municipal Fire Codes

Each of the 18 cities in the San Diego region has a fire code included in its municipal code. Like the County of San Diego Consolidated Fire Code, these codes all adopt by reference the California Fire Code with amendments that specify details such as local authority and contact information. Although all municipalities require compliance with California Fire Code vegetation management requirements for creating defensible space around structures, some municipalities include additional specifications for vegetation management, such as a preference for using native vegetation and special requirements for sensitive habitat or water conservation.

San Diego County Fire Authority Strategic Plan 2020–2025

In 2013, CFA transitioned from a largely volunteer force to the professional staffing of 35 stations that have responsibility for 1.5 million acres in the unincorporated area of the county. In 2019, CFA finalized its first 5-year plan (County of San Diego Fire Authority 2019). The plan has four goals related to (1) employee health and professional development, (2) exceptional emergency services, (3) resilient communities, and (4) organizational excellence and fiscal responsibility. Each goal has multiple objectives. Most relevant are those in the resilient communities category:

- develop and implement a more cohesive pre-fire strategy to achieve resilient communities,
- reduce potential for loss in existing structures,
- strengthen fire safety measures in new construction,
- enhance prefire vegetation management, and
- improve prefire emergency planning.

CAL FIRE San Diego Unit 2024 Strategic Fire Plan

The San Diego Unit 2024 Strategic Fire Plan serves as the San Diego region's localized wildfire preparedness and response framework, developed in alignment with the broader California Strategic Fire Plan. Authorized under Public Resources Code Sections 4114–4130, the state-level plan was crafted through collaboration between CAL FIRE and the California Board of Forestry and Fire Protection. It establishes a statewide vision of fostering a fire-adapted natural landscape and more fire-resistant built environments by coordinating efforts among local, state, federal, and private entities. This vision is supported by seven overarching goals and 57 actionable objectives. Each CAL FIRE Administrative Unit and Contract County, including the San Diego Unit, is tasked with creating and executing its own implementation strategy (CAL FIRE 2024d). In this context, the San Diego Unit's Fire Plan outlines how it will operationalize the state plan's goals and objectives through targeted actions detailed in its Battalion-level Work Plans.

San Diego Gas & Electric Company's Wildfire Mitigation Plan

San Diego Gas & Electric Company (SDG&E), in accordance with California SB 901, developed a Wildfire Mitigation Plan to describe the preventive strategies and programs SDG&E plans to adopt to minimize the risk of its electrical lines and equipment causing catastrophic wildfires (SDG&E 2024). The plan includes a risk analysis; a description

of wildfire prevention strategies and programs undertaken by SDG&E; and details related to inspections, system hardening, and emergency preparedness.

Community Wildfire Protection Plans

The Healthy Forests Restoration Act was enacted in 2003 and included statutory incentives for USFS and BLM to consider prioritized fuel reduction projects identified by local communities. This legislation led to the development of community wildfire protection plans (CWPPs). A CWPP is developed at the community level in areas at-risk of wildfire and is created in collaboration with community members, fire agencies operating in the area, local government, and other interested parties. The Healthy Forests Restoration Act and CWPPs emphasize the need for federal, state, and local agencies to work collaboratively with communities in developing hazardous fuel reduction projects and place priority on treatment areas identified by the communities themselves in a CWPP.

A CWPP serves two primary purposes. First, CWPPs identify and prioritize fuel reduction treatment projects needed in the local area and outline methods for addressing them. Second, CWPPs identify recommended measures to reduce structural ignitability (e.g., fire hardening). The process of developing a CWPP can help a community identify and clarify priorities for the protection of life, property, and critical infrastructure in the WUI. These plans are intended to be living documents and are updated as the needs in a community change and evolve. Thirty-nine cities and communities around San Diego County have an approved CWPP in place.

City and County General Plans

Local planning policies related to wildfire are established in each jurisdiction's general plan. Safety elements are required to address fire hazards, evacuation routes, and emergency response. As of January 1, 2013, SB 1241 of 2012 required that jurisdictions review and update their safety elements as necessary within 2 years of implementation of the next regional transportation plan, upon the next revision of their housing element, to address the risk of fire in SRAs and Very High FHSZs. These revisions must consider the provisions outlined in the OPR (now LCI) Fire Hazard Planning Technical Advisory and must include a number of specified content areas, such as fire hazard mapping; historical data on wildfires; identification of agencies with responsibility for fire protection; and goals, policies, and objectives for the protection of the community from the unreasonable risk of wildfire. As of June 2025, nine of the jurisdictions in the San Diego region have updated their General Plans in accordance with SB 1241. Local General Plan policies related to wildfire are summarized in Table B-2 of Appendix B.

County Resilience Review Report 1-19: Wildland Fires

The Resilience Review Process, the core assessment tool of the County's Resilience Program, was developed to identify gaps in how the County addresses community risks from both sudden disasters and long-term stressors. In March 2019, the Chief Administrative Officer directed a Resilience Review Working Group to explore ways to enhance wildfire resilience in unincorporated areas (County of San Diego 2019). Through collaboration with stakeholders, experts, and regional leaders, the group conducted a comprehensive evaluation of the County's existing wildfire preparedness, response, recovery plans, programs, and outreach efforts. The review concluded that the County already has strong systems in place and has made significant strides in wildfire preparedness, with many of the report's recommendations either underway or under consideration. The Resilience Review Working Group recommends 16 principal objectives divided among three focus areas: pre-fire, response, and recovery. The objectives are broken down into 50 specific tasks.

County Operational Area Wildland Urban Interface Policy # 8-A

Policy # 8-A sets consistent procedures for safe and effective wildland firefighting operations in San Diego County. As development expands into wildland areas, fire agencies face increased challenges and risks, especially in the WUI. WUI fires often exceed local response capacity, requiring mutual and automatic aid from multiple agencies, making clear communication and shared terminology essential. To ensure coordinated response, Policy # 8-A requires all San Diego County fire agencies to adopt, train on, and use the Firescope WUI Structure Protection Guidelines (County of San Diego OES 2013).

4.19.3 Significance Criteria

Appendix G of the CEQA Guidelines provides criteria for determining the significance of a project's environmental impacts, in the form of initial study checklist threshold questions. Unless otherwise noted, the significance criteria specifically developed for this EIR are based on the checklist questions that address the environmental issue areas in Appendix G of the CEQA Guidelines. In some cases, SANDAG has combined checklist questions, edited their wording, or changed their location in the document in an effort to develop significance criteria that reflect the programmatic level of analysis in this EIR and the unique characteristics of the proposed Plan. Notably, Appendix G Section XX, question (a), regarding whether the proposed Plan would substantially impair an adopted emergency response plan or emergency evacuation plan is addressed in criterion HAZ-4 in Section 4.9, "Hazards and Hazardous Materials." Conversely, Appendix G Section IX, question (g), regarding whether the proposed Plan would expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires is addressed in this section in criterion WF-1.

Implementation of the proposed Plan, where located in or near SRAs or lands classified as High or Very High FHSZs or, where specified, in other areas of the San Diego region, would have a significant wildfire impact if it would:

WF-1 Increase risk of wildland fire ignition and directly or indirectly expose people or structures to significant risk of loss, injury, or death involving wildland fires.

WF-2 Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

WF-3 Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.

WF-4 Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

4.19.4 Environmental Impacts and Mitigation Measures

WF-1 INCREASE RISK OF WILDLAND FIRE IGNITION AND DIRECTLY OR INDIRECTLY EXPOSE PEOPLE OR STRUCTURES TO SIGNIFICANT RISK OF LOSS, INJURY, OR DEATH INVOLVING WILDLAND FIRES.

Analysis Methodology

This section analyzes the types of conditions under which the forecasted regional growth and land use change and the planned transportation network improvements of the proposed Plan would increase the risk of wildland fire ignition and directly or indirectly expose people or structures to significant risk of loss, injury, or death involving wildland fires. Geographic Information System analysis is used to forecast regional growth and land use changes and planned transportation network improvements in High and Very High FHSZs within SRAs and LRAs. CAL FIRE FHSZ mapping takes into consideration vegetation, topography, weather, crown fire potential, and ember production and movement (CAL FIRE 2025b); therefore, these data were used to identify areas where forecast regional growth and land use changes and planned transportation network improvements could increase the risk of wildland fire ignition. Impacts were calculated by overlaying the forecast regional growth and land use footprint, and the transportation network improvements footprint onto mapped CAL FIRE data for High and Very High FHSZs in the San Diego region (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025). The acreage of each footprint that would expand into the High and Very High FHSZs is quantified and identified as areas where wildfire ignition risk could be increased with implementation of the proposed Plan. In addition, while not quantified, the analysis also considers areas of the region that are currently unmapped (e.g., within an FRA or LRA), as shown on Figure 4.19-1, but are considered wildfire prone based on vegetation,

topography, and other factors that influence wildfire. Finally, the analysis qualitatively considers the potential for increased wildfire ignition risk from regional growth and transportation network improvements within the WUI.

A significant impact would occur if forecast regional growth and land use development or planned transportation network improvements would increase the risk of wildland fire ignition and directly or indirectly expose people or structures to significant risk of loss, injury, or death involving wildland fires.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Wildfire prevention is a shared responsibility among federal, state, and local agencies, including local city and county fire departments, as well as landowners and residents. Federal lands are classified as Federal Responsibility Areas. The National Fire Plan provides the necessary coordination between agencies in areas of federal lands. As shown on Figure 4.19-1, most of the unincorporated areas of the San Diego region are classified as SRAs, which designate areas where fire prevention is the responsibility of CAL FIRE. Incorporated areas, and some unincorporated lands, are classified as LRAs. Fire prevention and response in these areas are typically addressed by city and county fire departments, occasionally with assistance from CAL FIRE. CAL FIRE identifies FHSZs at the local, state, and federal level that cover all fire-prone areas in the state, regardless of land ownership or responsibility.

To accommodate regional growth and land uses by 2035, new development, including residential, mixed-use, commercial areas, and industrial centers, and civic facilities would be constructed. As shown on Figures 4.19-1 and 4.19-2, much of the San Diego region is subject to wildland fire hazards. While most regional growth and land use development would consist of infill, development on the edges of urban areas and in outlying could increase the threat of wildland fires on human populations and property, as development may be located closer to and within the WUIs and High and Very High FHSZs. In addition, increased development on the edges of urban areas and in outlying areas would expand the WUI by incrementally encroaching into less developed areas that may be prone to wildfire. Using the methodology described above in "Analysis Methodology," an estimated 20,635 acres of new development would occur within FHSZs by 2035. Of this total, approximately 16,400 acres would occur on land classified as a Very High FHSZ, while approximately 2,090 acres would occur in areas classified as a High FHSZ (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025).

The potential expansion of the WUI by new development would occur throughout the region; however, as noted above, the vast majority (i.e., approximately 93.3%) of the forecasted increase in regional growth and associated development between 2022 and 2035 would occur in the cities of San Diego, Chula Vista, and San Marcos (Figure 4.19-3). Based on a review of aerial imagery (i.e., Google Earth) and as indicated on Figure 4.19-3, portions of Chula Vista, particularly the eastern portion of the city, and San Marcos may have a higher degree of fire danger than other areas of the region, owing to expansive areas of native vegetation and steeper slopes that could fuel and accelerate a fire. Aside from the less developed areas in the eastern portion of the region, the western portion of the region is also at high risk for fire hazards as it contains hundreds of miles of WUI due to the multitude of canyons throughout the area. This high fire risk is also reflected in the High and Very High FHSZ designations for the area, as depicted in Figure 4.19-1. Development along the canyon rims places structures in proximity to natural vegetation. While the City of San Diego is the most urbanized of the three cities that would experience the majority of regional growth, there are several areas throughout the city that contain wildfire prone conditions, particularly in the city's various canyons and other suburban areas that abut natural vegetation.

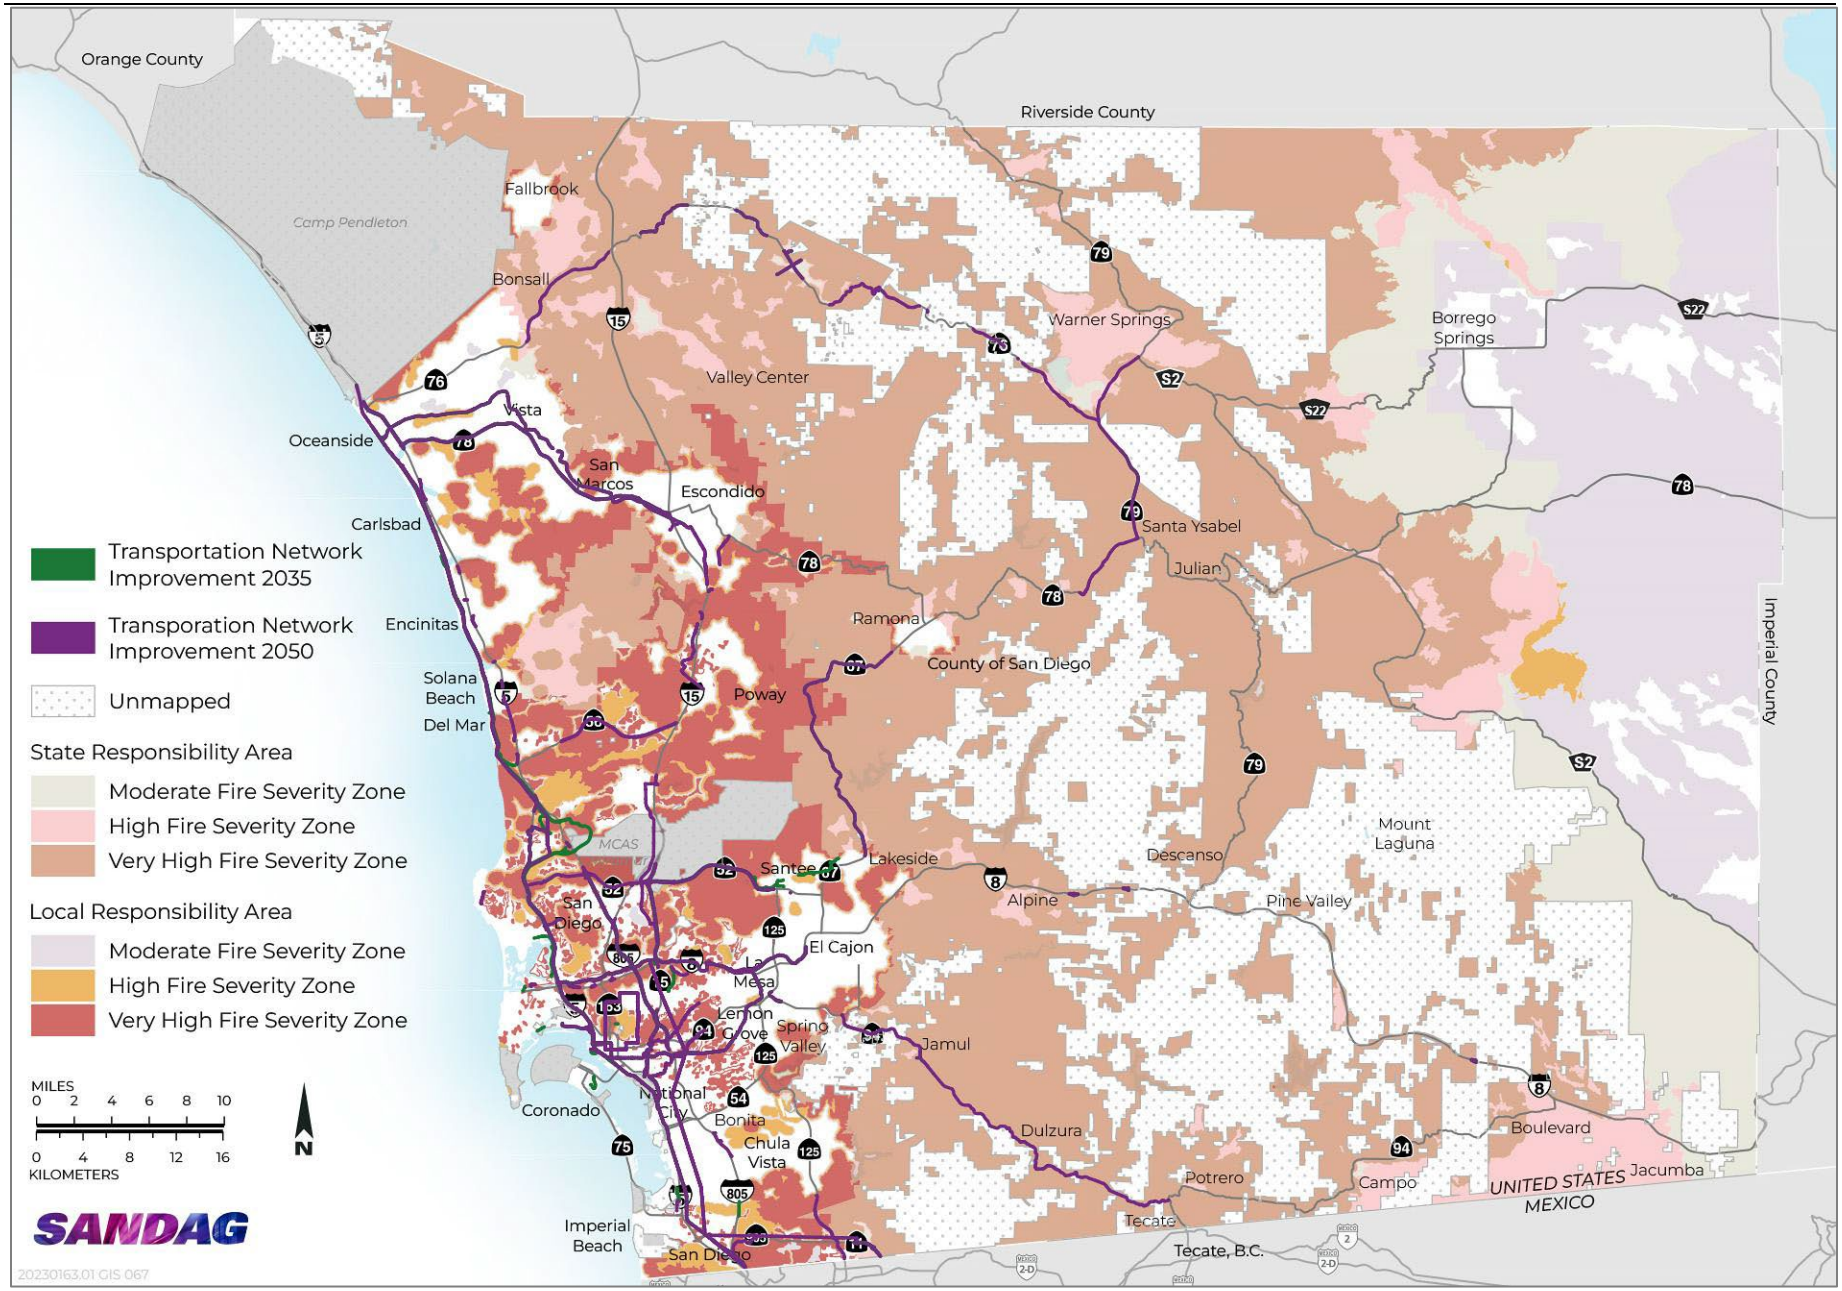
Figure 4.19-3 Fire Responsibility Area and Wildfire Hazard Severity Zones



Source: Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025.

Figure 4.19-4 Transportation Network Improvement Fire Risk

Because of these existing land characteristics, around which many communities are formed, new growth and development in areas classified as High and Very High FHSZs and in the WUI may increase the risk of wildfire ignition, as humans are responsible for most wildfire ignitions. In 2022, more than half of all fires in California were caused by humans, and when miscellaneous and undetermined causes are included, that figure increases to 97 percent (CAL FIRE 2022). Human ignitions include a multitude of sources, including accidental escape from debris and brush-clearing fires, electrical equipment malfunctions, campfire escapes, smoking, fire play (e.g., fireworks), vehicles, and arson. Thus, areas near human development, especially in the WUI or in areas near campgrounds and roads, generate fires at a more frequent rate than very remote or urban areas (Syphard et al. 2007; Mann et al. 2016; Balch et al. 2017). Common causes of wildfire in the region include equipment use, vehicle fires spreading into wildlands, accidental starts from warming or debris fires, and arson. As shown in Table 4.19-1, the predominant cause of wildfire changes from year to year in the SRA within San Diego County. When considered over the period of 2019 through 2023 and excluding miscellaneous and undetermined causes, the majority of the fires within the region (approximately 59 percent) were caused by vehicles, followed by equipment use and arson. As such, the primary causes of wildfire in the region can be attributed to increased development and human access to wildfire-prone areas of the county. Consequently, regional growth and associated development of land uses between 2022 and 2035 would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. In addition, growth experienced between 2022 and 2035 may result in an increased demand for fire protection services and increased demand on the region's existing water supply. In the event of a major wildland fire, the lack of available fire response staff or adequate response times, or infrastructure constraints such as insufficient water supply, may also contribute to an increased risk of wildland fire ignition.

Wildland fires may result in immediate damage to infrastructure such as buildings and facilities, and long-term damage from loss of forests or vegetation that may lead to erosion and unstable surfaces. The provision of defensible space would create a separation zone between wildlands and structures. Any development or redevelopment constructed within areas classified as High and Very High FHSZs and adjacent to wildlands in the WUI would be subject to the federal, state, and local statutory and regulatory requirements discussed in Section 4.19.2, *Regulatory Setting*. Specifically, new construction would be subject to the CBC (Title 24 of the CCR), which includes safety measures to minimize the threat of fire. The provisions of the CFC (Title 24, Part 9 of the CCR) would apply to all construction, alteration, replacement, removal, and demolition. The CBC and CFC establish requirements that would be applicable during construction and demolition, including proper storage procedures for combustible materials and proper refueling protocol. In addition, the risk of accidental ignition of a wildland fire during construction in high risk areas (i.e., High and Very High FHSZs and WUI) would also be addressed through compliance with PRC Section 4427, which includes fire safety provisions that restrict the use of equipment that may produce a spark, flame, or fire; require the use of spark arrestors on construction equipment with internal combustion engines; specify requirements for the safe use of gasoline-powered tools in fire hazard areas; and specify fire suppression equipment that must be provided on-site for various types of work in fire-prone areas. Moreover, Title 14 of the CCR sets forth the minimum development standards for emergency access, fuel modification, setback, signage, and water supply, which help prevent damage to structures or people by reducing wildfire hazards within SRAs. Requirements include ignition-resistant construction with exterior walls of noncombustible or ignition-resistant material from the surface of the ground to the roof system. Other fire-resistant measures would be applied to eaves, vents, windows, and doors to avoid any gaps that would allow intrusion by flame or embers.

Local jurisdictions' general plan policies and building codes enforce and expand on these requirements at the local level. In addition, local general plans contain policies and programs aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach. To effectively mitigate wildland fire hazards in the San Diego region, a multi-jurisdictional approach that involves federal, State, and local governments and fire agencies is necessary. Collectively, the local jurisdictions and fire agencies work together to prevent the loss of life in wildland fires, the ignition of structures by wildland fires, the encroachment of wildland fire into communities, and a wildfire-caused structural conflagration; as well as limit the size of wildland fires. Also, at the jurisdictional level, the continued monitoring and updating of existing

development regulations and plans reinforce the value of defensible space to further reduce the impact of wildfires on people and structures. Finally, public education and firefighter training, support, and emergency operations efforts help reduce the risks of impacts involving wildfires.

The existing laws, regulations, plans, and policies identified in Section 4.19.2, which are aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach, when coupled with the strategies above, would help reduce the risks posed to people and structures associated with wildland fires. However, due to the relatively large area within the San Diego region that is considered at high risk for wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands, regional growth and land use development associated with the proposed Plan would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. This impact would be significant.

Transportation Network Improvements

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR 75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

The transportation network improvements that would be implemented between 2022 and 2035 generally would be focused in the highly urbanized western portion of the region (Figure 4.19-4), and portions of this area remain susceptible to wildland fires due to climate, topography, and native vegetation. Using the methodology described above, an estimated 986 acres of new transportation network improvements would be developed within FHSZs by 2035. Of the 986 acres, new transportation network improvements would occupy approximately 217 and 702 acres of land classified as High and Very High FHSZs, respectively, between 2022 and 2035 (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025).

Construction-related fire hazards associated with transportation network improvements include welding and heavy equipment operation. However, the construction of transportation network improvements in High or Very High FHSZ or the WUI would be subject to the federal, State, and local statutory and regulatory requirements discussed in Section 4.19.2. This includes Title 24 of the CCR, which includes safety measures to minimize the threat of fire. In addition, PRC Section 4427 includes fire safety statutes that restrict the use of equipment that may produce a spark, flame, or fire; require the use of spark arrestors on construction equipment with internal combustion engines; specify requirements for the safe use of gasoline-powered tools in fire hazard areas; and specify fire suppression equipment that must be provided on site for various types of work in fire-prone areas. The provisions of the fire code would apply to all construction, alteration, replacement, removal, and demolition. The risk of accidental ignition of a wildland fire during construction in high risk areas (i.e., High and Very High FHSZs and WUI) would be addressed through standard construction practices, which address the potential for sparks generated by construction equipment, the potential for spills of ignitable materials, and emergency procedures to immediately respond to these conditions. Compliance with these regulations would reduce the likelihood that construction-related impacts associated with transportation network improvements occur.

In general, transportation projects and facilities are not typically susceptible to substantial damage from wildfires (i.e., because they are constructed of concrete and other non-flammable materials) and would not contribute added fuel to wildfires. In the case of megafires, however, which are exceptionally large, intense, and driven by extreme weather, the level of destruction can be such that transportation infrastructure is affected by closure, structural damage to road surfaces, mudslides and debris flows from adjacent slopes, and damage to utilities that

support transportation infrastructure (e.g., power lines, communication systems) (see Section 4.19.1, "Anticipated Effects of Climate Change," for additional discussion). More typically, the most noticeable effect of wildland fires on transportation systems are temporary interruption of service with little expectation of damage to property or injury to people. In addition, improving the capacity of the existing transportation network would result in increased use of the existing corridors beyond the terminus of current conditions, indirectly enhancing potential evacuation routes and/or providing additional firebreaks. All future transportation network improvements would be subject to project-specific environmental review, at which time mitigation measures would be identified, as applicable, to address potential impacts associated with increased risk of wildland fire ignition.

Although the majority of transportation improvements between 2022 and 2035 would be focused in the highly urbanized western portion of the region, the proposed Plan also includes improvements to rural intersections and interchanges on SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. These improvements would be located in areas prone to wildfire. Areas near human development, especially in the WUI or in areas near campgrounds and roads, generate fires at a more frequent rate than very remote or urban areas (Syphard et al. 2007; Mann et al. 2016; Balch et al. 2017). Common causes of wildfire in the region include equipment use, vehicle fires spreading into wildlands, accidental starts from warming or debris fires, and arson. As shown in Table 4.19-1, when considered over the period of 2019 through 2023 and excluding miscellaneous and undetermined causes, the majority of the fires within the region (approximately 59 percent) were caused by vehicles. Thus, implementation and operation of the transportation network improvements associated with the proposed Plan would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. Impacts would be significant.

2035 Conclusion

Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. These wildfire ignition risks would be exacerbated in areas classified as High and Very High FHSZs and in the WUI, as humans are responsible for most wildfire ignitions. Therefore, this impact (WF-1) would be significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050.

Similar to the 2035 analysis, new development, including residential, mixed-use, commercial areas, and industrial centers, and civic facilities would be constructed to accommodate regional growth between 2036 and 2050. Using the methodology described above, an estimated 2,608 acres of new development would occur within FHSZs by 2050. Of this total, approximately 2,305 acres would occur on land classified as a Very High FHSZ, while approximately 200 acres would occur in areas classified as a High FHSZ (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025). Although the regional population is forecasted to slightly decrease by 2050, new housing would continue to be developed in the City of San Diego, City of Chula Vista, and the unincorporated jurisdictions. In some instances, this new housing development, particularly in the unincorporated parts of the county, may not be contiguous to existing developed areas and would represent an expansion of the WUI. Thus, new development in areas classified as High and Very High FHSZs and in the WUI could increase the risk of wildfires as humans are responsible for most wildfire ignitions. Consequently, development of land uses

between 2036 and 2050 would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. In addition, growth experienced between 2036 and 2050 may result in an increased demand for fire protection services and increased demand on the region's existing water supply. In the event of a major wildland fire, the potential lack of available fire response staff or adequate response times, or infrastructure constraints such as insufficient water supply, would also contribute to an increased risk of loss, injury and death from wildland fire ignition.

Local jurisdictions' general plan policies and building codes enforce and expand on these requirements at the local level. In addition, local general plans contain policies and programs aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach. To effectively mitigate wildland fire hazards in the San Diego region, a multi-jurisdictional approach that involves federal, State, and local governments and fire agencies is necessary. Collectively, the local jurisdictions and fire agencies work together to prevent the loss of life in wildland fires, the ignition of structures by wildland fires, the encroachment of wildland fire into communities, and a wildfire-caused structural conflagration; as well as limit the size of wildland fires. Also, at the jurisdictional level, the continued monitoring and updating of existing development regulations and plans reinforce the value of defensible space to further reduce the impact of wildfires on people and structures. Finally, public education and firefighter training, support, and emergency operations efforts help reduce the risks of impacts involving wildfires.

The existing laws, regulations, plans, and policies identified in Section 4.19.2, which are aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach, when coupled with the strategies above, would help reduce the risks posed to people and structures associated with wildland fires. However, due to the relatively large area within the San Diego region that is considered at high risk for wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands, regional growth and land use development associated with the proposed Plan would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. This impact would be significant.

Transportation Network Improvements

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to the 2035 analysis, the majority of transportation network improvements that would be implemented between 2036 and 2050 would occur in the highly urbanized western portion of the region; however, portions of this area remain susceptible to wildland fires due to climate, topography, and native vegetation. Using the methodology described above, an estimated 1,287 acres of new transportation network improvements would be developed within FHSZs by 2050. Of the 1,287 acres, new transportation network improvements would occupy approximately 215 and 988 acres of land classified as High and Very High FHSZs, respectively, between 2036 and 2050 (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025).

Construction-related fire hazards associated with transportation network improvements include welding and heavy equipment operation. However, the construction of transportation network improvements in High or Very High FHSZ or the WUI would be subject to the federal, State, and local statutory and regulatory requirements discussed in Section 4.19.2. Compliance with these regulations would reduce the likelihood that construction-related impacts associated with transportation network improvements occur.

Although the majority of transportation improvements between 2036 and 2050 would be focused in the highly urbanized western portion of the region, the proposed Plan also includes new Managed Lanes and Managed Lane

Connectors on SR 52, SR 56, SR 94, SR 125, SR 163, I-15, and I-805, as well as upgrades at certain locations on the LOSSAN Rail Corridor, grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, and double-tracking on the SPRINTER. These improvements would be located in areas prone to wildfire. Areas near human development, especially in the WUI or in areas near campgrounds and roads, generate fires at a more frequent rate than very remote or urban areas (Syphard et al. 2007; Mann et al. 2016; Balch et al. 2017). Common causes of wildfire in the region include equipment use, vehicle fires spreading into wildlands, accidental starts from warming or debris fires, and arson. As shown in Table 4.19-1, when considered over the period of 2019 through 2023 and excluding miscellaneous and undetermined causes, the majority of the fires within the region (approximately 59 percent) were caused by vehicles. Thus, implementation and operation of the transportation network improvements associated with the proposed Plan would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. Impacts would be significant.

2050 Conclusion

Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2036 and 2050 would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. Wildfire ignition risks associated with land use development and transportation network improvements would be exacerbated in areas classified as High and Very High FHSZs and in the WUI, as humans are responsible for most wildfire ignitions. Therefore, the impact (WF-1) would be significant.

Impacts of the Proposed Plan with Future Climate Change

With continued climate change, growth and land use change and transportation network improvements in the region would result in increased risk of wildland fire ignition that would expose additional people and structures to significant risk of loss, injury, or death involving wildland fires. Climate change is expected to result in a longer and less predictable fire season and drive factors that may worsen wildfires, such as more frequent and intense dry Santa Ana winds, drier autumns, and increased development and presence of dead fuels (Kalansky et al. 2018). The proposed Plan would increase development and transportation network improvements in High and Very High FSHZs and the WUI, heightening the risk of ignitions from human sources that would threaten existing development, as well as exposing more people and structures to wildfires.

MITIGATION MEASURES

WF-1 INCREASE RISK OF WILDLAND FIRE IGNITION AND DIRECTLY OR INDIRECTLY EXPOSE PEOPLE OR STRUCTURES TO SIGNIFICANT RISK OF LOSS, INJURY, OR DEATH INVOLVING WILDLAND FIRES.

2035, 2050

WF-1 Reduce Wildfire Risk for Development and Transportation Projects.

During planning, design, and project-level CEQA review of future development and transportation projects located in State Responsibility Areas (SRAs) or Local Responsibility Areas (LRAs) classified by CAL FIRE as High and Very High Fire Hazard Severity Zones (FHSZs), as well as the Wildland-Urban Interface (WUI), SANDAG shall, to the degree allowed by its authority, and other agencies (the County of San Diego, cities, and other local jurisdictions such as fire protection agencies) can and should ensure that project applicants implement measures to reduce wildfire impacts. Such measures include, but are not limited to, the following:

- Reducing the area and density of allowable development, through general plan updates and other processes, within areas mapped by CAL FIRE as High and Very High FHSZs.
- Establishing site-specific safety measures for new development and transportation projects to protect local resources from wildfire. Such measures may include fire hazard identification (e.g., flammable and combustible materials, ignition sources), hazard controls and safeguards (e.g., setbacks, containment),

equipment maintenance, fire protection technology and equipment (e.g., fire alarm, suppression, and shut-off systems), employee/worker training, agency coordination and mutual aid, and other elements.

- Preparing project-specific fire protection plans for new development and transportation projects. Fire protection plans should be developed by the project applicant during project-level CEQA review and identify measures that reduce the risk of structural and human loss from wildfire, such as the use of ignition resistant materials, incorporation of fuel modification techniques and brush clearance, and providing for adequate fire-flow water supply in compliance with applicable fire safety regulations. Fire protection plans should be based on appropriate wildfire modeling that accounts for site-specific conditions related to wildfire.
- Educating residents and businesses regarding local emergency communications and notification systems (e.g., Firewise USA, Community Risk Reduction).
- Adhering to the most current building code requirements for new development and transportation projects, including ignition-resistant construction and inclusion of design features that prevent the intrusion of flames and embers. Fire-resistant features could include ember-resistant vents, fire-resistant roofs, and maintenance of defensible spaces around structures.
- Ensuring sufficient emergency water supply and pressure (local water providers) in accordance with the Emergency Water Standards of the SRA Minimum Fire Safe Regulations (CCR Title 14, Division 1.5, Section 1270 et seq) and most current version of the California Fire Code (CCR Title 24, Part 9) for new projects by working with water management agencies.
- Enforcing state and local defensible space regulations to keep overgrown and unmanaged vegetation, accumulations of trash, and other flammable material away from structures.
- Providing public education about wildfire risk and fire prevention measures, and safety procedures and practices to allow for safe evacuation and/or options to shelter-in-place.
- Planning for and promoting rapid revegetation of burned areas to help prevent erosion and protect bare soils.
- Developing a regulatory mechanism for permitting an aggressive hazardous fuels management program.
- Establishing standards for fuel breaks that can slow or stop a wildfire advancing into a community or into the wildlands. Fuel breaks shall be strategically located to protect a community, structures, or routes of access and egress. Strategic locations may include ridgelines, greenbelts, or other locations to manage embers or support community-level fire suppression tactics.
- SANDAG shall facilitate minimizing future impacts to fire protection services through information sharing regarding fire-wise land management (vegetation data, fire-resistant building materials, locations where development is vulnerable to wildfire, and best practices for safe land management) with county and city planning departments.
- SANDAG, in partnership with technical experts and stakeholders, shall launch or continue existing initiatives to help local cities and counties to protect communities and economies in the San Diego region from disruption as a result of wildfire occurrences. Initiatives could include, but would not be limited to, seminars that review the risk of wildfire and approaches for preparation, including strengthening of infrastructure, emergency services, emergency evacuation plans and reviewing building safety codes.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Mitigation measure WF-1 would reduce this impact by requiring measures to preclude or substantially reduce the risk of wildland fire ignition in High and Very High FHSZs and the WUI. For example, reducing the area and density of allowable development in areas mapped by CAL FIRE as High and Very High FHSZs would reduce the number of people and structures in these fire-prone zones, potentially reduce areas of WUI, and reduce potential sources

of ignition. These measures, in conjunction with the other measures described in mitigation measure WF-1, would reduce the potential for the proposed Plan to exacerbate wildland fire risks. In addition, wildfire ignition risk would be reduced by requiring specific design features for new development per mitigation measure WF-1. However, due to the relatively large area within the San Diego region that is considered at high risk for wildland fires, and because regional growth, land use development, and transportation network improvements could still occur in areas where wildlands are adjacent to urbanized areas and where residences are intermixed with wildlands, the proposed Plan would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. Therefore, this impact (WF-1) would remain significant and unavoidable.

WF-2 DUE TO SLOPE, PREVAILING WINDS, AND OTHER FACTORS, EXACERBATE WILDFIRE RISKS, AND THEREBY EXPOSE PROJECT OCCUPANTS TO POLLUTANT CONCENTRATIONS FROM A WILDFIRE OR THE UNCONTROLLED SPREAD OF A WILDFIRE.

Analysis Methodology

This section analyzes the types of conditions under which the forecasted regional growth and land use change and the planned transportation network improvements of the proposed Plan would exacerbate wildfire risks (i.e., worsen an existing wildfire hazard) due to slope, prevailing winds, and other factors, and thereby expose people to pollution concentrations from a wildfire. Geographic Information System analysis is used to quantify the acreage of projected regional growth and land use change and planned transportation network improvements in High and Very High FHSZs within SRAs and LRAs. CAL FIRE FHSZ mapping considers vegetation, topography (slope), weather (including winds), crown fire potential, and ember production and movement (CAL FIRE 2025b); therefore, these data were used to identify areas likely to have slope, winds, and other factors that could exacerbate fire risks if developed. Acreages were calculated by overlaying the forecast regional growth and land use footprint and the transportation network improvements footprint onto mapped CAL FIRE data for High and Very High FHSZs in the San Diego region. Acres of each footprint that would expand into the High and Very High FHSZs are quantified and identified as areas where wildfire risk could be exacerbated due to slope, prevailing winds, and other factors. In addition, while not quantified, the analysis also considers areas of the region that are currently unclassified (e.g., within an FRA) but are considered wildfire prone based on vegetation, topography, and other factors that influence wildfire.

High and Very High FHSZs are areas in which slopes, prevailing winds, and other factors are conducive to wildfire risk. Where the analysis identifies exacerbated wildfire risks (i.e., instances where existing wildfire hazards are worsened), it then examines whether such exacerbated wildfire risks would expose project occupants to (1) pollutant concentrations from a wildfire or (2) the uncontrolled spread of a wildfire. A significant impact would occur if forecasted regional growth and land use development or planned transportation network improvements would exacerbate wildfire risk and either result in exposure of project occupants to pollutant concentrations from a wildfire or the uncontrolled spread thereof.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Wildfire behavior is a product of several variables—primarily weather, vegetation, topography, and human influences—that intermix to produce local and regional fire regimes that affect how, when, and where fires burn (NPS 2017). The continuity of fuels, expressed in both horizontal and vertical components, is also a determinant of wildfire potential and behavior. Topography is important because it affects the movement of air, which in turn affects the movement of fire, over the ground surface. The slope and shape of terrain can change the speed at which the fire travels, and the ability of firefighters to reach and extinguish the fire. Weather affects the probability of wildfire and has a significant effect on its behavior. Temperature, humidity, and wind (both short- and long-term) affect the severity and duration of wildfires (County of San Diego 2023a).

The San Diego region's topography consists of a semiarid coastal plain and rolling highlands, which, when fueled by shrub overgrowth, occasional Santa Ana winds, and high temperatures, creates an ever-present threat of wildfire. In addition, extended droughts, characteristic of the region's Mediterranean climate and exacerbated by climate change, result in large areas of dry vegetation that provide fuel for wildland fires. Extreme weather conditions, such as high temperatures, low humidity, and winds of extraordinary force, may cause an ordinary fire to expand into one of massive proportions. Wildfire risk tends to be high in locations with dense vegetation, dry conditions, and steep slopes. As such, there is a high wildfire risk in the hills and mountains in the eastern San Diego region where sparse development intermingles with fire-prone native vegetation. However, urban areas can also be at risk where the unique mesa-canyon topography of coastal San Diego puts development in proximity to steep slopes and dense vegetation.

As discussed under WF-1, regional growth and land use development between 2022 and 2035 in wildfire-prone areas of the unincorporated county (i.e., High and Very High FHSZs and WUI) would exacerbate existing wildfire hazards by increasing the risk of wildfire ignition. While most regional growth and land use development would consist of infill, development on the edges of urban areas and in outlying areas could increase the threat of wildland fires on human populations and property, as development may be located closer to and within the WUI and High and Very High FHSZs. In addition, increased development on the edges of urban areas and in outlying areas would expand the WUI by incrementally encroaching into less developed, more highly vegetated areas that may be prone to wildfire. These wildfire hazards would be increased where new development is constructed in areas of the San Diego region with steep topography (e.g., parts of Chula Vista and San Marcos, and canyons in western parts of the County) and strong winds because those conditions contribute to the uncontrolled spread of wildfires and make wildfires more difficult to contain.

In addition to vegetation and structural loss, wildfires also affect public health. Fire-related injuries and deaths are likely to increase as wildfires occur more frequently. Wildfires can also be a significant contributor to air pollution. When communities are located in areas that burn frequently, wildfire smoke, which can travel for miles, has a negative effect on human health (Black et al. 2017). Wildfire smoke contains numerous toxic and hazardous pollutants that are dangerous to breathe and can worsen lung disease and other respiratory conditions (County of San Diego 2023a). Exposure to particulate matter generated by wildfire events can result in significant health problems, including aggravated asthma, increased susceptibility to respiratory infections, and heart attacks and arrhythmias in people with heart disease (Sacramento Metropolitan Air Quality Management District 2018). Thus, the increased risk of wildfire as a result of the proposed Plan would also expose the region's population to harmful pollutant concentrations in the form of smoke from wildfire. Section 4.3, "Air Quality," evaluates human health air quality effects of exposure to particulate matter; the proposed Plan's particulate and related health impacts disclosed in that section would be increased by exposure to wildfire smoke.

The existing laws, regulations, plans, and policies identified in Section 4.19.2, which are aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach, when coupled with the strategies above, would help reduce the risks posed to people and structures associated with wildland fires. However, due to the relatively large area within the San Diego region that is considered at high risk for wildland fires, including areas of the region with steep topography or strong winds, regional growth and land use development associated with the proposed Plan would exacerbate wildfire risk, thereby exposing project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. This impact would be significant.

Transportation Network Improvements

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR 75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the LOSSAN Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

As discussed under WF-1, although the majority of transportation improvements between 2022 and 2035 would be focused in the highly urbanized western portion of the region, the proposed Plan also includes improvements to rural intersections and interchanges on SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. These improvements would be located in areas prone to wildfire. Areas near human development, especially in the WUI or in areas near campgrounds and roads, generate fires at a more frequent rate than very remote or urban areas (Syphard et al. 2007; Mann et al. 2016; Balch et al. 2017). Common causes of wildfire in the region include equipment use, vehicle fires spreading into wildlands, accidental starts from warming or debris fires, and arson. These wildfire hazards would be increased if transportation network improvements implemented under the proposed Plan would be located in areas of the San Diego region with steep slopes and subject to high wind speeds because those conditions contribute to the uncontrolled spread of wildfires and make wildfires more difficult to contain. This would include many of the roadways that extend through the more rural parts of the region, which traverse through areas classified as High and Very High FHSZs and the WUI. In addition, as discussed above, wildfires also affect public health through fire-related injuries and deaths as well as increased air pollution from wildfire smoke. Thus, because implementation and operation of the transportation network improvements associated with the proposed Plan would exacerbate wildfire risk, including in areas where natural conditions make wildfires more difficult to contain, they can expose people to pollutant concentrations from a wildfire and to the uncontrolled spread of wildfire. This impact would be significant.

2035 Conclusion

Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would exacerbate wildfire risk due to development in areas with steep slopes, areas subject to strong winds, and other factors. The increased risk of wildfire as a result of the proposed Plan would also expose the region's population to harmful pollutant concentrations in the form of smoke from wildfire and the uncontrolled spread of wildfire. Therefore, impacts related to the exposure of project occupants to pollutant concentrations from wildfire and the uncontrolled spread of wildfire (WF-2) would be significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050.

As described in the 2035 analysis, new development under the proposed Plan would occur in areas classified as High and Very High FHSZs and the WUI, which would increase the risk of wildfires as humans are responsible for most wildfire ignitions. These wildfire hazards would be increased if new development would be located in areas of the San Diego region with steep topography or subject to strong winds because those conditions contribute to the uncontrolled spread of wildfires and make wildfires more difficult to contain. Consequently, development of land

uses between 2036 and 2050 would exacerbate wildfire risk due to slope, strong winds, and other factors. This exacerbated wildfire risk would also expose the region's population to harmful pollutant concentrations in the form of smoke from wildfire and to the uncontrolled spread of wildfire.

The existing laws, regulations, plans, and policies identified in Section 4.19.2, which are aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach would help reduce the risks posed to people and structures associated with wildland fires. However, due to the relatively large area within the San Diego region that is considered at high risk for wildland fires, including areas of the region with steep topography or strong winds, regional growth and land use development associated with the proposed Plan would exacerbate wildfire risk, thereby exposing project occupants to pollutant concentrations from wildfire and the uncontrolled spread of wildfire. This impact would be significant.

Transportation Network Improvements

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to the 2035 analysis, the majority of transportation network improvements that would be implemented between 2036 and 2050 would occur in the highly urbanized western portion of the region; however, portions of this area remain susceptible to wildland fires due to climate, topography, and native vegetation. Although the majority of transportation improvements between 2036 and 2050 would be focused in the highly urbanized western portion of the region, the proposed Plan also includes new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 94, SR 125, SR 163, I-15, and I-805, as well as upgrades at certain locations on the LOSSAN Rail Corridor, grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, and double-tracking on the SPRINTER. These improvements would be located in areas prone to wildfire. These wildfire hazards would be increased if transportation network improvements implemented under the proposed Plan would be located in areas of the San Diego region with steep slopes and subject to high wind speeds because those conditions contribute to the uncontrolled spread of wildfires and make wildfires more difficult to contain. This would include many of the roadways that extend through the more rural parts of the region, which traverse through areas classified as High and Very High FHSZs and the WUI. In addition, as discussed above, wildfires also affect public health through fire-related injuries and deaths as well as increased air pollution from wildfire smoke.

Thus, because implementation and operation of the transportation network improvements associated with the proposed Plan would exacerbate wildfire risk, including in areas where natural conditions make wildfires more difficult to contain, they can expose people to pollutant concentrations from a wildfire and to the uncontrolled spread of wildfire. This impact would be significant.

2050 Conclusion

Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2036 and 2050 would exacerbate wildfire risk due to slope, strong winds, and other factors. The increased risk of wildfire as a result of regional growth, land use development, and transportation network improvements would also expose the region's population to harmful pollutant concentrations in the form of smoke from wildfire and to the uncontrolled spread of wildfire. High pollutant concentrations can exacerbate other health issues and can contribute to premature deaths. Therefore, impacts related to the exposure of people to pollutant concentrations from wildfire (WF-2) would be significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change and transportation network improvements in the region would result in increased exposure of people to significant risks of pollutant concentrations as a result of wildfire. Wildfire smoke contains gaseous pollutants (e.g., carbon monoxide), hazardous air pollutants (HAPs) (e.g., polycyclic aromatic hydrocarbons [PAHs]), water vapor, and particle pollution (US EPA 2025). Exposure to these pollutants and fine particulate matter ($PM_{2.5}$) can cause mortality and cardiovascular disease and is associated with onset and worsening of respiratory conditions (Law et al. 2025). As climate change exacerbates wildfire risk, $PM_{2.5}$ emissions from wildfires have increased, worsening air quality. The proposed Plan would expand and increase development in the High and Very High FHSZs and WUI, exposing more people to wildfires and resultant increased pollutant concentrations, adversely affecting air quality and public health.

MITIGATION MEASURES

WF-2 DUE TO SLOPE, PREVAILING WINDS, AND OTHER FACTORS, EXACERBATE WILDFIRE RISKS, AND THEREBY EXPOSE PROJECT OCCUPANTS TO POLLUTANT CONCENTRATIONS FROM A WILDFIRE OR THE UNCONTROLLED SPREAD OF A WILDFIRE.

2035, 2050

Implement Mitigation Measure WF-1: Reduce Wildfire Risk for Development and Transportation Projects, as described above.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Mitigation measure WF-1 would reduce this impact by requiring measures to preclude or substantially reduce the risk of wildland fire ignition in High and Very High FHSZs and the WUI. For example, reducing the area and density of allowable development in areas mapped by CAL FIRE as High and Very High FHSZs would reduce the number of people and structures in these fire-prone zones, potentially reduce areas of WUI, and reduce potential sources of ignition. These measures, in conjunction with the other measures described in mitigation measure WF-1, would reduce the potential for the proposed Plan to exacerbate wildland fire risks. In addition, wildfire ignition risk would be reduced by requiring specific design features for new development per mitigation measure WF-1. To the extent that these measures reduce impacts associated with exacerbating wildfire risk, they would also reduce the exposure of County residents to uncontrolled wildfire spread and to harmful pollutant concentrations in the form of wildfire smoke. However, given the relatively large area within the San Diego region considered at high risk for wildland fires and the level of uncertainty regarding the location, frequency, and severity of future wildfires, impacts of exacerbated wildfire risks and the risks associated with wildfire smoke pollution may not be reduced to less than significant. When wildfires occur, weather conditions (e.g., strong winds) usually are such that major portions of the regional population are exposed to dangerous pollution concentrations from wildfire smoke. For these reasons, this impact (WF-2) would remain significant and unavoidable.

WF-3 REQUIRE THE INSTALLATION OR MAINTENANCE OF ASSOCIATED INFRASTRUCTURE (SUCH AS ROADS, FUEL BREAKS, EMERGENCY WATER SOURCES, POWER LINES OR OTHER UTILITIES) THAT MAY EXACERBATE FIRE RISK OR THAT MAY RESULT IN TEMPORARY OR ONGOING IMPACTS TO THE ENVIRONMENT.

Analysis Methodology

This section incorporates the analysis methodology used for WF-1 to evaluate exacerbation of wildfire risks (i.e., worsening an existing wildfire hazard) but focuses on components of future projects under the proposed Plan that include development of public infrastructure and services, such as water sources, power lines, and access roads, required to support regional growth and transportation network projects. The potential to exacerbate wildfire risk or result in temporary impacts on the environment is qualitatively analyzed based on the expected need for

infrastructure, primarily in areas where new development would include expansion of these services. The need for expanded public services and utility infrastructure identified in PS-1 and U-1 in Section 4.15, "Public Services, Recreation, and Utilities" has been considered in the analysis below for WF-3.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, regional growth is forecast to result in an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035. In these cities, higher demand for new utility infrastructure, upgraded systems, and/or expansions would occur, while demand for utilities would also increase throughout the region in response to forecasted growth. In general, regional growth and land use development in urban areas, largely within the LRA as it relates to wildfire risk, would have less demands on utilities than more rural areas that are less comprehensively served by existing utility infrastructure.

The San Diego County Water Authority (SDCWA) has indicated that it has sufficient supply, storage capacity, and delivery capability to satisfy water demands through 2035 (SDCWA 2021). The SDCWA has completed a number of major capital projects in recent years, such as the additional storage capacity at San Vicente Reservoir completed in 2014. In addition, SDCWA's 2024 Master Plan identifies several additional water facility projects to be considered for implementation within the next 10 years through 2035 (see Section 4.18, "Water Supply," for more details). Connections for new water service within the LRA, and often within the SRA, would typically be accomplished via trenching within public rights-of-way (ROW) and installing new water pipelines. There is nothing inherent in the construction or maintenance of water infrastructure that would result in increased risk of wildfire. It is reasonable to assume that fire risks associated with construction activities for water service infrastructure would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific environmental review, as applicable, as well as adherence to existing regulations and best management practices (BMPs) for fire prevention described in Section 4.19.2, above. Specifically, construction activities associated with the installation of new water service infrastructure would be subject to PRC Section 4427, which includes fire safety statutes that restrict the use of equipment that may produce a spark, flame, or fire; require the use of spark arrestors on construction equipment with internal combustion engines; specify requirements for the safe use of gasoline-powered tools in fire hazard areas; and specify fire suppression equipment that must be provided on site for various types of work in fire-prone areas.

Regional population growth would result in an increase in the amount of wastewater generated, especially in the cities of San Diego, San Marcos, and Chula Vista. As discussed in Section 4.15, forecasted growth in 2035 in accordance with the proposed Plan would trigger the need for the provision of new or expanded wastewater treatment facilities and collection systems. Smaller treatment plants throughout the region may reach capacity and may also need to be expanded. Development in existing communities would require expansion or upsizing of existing collection and treatment systems, while development in new areas would require installation of new collection and treatment systems. Development in rural residential areas would also require onsite wastewater treatment facilities, such as septic tanks. The pipelines associated with these new and expanded facilities would be installed underground, typically in the public ROW. As with water infrastructure, there is nothing inherent in the construction or maintenance of wastewater infrastructure that would result in increased risk of wildfire. It is reasonable to assume that fire risks associated with construction activities for wastewater infrastructure would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific

environmental review, as applicable, as well as adherence to the existing regulations and BMPs for fire prevention described in Section 4.19.2, above. This includes the construction-related fire safety requirements provided in PRC Section 4427, as described above for water infrastructure.

As discussed in Section 4.6, "Energy," the region's energy demands will increase along with the region's population. Projected growth would trigger the need for new or expanded energy facilities, including power plants, distributed generation, electrical transmission and distribution infrastructure, and natural gas facilities (e.g., storage, pipelines). The impacts of construction energy-generating facilities could have a range of impacts depending on the facility type, size, and location. The provision of new or expanded energy-generation facilities would result in construction-related impacts. Additional demand for natural gas may also require the construction of new supply, conveyance, storage, and distribution infrastructure. It is reasonable to assume that fire risks associated with construction activities for energy infrastructure would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific environmental review, as applicable, as well as adherence to existing fire prevention regulations and BMPs described in Section 4.19.2, above. This includes the construction-related fire safety requirements provided in PRC Section 4427, as described above for water infrastructure.

Relatedly, additional transmission lines would be needed to meet growing demand for electricity resulting from regional population, housing, and employment growth. Additional facilities would also be needed depending on the location and timing of regional growth and the location of new energy generation facilities. Forecast regional growth and land use development would primarily occur in or adjacent to areas that are already developed and have electricity and natural gas infrastructure in place. This would be particularly the case in the LRA, and to a lesser extent, in the SRA in areas where new development is contiguous to existing development. Although this would reduce the need for construction of new facilities in other areas, the increases in demand for electricity, and development in non-contiguous or topographically constrained areas within the SRA, would potentially create a need for new transmission lines routed across undeveloped land.

The construction and operation of new overhead transmission lines across natural habitat within High or Very High FHSZs or the WUI would exacerbate wildfire risk. Wildfires are often caused along transmission lines from downed lines, direct contact with vegetation, and line faults and equipment failures. Most common are downed lines or arcing between conductors that generates heat and sparks and ignite vegetation (WFCA 2024). Many hundreds of thousands of acres in California alone have been burned as a result of wildfires caused by power line failures in recent years. In the summer of 2018 alone, 17 large wildfires were caused in the state as a result of downed power lines, with the State's deadliest fire, the Camp Fire, occurring in November of that year. The Camp Fire claimed more than 80 lives and destroyed over 18,000 structures (Atkinson 2018, New York Times 2025). In 2019, downed power lines ignited Sonoma County's Kincade Fire, which burned approximately 77,700 acres and destroyed 374 structures (CAL FIRE 2025f). In 2021, the Dixie Fire, also caused by electrical equipment, became the second largest wildfire in California history, burning 963,000 acres north of Chico. The 2021 Dixie Fire, which claimed one life and destroyed 1,311 structures, was the last catastrophic wildfire in California confirmed to be caused by utility equipment (Cal Matters 2024). While still under investigation, radio communications and eyewitness accounts from firefighters responding to the 2025 Eaton Fire suggest that power lines may have sparked new fires after the Eaton Fire initially began (NPR 2025).

Because of the higher potential for fire risk from electrical infrastructure (e.g., power lines in contact with vegetation or hazard trees, sparks from equipment malfunction or failure), electrical utility companies place a high priority on safety during construction and operation (SDG&E 2025a). Common solutions to mitigate fire risk include rigorous vegetation management, use of fire-resistant utility poles, undergrounding distribution lines for resilience, deploying advanced technology for predictive maintenance, implementing strategic planned power outages, and other measures. In addition, new overhead transmission lines in high fire risk areas would be subject to CPUC General Order 95, which governs the design, construction, and maintenance of overhead electrical lines. Rule 31.1 of General Order 95 generally states that design, construction, and maintenance of overhead electrical lines should be done in accordance with accepted good practices for the given location conditions known at the

time by the persons responsible for the design, construction, and maintenance of the overhead electrical lines and equipment (see Section 4.19.2 for the specific requirements of General Order 95).

As part of its ongoing strategy to reduce wildfire risk and the impact of Public Safety Power Shutoffs during adverse weather conditions, SDG&E is currently implementing its Strategic Undergrounding Program. The program was established in 2019 and involves removing existing overhead power lines and placing them underground in areas of the region that are at the greatest risk for wildfires. Specifically, the Strategic Undergrounding Program focuses on HFTD Tier 3 and Tier 2 areas, which consist of areas on the CPUC Fire-Threat Map where there is an extreme and elevated risk, respectively, from wildfires associated with overhead power lines or facilities (see Section 4.19.1 for additional details) (SDG&E 2023). Work associated with the program is anticipated to continue through 2032, with a goal of undergrounding approximately 1,500 miles of powerlines (SDG&E 2025b). As shown in Table 4.19-1, although electrical equipment failure is not one of the primary causes of wildfire in the San Diego region, absent a commitment to underground all future lines serving new development in High and Very High FHSZs and the WUI, new electrical transmission infrastructure would exacerbate the risk of wildfire ignition in the region. Accordingly, impacts related to exacerbating wildfire risks from the installation of infrastructure to serve regional growth and land use change by 2035 would be significant.

Current fire planning in San Diego County does not call for additional fire roads or fuel breaks (County of San Diego Fire Authority 2019); therefore, no impacts from the creation of fire breaks or fire roads are anticipated.

Transportation Network Improvements

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR-75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Utilities serving regional transportation network improvements developed between 2022 and 2035 would consist primarily of electrical lines for signage, signals, and LRT propulsion along with reclaimed water lines for landscape irrigation. These utility lines would be constructed within the transportation facility ROW. Electrical transmission would occur primarily via underground conduit, while water lines for irrigation would similarly be installed underground. Because underground lines would not be exposed to dry vegetation or hazardous trees, and because sparks from failure or malfunction would be contained within underground conduit and vaults, such lines would pose minimal fire risk. In those instances where aboveground electrical facilities are required, such as substations, the facilities would be in urban areas with buffers from any vegetation. Impacts associated with exacerbation of wildfire risk from the installation of these utilities would be less than significant.

2035 Conclusion

Regional growth and land use development between 2022 and 2035 would expand into High and Very High FHSZs, potentially expanding the WUI as a result. This development would require extension and expansion of existing utilities. In instances where utilities are expanding contiguous to existing development, or when utilities are installed underground, which is typically the case in urban areas or for transportation network improvements, there is minimal fire risk as construction activities would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific environmental review, as applicable, as well as adherence to existing fire prevention regulations and BMPs described in Section 4.19.2, above. This includes the construction-related fire safety requirements provided in PRC Section 4427. However, land use development requiring the construction or extension of aboveground electrical transmission lines in High and Very High FHSZs

and the WUI by 2035 would exacerbate the risk of wildfire ignition in the region. Therefore, this impact (WF-3) would be significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the regional population is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units are in the City of San Diego (51.6%), City of Chula Vista (17.1%), and the unincorporated jurisdictions. Similarly, these same three jurisdictions contribute to approximately 70.3% of new jobs between 2036 and 2050. In these cities, higher demand for new utility infrastructure, upgraded systems, and/or expansions would occur, while demand for utilities would also increase throughout the region in response to forecasted growth. Regional growth and land use development in urban areas would have less demands on utilities than more rural areas that are less comprehensively served by existing utility infrastructure.

The horizon for SDCWA's 2024 Master Plan, which plans for the region's water supply, storage, and conveyance infrastructure, is 2045; however, no infrastructure improvement projects are identified for implementation in the 2024 Water Master Plan beyond 2035 (SDCWA 2025). Thus, the need for investment in major water infrastructure beyond this timeframe is unknown. If large-scale water projects are undertaken, it is reasonable to assume that fire risks associated with construction activities would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by SDCWA during project-specific environmental review, as applicable, as well as adherence to existing regulations and BMPs for fire prevention described in Section 4.19.2, above. Specifically, construction activities associated with the installation of new water service infrastructure would be subject to PRC Section 4427, which includes fire safety statutes that restrict the use of equipment that may produce a spark, flame, or fire; require the use of spark arrestors on construction equipment with internal combustion engines; specify requirements for the safe use of gasoline-powered tools in fire hazard areas; and specify fire suppression equipment that must be provided on site for various types of work in fire-prone areas.

In addition, connections for new water service within the LRA, and often within the SRA, would typically be accomplished via trenching within public ROW and installing new water pipelines. Connections to any new development would likely be via underground pipes and would pose minimal fire risk because they would not be exposed to dry vegetation or hazardous trees. There is nothing inherent in the construction or maintenance of water infrastructure that would result in increased risk of wildfire. Similar to large-scale water projects, construction activities associated with new water service connections would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific environmental review and would be subject to the fire safety requirements in PRC Section 4427, described above.

As discussed in Section 4.15, forecasted growth in 2050 in accordance with the proposed Plan would trigger the need for new or expanded wastewater treatment facilities and collection systems. Smaller treatment plants throughout the region may reach capacity and need to be expanded. Minimal development in rural areas is forecast, but development in existing communities would require expansion or upsizing of existing collection and treatment systems. The pipelines associated with these new and expanded facilities would be installed underground, typically in the public ROW. As with water infrastructure, there is nothing inherent in the construction or maintenance of wastewater infrastructure that would result in increased risk of wildfire. It is reasonable to assume that fire risks associated with construction activities for wastewater infrastructure would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific environmental review, as applicable, as well as adherence to the existing regulations and BMPs for fire prevention

described in Section 4.19.2, above. This includes the construction-related fire safety requirements provided in PRC Section 4427, as described above for water infrastructure.

As discussed in Section 4.6, the region's energy demands will increase along with the region's population, which would trigger the need for new or expanded energy facilities. The impacts of construction of these facilities could have a range of impacts depending on the facility type, size, and location. The provision of new or expanded energy-generation facilities would result in construction-related impacts. Additional demand for natural gas may also require the construction of new supply, conveyance, storage, and distribution infrastructure. It is reasonable to assume that fire risks associated with construction activities for energy infrastructure would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific environmental review, as applicable, as well as adherence to existing fire prevention regulations and BMPs described in Section 4.19.2, above. This includes the construction-related fire safety requirements provided in PRC Section 4427, as described above for water infrastructure.

Land use development between 2036 and 2050 would occur primarily in cities and areas contiguous to existing development that are already developed and have electricity and natural gas infrastructure in place. This would be particularly the case in the LRA, and to a lesser extent, in the SRA in areas where new development is contiguous to existing development. Although this would reduce the need for construction of new facilities in other areas, the increases in demand for electricity, and development in non-contiguous or topographically constrained areas within the SRA, would potentially create a need for new transmission lines routed across undeveloped land.

Similar to the 2035 analysis, the construction and operation of new overhead transmission lines across natural habitat within High or Very High FHSZs or the WUI would exacerbate wildfire risk. Wildfires are often caused along transmission lines from downed lines, direct contact with vegetation, and line faults and equipment failures. Most common are downed lines or arcing between conductors that generates heat and sparks and ignite vegetation (WFCA 2024). Because of the higher potential for fire risk from electrical infrastructure (e.g., power lines in contact with vegetation or hazard trees, sparks from equipment malfunction or failure), electrical utility companies place a high priority on safety during construction and operation (SDG&E 2025a). Common solutions to mitigate fire risk include rigorous vegetation management, use of fire-resistant utility poles, undergrounding distribution lines for resilience, deploying advanced technology for predictive maintenance, implementing strategic planned power outages, and other measures. In addition, new overhead transmission lines in high fire risk areas would be subject to CPUC General Order 95, which governs the design, construction, and maintenance of overhead electrical lines. Rule 31.1 of General Order 95 generally states that design, construction, and maintenance of overhead electrical lines should be done in accordance with accepted good practices for the given location conditions known at the time by the persons responsible for the design, construction, and maintenance of the overhead electrical lines and equipment (see Section 4.19.2 for the specific requirements of General Order 95).

As shown in Table 4.19-1, although electrical equipment failure is not one of the primary causes of wildfire in the San Diego region, absent a commitment to underground all future lines serving new development in High and Very High FHSZs and the WUI, new electrical transmission infrastructure would exacerbate the risk of wildfire ignition in the region. Accordingly, impacts related to exacerbating wildfire risks from the installation of infrastructure to serve regional growth and development by 2050 would be significant.

Transportation Network Improvements

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Utilities serving regional transportation network improvements developed between 2036 and 2050 would primarily involve electrical lines for signage, signals, and LRT propulsion, as well as reclaimed water lines for landscape irrigation. These utility lines would be constructed within the transportation facility ROW. Electrical transmission would occur primarily via underground conduit, while water lines for irrigation would similarly be installed underground. Because underground lines would not be exposed to dry vegetation or hazardous trees, and because sparks from failure or malfunction would be contained within underground conduit and vaults, such lines would pose minimal fire risk. In those instances where aboveground electrical facilities are required, such as substations, the facilities would be located in urban areas with buffers from any vegetation. Impacts associated with exacerbation of wildfire risk from the installation of these utilities would be less than significant.

2050 Conclusion

Regional growth and land use development between 2036 and 2050 would expand into High and Very High FHSZs and the WUI. This development would require extension and expansion of existing utilities. In instances where utilities are expanding contiguous to existing development, or when utilities are installed underground as is the typically the case in urban areas or in association with transportation network improvements, there is minimal fire risk as construction activities would be controlled, avoided, or substantially lessened by mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) adopted by the implementing agency during project-specific environmental review, as applicable, as well as adherence to existing fire prevention regulations and BMPs described in Section 4.19.2, above. This includes the construction-related fire safety requirements provided in PRC Section 4427. However, new land development requiring the construction or extension of aboveground electrical transmission lines in High and Very High FHSZs by 2050 would exacerbate the risk of wildfire ignition in the region. Therefore, this impact (WF-3) would be significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change in the region would result in increased fire risk due to installation of new infrastructure. Installation of aboveground electrical distribution infrastructure to support development in the High and Very High FHSZs and WUI, as the proposed Plan identifies, increases the risk of wildfire ignition, such as from downed lines, direct contact with vegetation, and line faults and equipment failures (WFCA 2024), especially in rural and high fire-risk areas. Combined with climate change effects that would increase wildfire risk, this could result in more wildfires in the future.

MITIGATION MEASURES

WF-3 REQUIRE THE INSTALLATION OR MAINTENANCE OF ASSOCIATED INFRASTRUCTURE (SUCH AS ROADS, FUEL BREAKS, EMERGENCY WATER SOURCES, POWER LINES OR OTHER UTILITIES) THAT MAY EXACERBATE FIRE RISK OR THAT MAY RESULT IN TEMPORARY OR ONGOING IMPACTS TO THE ENVIRONMENT.

2035, 2050

Implement Mitigation Measure WF-1: Reduce Wildfire Risk for Development and Transportation Projects, as described above.

WF-3 Reduce Wildfire Risk Related to New or Expanded Infrastructure Required to Support Regional Growth and Land Use Development.

During planning, design, and project-level CEQA review of future development projects located in State Responsibility Areas (SRAs) or Local Responsibility Areas (LRAs) classified by CAL FIRE as High and Very High Fire Hazard Severity Zones (FHSZs), as well as the Wildland-Urban Interface (WUI), (the County of San Diego, cities, other local jurisdictions, and public service and utility providers in the region) can and should ensure that project applicants implement measures to reduce wildfire impacts from new or expanded infrastructure. Such measures include, but are not limited to, the following:

- Establishing site-specific safety measures for new infrastructure and facilities required to provide public services and utilities for new development in order to protect local resources from wildfire. Such measures may include fire hazard identification (e.g., flammable and combustible materials, ignition sources), hazard controls and safeguards (e.g., setbacks, containment), equipment maintenance, fire protection technology and equipment (e.g., fire alarm, suppression, and shut-off systems), employee/worker training, agency coordination and mutual aid, and other elements.
- Preparing project-specific fire protection plans for new infrastructure. Fire protection plans should be developed by the project applicant during project-level CEQA review and identify measures that reduce the risk of structural and human loss from wildfire, such as the use of ignition resistant materials, incorporation of fuel modification techniques and brush clearance, and providing for adequate fire-flow water supply in compliance with applicable fire safety regulations. Fire protection plans should be based on appropriate wildfire modeling that accounts for site-specific conditions related to wildfire.
- Adhering to wildfire safety and mitigation plans established by local utilities companies, including design and construction standards, inspection schedules, and emergency preparedness.
- Adhering to the most current building code requirements for structures related to public services and infrastructure, including ignition-resistant construction and inclusion of design features that prevent the intrusion of flames and embers. Fire-resistant features could include ember-resistant vents, fire-resistant roofs, and maintenance of defensible spaces around structures.
- Ensuring sufficient emergency water supply and pressure (local water providers) in accordance with the Emergency Water Standards of the SRA Minimum Fire Safe Regulations (CCR Title 14, Division 1.5, Section 1270 et seq) and most current version of the California Fire Code (CCR Title 24, Part 9) for new projects.

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Mitigation measure WF-1 would reduce this impact by requiring measures to preclude or substantially reduce wildfire risk in High and Very High FHSZs and the WUI. For example, reducing the area and density of allowable development in areas mapped by CAL FIRE as High and Very High FHSZs would reduce the number of people and structures in these fire-prone zones, potentially reduce areas of WUI, and reduce potential sources of ignition, including those from utility infrastructure to serve new development in fire prone areas. These measures, in conjunction with the other measures described in mitigation measure WF-1, would reduce the potential for the proposed Plan to exacerbate wildland fire risks from the installation of utility infrastructure.

It is reasonable to conclude that mitigation measure WF-3, combined with other mitigation measures (e.g., fire hazard assessment, fire-resistant materials and design, vegetation management) identified during project-level CEQA review conducted by the implementing agency, as well as adherence to existing fire prevention regulations and BMPs identified in Section 4.19.2 (e.g., PRC 4427), above, would be sufficient to reduce impacts related to utility infrastructure construction to a less-than-significant level. However, land development within areas classified as High and Very High FHSZs as well as the WUI would likely require the construction of aboveground electrical transmission lines. Mitigation measure WF-3 would serve to reduce impacts associated with wildfire ignition risks from new electrical infrastructure, but not necessarily to a less-than-significant level given the significant wildfire risk posed by these transmission lines; therefore, this impact (WF-3) would remain significant and unavoidable.

WF-4 EXPOSE PEOPLE OR STRUCTURES TO SIGNIFICANT RISKS, INCLUDING DOWNSLOPE OR DOWNSTREAM FLOODING OR LANDSLIDES, AS A RESULT OF RUNOFF, POST-FIRE SLOPE INSTABILITY, OR DRAINAGE CHANGES.

Analysis Methodology

A significant impact would occur if regional growth and land use changes or transportation network improvements and programs were located in or near SRAs or LRA lands classified as High and Very High FHSZs and would exacerbate wildfire conditions (i.e., worsen an existing wildfire hazard) that would expose people or structures to significant risks related to postfire changes in vegetation and topography. Impacts related to downslope or downstream flooding, landslides, or drainage changes are discussed for areas where regional growth and land use development and transportation network improvements would be located in SRAs or LRAs classified as High and Very High FHSZs, which tend to coincide with areas on steeper slopes and are susceptible to these postfire risks.

Impact Analysis

2035

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2022 to 2035, regional growth is forecast to result in an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). The 2035 regional SCS land use pattern is shown in Figure 2-4. Approximately 93.3% of the forecasted regional population increases between 2022 and 2035 are in the cities of San Diego (51.3%), Chula Vista (26.1%), and San Marcos (15.8%). Those same three jurisdictions would accommodate approximately 71.4% of new housing units in the region between 2022 and 2035, while the cities of San Diego, San Marcos, and Oceanside would accommodate more than 69.5% of new jobs in the region between 2022 and 2035.

Rainfall runoff is enhanced subsequent to wildfire due to changes in soil properties, loss of vegetation cover, and destruction of organic debris on the ground surface. Runoff is accelerated down burned hillslopes compared to unburned hillslopes for two reasons. Surficial soil characteristics are altered when subjected to high temperatures and become water repellant (USGS 2021). Vegetation, which would normally provide resistance to runoff flow and dissipate its energy, is absent. During intense rainfall, post-fire conditions can cause flooding to occur much faster than under normal conditions (hence, "flash" flooding). In the years immediately following a wildfire, accelerated runoff can cause flooding, debris flows, and landslides. In the immediate aftermath of wildfires there is a heightened risk of flash floods due to higher than normal runoff rates. This increases flood waters above what would normally occur with a given rate of precipitation. The more intense rain events predicted as a result of climate change increase the risk of these post-wildfire flash floods. Areas already in or close to flood zones would be at greater risk. Debris flows are common events in Southern California in the aftermath of wildfires. Debris flows are sediment-laden slurries resulting from surface runoff accumulating on hillslopes and channel material such as soil, logs, and boulders as it moves downslope. San Diego County and Southern California, in general, have a history of damaging post-fire debris flows due to the combination of high wildfire frequency, steep terrain covered by high fuel loads, periodic high intensity rainstorms and high population densities. Over the last century, major debris flow events causing widespread damage (destruction of 40 or more structures) and loss of life have occurred on average every 13 years (Kean and Staley 2021). Events causing more localized but still substantial damage occur with more frequency. This has led to the construction of sediment and debris retention basins at the most exposed locations, such as along the southern base of the San Gabriel Mountains.

Study of debris flow events has shown that they are often triggered by high-intensity rainfall events of relatively short duration, and that unlike more typical landslides, they are not dependent on underlying soil saturation (Kean and Staley 2021). The greatest likelihood of a debris flow occurs in the rainy season immediately following the wildfire. A US Geological Survey study covering the larger southwestern study area found that debris flows were triggered by a median 2-year storm event, meaning a storm event that was likely on average to happen every other year (USGS 2021). It has been predicted that, in the event of a severe wildfire followed by an average or

greater storm event, there is a 5 to 12 percent probability of an ensuing debris flow. The USGS has developed an analytical methodology for assessing the risk of damaging floods and resulting debris flows (USGS 2021). This methodology uses watershed terrain and configuration, wildfire burn severity, soil properties, and rainfall characteristics to estimate the probability and volume of debris flows that may occur in response to a 2-year storm. Many such assessments have been conducted in the aftermath of wildfires across the western United States. A problem arises in that these assessments are performed after a wildfire has occurred. In late fire-season wildfires there is often a very short interval between the fire and the onset of winter rains, and the first rain season after the wildfire is the period of highest risk (Kean and Staley 2021; Rengers et al. 2020). This short window combined with the widespread fires occurring in the American West means that most burn areas are not assessed.

Kean and Staley (2021) applied the USGS assessment methodology regionally across all of Southern California. It was found that the areas of most severe risk were at the base of the transverse ranges (i.e., the San Bernardino and San Gabriel Mountains). Virtually all other slopes in Southern California, however, were rated as a moderate to high risk for debris flows, assuming a median intensity wildfire and typical high-intensity rainstorm. They conclude that, with the increasing warming, extended fire season, and higher intensity rainstorms expected as a result of the changing climate, the frequency of debris flows will increase. Virtually all slopes within the High and Very High FHSZs in San Diego County are classified at a moderate to high risk of debris flows (Kean and Staley 2021; Figures 3–5).

Landslides also occur subsequent to wildfires. Unlike debris flows, which most often occur in the rainy season immediately after a wildfire, a study of rainfall-induced landslides in burn areas across Southern California, including several in San Diego County, shows that they are more likely to occur 3 years after the wildfire (Rengers et al. 2020). Rainfall-induced landslides increase in frequency after some vegetation recovery has occurred and the water repellant soil properties present immediately after wildfires have subsided. The above study also monitored a 70-square-kilometer area in the San Gabriel Mountains containing several wildfire burn areas of varying age. This focused area of study confirmed that rainfall-induced landslides are most likely during peak rainfall intensity periods in the midst of protracted storms in the third-year wet season following the wildfire. Landslides are far more likely to occur on south, southwest, and southeast-facing slopes. This is thought to be a result of the sparser vegetation cover present on these slopes compared to north-facing slopes receiving less direct sunlight.

Mapping of known or suspected landslides within San Diego County illustrates that they have occurred across large portions of the County, including within areas designated as High and Very High FHSZs (USGS 2019). Although mapped landslides are widespread throughout the region, areas with mapped known or suspected landslides within High and Very High FHSZs are primarily concentrated in the Otay Ranch area of Chula Vista, El Cajon, Santee, and Poway (see Figure 4.19-3). Using the methodology described above in "Analysis Methodology," an estimated 20,635 acres of new development would occur within FHSZs by 2035. Of this total, approximately 16,400 acres would occur on land classified as a Very High FHSZ, while approximately 2,090 acres would occur in areas classified as a High FHSZ (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025). Portions of this land are on or below slopes that could generate floodwaters, debris flows, or landslides following a wildfire. Increasing levels of severe wildfire occurrence are expected in these areas as a result of the changing climate. At the same time, some individual rain events are expected to be more severe. Development within these areas would face an elevated level of flood risk due to accelerated runoff from previously burned areas. As a result, there would be a high likelihood of damaging debris flows from burned slopes, particularly from slopes that burned during the immediately prior fire season. In the subsequent rainy seasons, a higher likelihood of landslides would be expected in burned areas that are characterized by landslide risk.

As discussed under WF-1, regional growth and land use development between 2022 and 2035 would significantly increase the risk of wildfire ignition. Accordingly, because regional growth and land use development under the proposed Plan would exacerbate wildfire risk, the resultant increased exposure of people and structures to risk of flooding, debris flows, and landslides, as a result of post-fire runoff would be a significant impact.

Transportation Network Improvements

Major transportation network improvements by 2035 include new Managed Lanes and Managed Lane Connectors on SR 15, SR 52, SR 78, SR 125, I-5, I-15, and I-805. The proposed Plan also includes Reversible Managed Lane improvements on SR 75, improvements to rural corridors on SR 67, SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as tolling equipment and Regional Border Management System investments on SR 11. Upgrades at certain locations on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor would be implemented during this period. Other major network improvements include grade separations at certain locations on the SPRINTER, Green line, Blue Line, and Orange Line. Double-tracking is also proposed on the SPRINTER. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

The transportation network improvements that would be implemented between 2022 and 2035 generally would be focused in the highly urbanized western portion of the region, although portions of this area remain susceptible to wildland fires due to climate, topography, and native vegetation as previously discussed. However, the proposed Plan also includes improvements to rural intersections and interchanges on SR 76, SR 79, SR 94, and I-8, as well as interchange and arterial operational improvements on SR 94 and SR 125. These improvements would be located in areas prone to wildfire. Using the methodology described above, an estimated 986 acres of new transportation network improvements would be developed within FHSZs by 2035. Of the 986 acres, new transportation network improvements would occupy approximately 217 and 702 acres of land classified as High and Very High FHSZs, respectively, between 2022 and 2035 (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025).

Post-wildfire debris flows represent a significant hazard for transportation infrastructure. The location and intensity of post-fire debris movements are difficult to predict, and threats can persist for several years until the watershed is restored to pre-fire conditions. The majority of transportation network improvements that would be implemented between 2036 and 2050 would occur in the highly urbanized western portion of the region. In general, transportation projects and facilities are designed and implemented in a manner that does not result in changes in vegetation and topography that, after a wildfire, would increase risks related to downslope or downstream flooding, landslides, or drainage changes. By conducting hydraulic studies before transportation facility design, which would occur during project-specific environmental review, and adhering to requirements for stormwater detention and floodplain regulation, transportation facilities projects typically do not substantially alter pre-project drainage conditions. However, as discussed in WF-1, transportation network improvements would exacerbate wildfire hazards. Accordingly, because transportation network improvements under the proposed Plan would exacerbate wildfire risk, the resultant increased exposure of people and structures to risk of flooding, debris flows, and landslides as a result of post-fire runoff would be a significant impact.

2035 Conclusion

Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would exacerbate wildfire risk that would result in increased exposure of people and structures to risk of flooding, debris flows, and landslides, as a result of post-fire runoff. Therefore, this impact (WF-4) would be significant.

2050

Regional Growth and Land Use Change

As shown in Table 2-1 in Section 2.0 "Project Description," of this Draft EIR, from 2036 to 2050, the regional population is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The 2050 regional SCS land use pattern is shown in Figure 2-5. The majority of the forecasted regional population decrease between 2036 and 2050 is attributed to the unincorporated jurisdictions, the City of Carlsbad, and the City of El Cajon. Approximately 78.8% of new housing units would be developed in the City of San Diego (51.6%), City of Chula Vista (17.1%), and unincorporated jurisdictions. Similarly, these same three jurisdictions would accommodate approximately 70.3% of new jobs between 2036 and 2050.

As described in the 2035 analysis, mapping of known or suspected landslides within San Diego County illustrates that they have occurred across large portions of the County, including within areas designated as High and Very High FHSZs (USGS 2019). Although mapped landslides are widespread throughout the region, mapped known or suspected landslides within High and Very High FHSZs are primarily concentrated in the Otay Ranch area of Chula Vista, El Cajon, Santee, and Poway (see Figure 4.19-3). Using the methodology described above, an estimated 2,608 acres of new development would occur within FHSZs by 2050. Of this total, approximately 2,305 acres would occur on land classified as a Very High FHSZ, while approximately 200 acres would occur in areas classified as a High FHSZ (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025). Although the regional population is forecasted to slightly decrease by 2050, new housing would continue to be developed in the City of San Diego, City of Chula Vista, and the unincorporated jurisdictions.

As discussed under WF-1, regional growth and land use development between 2036 and 2050 would significantly increase the risk of wildfire ignition. Accordingly, because regional growth and land use development under the proposed Plan would exacerbate wildfire risk, the resultant increased exposure of people and structures to risk of flooding, debris flows, and landslides as a result of post-fire runoff would be a significant impact.

Transportation Network Improvements

Major transportation network improvements by 2050 include new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 75, SR 94, SR 125, SR 163, I-15, and I-805, several of which will be a continuation of improvements from 2035. In addition, the proposed Plan includes increased roadway and transit connections to the United States–Mexico border, as well as expansion of and improvements to existing port of entry facilities, which will continue during this period. Upgrades at certain locations on the LOSSAN Rail Corridor would continue during this period. Grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, as well as double-tracking on the SPRINTER would also continue during this period. See Tables 2-7 through 2-10 for a full list of proposed projects by subregion.

Similar to the 2035 analysis, the majority of transportation network improvements that would be implemented between 2036 and 2050 would occur in the highly urbanized western portion of the region; however, portions of this area remain susceptible to wildland fires due to climate, topography, and native vegetation. Using the methodology described above, an estimated 1,287 acres of new transportation network improvements would be developed within FHSZs by 2035. Of the 1,287 acres, new transportation network improvements would occupy approximately 215 and 988 acres of land classified as High and Very High FHSZs, respectively, between 2036 and 2050 (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025).

Although the majority of transportation improvements between 2036 and 2050 would be focused in the highly urbanized western portion of the region, the proposed Plan also includes new Managed Lanes and Managed Lane Connectors on SR 52, SR 56, SR 94, SR 125, SR 163, I-15, and I-805, as well as upgrades at certain locations on the LOSSAN Rail Corridor, grade separations on the SPRINTER, Blue Line, Green Line, and Orange Line, and double-tracking on the SPRINTER. These improvements would be located in areas prone to wildfire.

In general, transportation projects and facilities are designed and implemented in a manner that does not result in changes in vegetation and topography that, after a wildfire, would increase risks related to downslope or downstream flooding, landslides, or drainage changes. By conducting hydraulic studies before transportation facility design, which would occur during project-specific environmental review, and adhering to requirements for stormwater detention and floodplain regulation, transportation facilities projects typically do not substantially alter pre-project drainage conditions. However, as discussed in WF-1, transportation network improvements would exacerbate wildfire hazards. Accordingly, because transportation network improvements under the proposed Plan would exacerbate wildfire risk, the resultant increased exposure of people and structures to risk of flooding, debris flows, and landslides as a result of post-fire runoff would be a significant impact.

2050 Conclusion

Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2036 and 2050 would exacerbate wildfire risk that would result in increased exposure of people and

structures to risk of flooding, debris flows, and landslides, as a result of post-fire runoff. Therefore, this impact (WF-4) from regional growth and land use development would be significant.

Impacts of the Proposed Plan with Future Climate Change

With future climate change, growth and land use change and transportation network improvements in the region would result in the exposure of people or structures to significant risks resulting from runoff, post-fire slope instability, or drainage changes. Climate change is also expected to increase the risk of flooding and landslides in the future due to increased frequency and intensity of extreme precipitation events (Kalansky et al. 2018). Furthermore, climate change would increase the potential for heavy rainfall to occur after wildfire, resulting in potential landslides as flooding washes away soil destabilized from wildfire (Bedsworth et al. 2018). Thus, the proposed Plan could expose more people and structures to increased flooding and landslide risks, risks that are heightened by climate change.

MITIGATION MEASURES

WF-4 EXPOSE PEOPLE OR STRUCTURES TO SIGNIFICANT RISKS, INCLUDING DOWNSLOPE OR DOWNSTREAM FLOODING OR LANDSLIDES, AS A RESULT OF RUNOFF, POST-FIRE SLOPE INSTABILITY, OR DRAINAGE CHANGES.

2035, 2050

WF-4 Reduce Post-Fire Risks Related to Flooding, Landslides, Slope Instability, or Drainage Changes for Development and Transportation Projects.

During planning, design, and project-level CEQA review of future development projects and transportation network improvement projects located in State Responsibility Areas (SRAs) or Local Responsibility Areas (LRAs) classified by CAL FIRE as High and Very High Fire Hazard Severity Zones (FHSZs), as well as the Wildland-Urban Interface (WUI), SANDAG shall, to the degree allowed by its authority, and other agencies (the County of San Diego, cities, and other local jurisdictions) can and should ensure that project applicants implement measures to reduce post-fire impacts. Such measures include, but are not limited to, the following:

- Treating wildfire burned areas using best practices to control stormwater runoff prior to winter rains.
- Restoring wildfire areas by planting native vegetation cover or encouraging the regrowth of native species using best practices as soon as possible to aid in control of stormwater runoff.
- Reducing potential for future flood hazard by removal of dead, woody vegetation along watercourses following a catastrophic fire to reduce the risk of future catastrophic fires.
- Including fire hazard reduction measures (e.g., prescribed burning, vegetation management) that maintain forest health and reduce flood risks when implementing fuel-reducing activities

SIGNIFICANCE AFTER MITIGATION

2035, 2050

Between 2022 and 2050 it is forecast that thousands of acres of land classified as High and Very High FHSZs would be converted from vacant land by land use development and/or transportation network improvements. Climate change is also expected to increase the risk of flooding and landslides in the future due to increased frequency and intensity of extreme precipitation events. Furthermore, climate change may increase the potential for heavy rainfall to occur after wildfire, resulting in potential landslides as flooding washes away soil destabilized from wildfire (Bedsworth et al. 2018). These factors together would greatly increase the risks of flash floods, debris flows, and landslides in the years following wildfires and would likely occur on a scale and in a timeframe that would preclude prevention by implementing mitigation measure WF-4. Because there are no feasible mitigation measures to reduce the increased elevated risk of flash floods, debris flows, and landslides as a result of runoff,

post-fire slope instability, or drainage changes to less than significant, this impact would remain significant and unavoidable.

4.19.5 Cumulative Impacts Analysis

C-WF-1 MAKE A CUMULATIVELY CONSIDERABLE CONTRIBUTION TO ADVERSE EFFECTS RELATED TO WILDFIRE

The area of geographic consideration for cumulative wildfire impacts is the Southern California and northern Baja regions. Large-scale land use changes and improvements to the transportation system influence the regional development pattern, thereby altering the level of exposure of buildings, transportation facilities, and people to the risks posed by wildfire. The most immediate indication of potential wildfire risk is the projected location of new development, either structures or transportation facilities, in areas classified as High and Very High FHSZs. Post-fire slope instability poses a risk in the form of debris flows and landslides. In addition, wildfires pose a significant public health risk due to their air quality impacts from smoke and risk of death or injury.

A projection approach is used for the cumulative analysis of wildfire risk as growth, land use development, and transportation network improvements across the region that can result in the placement of structures and people in High and Very High FHSZs, WUI, and in areas adjacent to slopes posing post-wildfire risks and hazards. The cumulative impact is the combination of the impacts of the proposed Plan and similar impacts identified in adopted plans. Cumulatively considerable impacts related to wildfire would occur if the proposed Plan, when combined with other planning documents, would result in the development of a substantial number of new structures and residents in areas with a high risk of wildfire, such that wildfire risk would increase and/or be exacerbated.

This cumulative impact assessment considers and relies on the impact analysis within this EIR for the proposed Plan and the Southern California Association of Governments (SCAG) 2024-2050 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) Final EIR (SCAG 2024) for the Southern California region, including Los Angeles, Orange County, Riverside, and San Bernardino County. The SCAG 2024-2050 RTP/SCS planning horizon is 2050. Other plans considered in the analysis below include the California-Baja California Border Master Plan, which provides a general land use description of the United States–Mexico border region (Caltrans 2021).

Impacts of the Proposed Plan

The analysis in this EIR concludes that regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires (WF-1). In addition, implementation of the proposed Plan would exacerbate wildfire risk due to slope, prevailing winds, and other factors that would expose people to pollutant concentrations from a wildfire and to the uncontrolled spread of a wildfire (WF-2).

New land use development requiring the construction or extension of aboveground electrical transmission lines in High and Very High FHSZs and the WUI would exacerbate the risk of wildfire ignition in the region (WF-3). Finally, regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would exacerbate wildfire risk that would result in increased exposure of people and structures to risk of flooding, debris flows, and landslides, as a result of post-fire runoff (WF-4).

Impacts of Projections in Adopted Plans

Potential development resulting from implementation of regional plans could occur in wildfire prone areas and could result in additional impacts related to wildfire. SCAG's 2024–2050 RTP/SCS covers all of the other counties in Southern California, i.e., Los Angeles, Orange, Imperial, Riverside, San Bernardino and Ventura. The SCAG 2024-2050 RTP/SCS Final EIR (SCAG 2024) identified significant impacts related to wildfire risk, concluding that development resulting from the plan would be responsible for "exposing occupants to wildfire risks and pollutant

concentrations from wildfire, and exposing people or structures to post-fire slope instability. Wildfires pose a significant public health risk due to their air quality impacts." At the regional scale, the 2024-2050 RTP/SCS Final EIR identified cumulatively significant impacts related to wildfire (SCAG 2024).

Cumulative Impacts and Impact Conclusions

2035

Increase the Risk of Wildland Fire Ignition

A significant cumulative impact in the year 2035 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. It was concluded that the proposed Plan would result in significant impacts related to increasing the risk of wildfire ignition. This impact determination was based on projected land development of approximately 20,635 acres of land within FHSZs. Of this total, a vast majority of new development (approximately 16,400 acres) would occur on land classified as a Very High FHSZ, while approximately 2,090 acres would occur in areas classified as a High FHSZ. In addition, a total of 986 acres of new transportation network improvements would be developed within FHSZs. Of the total 986 acres, new transportation network improvements would occupy approximately 217 and 702 acres of land classified as High and Very High FHSZs, respectively, between 2022 and 2035. The regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. These wildfire ignition risks would be exacerbated in areas classified as High and Very High FHSZs and in the WUI, as humans are responsible for most wildfire ignitions (Syphard et al. 2007; Syphard and Keeley 2015).

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the County, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk that could affect the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2035 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to increased wildfire ignition risk. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows the same conclusion.

Because cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2035 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-1).

Exacerbate Wildfire Risk and Expose Project Occupants to Pollutant Concentrations

A significant cumulative impact in the year 2035 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. It was concluded that the proposed Plan would result in significant impacts related exacerbating wildfire risk. The regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would exacerbate wildfire risk due to slope, strong winds, and other factors. The increased risk of wildfire as a result of the proposed Plan would also expose the region's population to harmful pollutant concentrations in the form of smoke from wildfire and to the uncontrolled spread of a wildfire.

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the County, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk and expose people to

pollutant concentrations in the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2035 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to exacerbation of wildfire risk and exposure of people to pollutant concentrations. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows the same conclusion.

Because cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2035 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-1).

Exacerbate Wildfire Risk from the Installation or Maintenance of Infrastructure

A significant cumulative impact in the year 2035 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. The potential need to extend electrical transmission infrastructure into wildfire prone areas was identified as a significant impact from regional growth and land use development. Regional growth and land development between 2022 and 2035 would expand into High and Very High FHSZs, potentially expanding the WUI as a result. This development would require extension and expansion of existing utilities. Regional growth and land use development requiring the construction or extension of aboveground electrical transmission lines in High and Very High FHSZs and the WUI would exacerbate the risk of wildfire ignition in the region.

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the County, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk from the installation of infrastructure that would affect the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2035 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to the exacerbation of wildfire risk from the installation or maintenance of infrastructure. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows the same conclusion.

Because cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2035 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-1).

Expose People or Structures to Post-Fire Risks

A significant cumulative impact in the year 2035 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. It was concluded that the proposed Plan would result in significant impacts related to post-fire risks posed by potential debris flows, landslides, and drainage changes on nearby slopes. Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2022 and 2035 would exacerbate wildfire risk that would result in increased exposure of people and structures to risk of flooding, debris flows, and landslides, as a result of post-fire runoff.

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the County, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk and expose people or structures to post-fire hazards in the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2035 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to the exposure of people and structures to post-fire risks. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows the same conclusion.

Because cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2035 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-1).

2050

Increase the Risk of Wildland Fire Ignition

A significant cumulative impact in the year 2050 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. It was concluded that the proposed Plan would result in significant impacts related to increasing the risk of wildfire ignition. This impact determination was based on projected land development of a total of approximately 2,608 acres within FHSZs. Of this total, approximately 2,305 acres would occur on land classified as a Very High FHSZ, while approximately 200 acres would occur in areas classified as a High FHSZ. In addition, an estimated 1,287 acres of new transportation network improvements would be developed within FHSZs by 2050. Of the 1,287 acres, new transportation network improvements would occupy approximately 215 and 988 acres of land classified as High and Very High FHSZs, respectively, between 2036 and 2050 (Data downloaded from CAL FIRE and SanGIS in 2025; adapted by Ascent in 2025).

The regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2036 and 2050 would increase the risk of wildland fire ignition that would directly or indirectly expose people and structures to a significant risk of loss, injury, or death involving wildland fires. Wildfire ignition risks would be exacerbated in areas classified as High and Very High FHSZs and in the WUI, as humans are responsible for most wildfire ignitions (Syphard et al. 2007; Syphard and Keeley 2015).

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the county, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk that could affect the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2050 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to increased wildfire ignition risk. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows the same conclusion.

Because cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2050 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-1).

Exacerbate Wildfire Risk and Expose Project Occupants to Pollutant Concentrations

A significant cumulative impact in the year 2050 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. It was concluded that the proposed Plan would result in significant impacts related exacerbating wildfire risk. The regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2036 and 2050 would exacerbate wildfire risk due to slope, strong winds, and other factors. The increased risk of wildfire as a result of the proposed Plan would also expose the region's population to harmful pollutant concentrations in the form of smoke from wildfire and to the uncontrolled spread of a wildfire.

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the county, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk and expose people to

pollutant concentrations in the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2050 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to exacerbation of wildfire risk and exposure of people to pollutant concentrations. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows the same conclusion.

Because cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2050 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-1).

Exacerbate Wildfire Risk from the Installation or Maintenance of Infrastructure

A significant cumulative impact in the year 2050 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. The potential need to extend electrical transmission infrastructure into wildfire prone areas was identified as a significant impact for regional growth and land use development. Regional growth and land development between 2036 and 2050 would expand into High and Very High FHSZs, potentially expanding the WUI as a result. This development would require the extension and expansion of existing utilities. Regional growth and land use development requiring the construction or extension of aboveground electrical transmission lines in High and Very High FHSZs and the WUI would exacerbate the risk of wildfire ignition in the region.

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the county, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk from the installation of infrastructure that would affect the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2050 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to the exacerbation of wildfire risk from the installation or maintenance of infrastructure. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows the same conclusion.

cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2050 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-2).

Expose People or Structures to Post-Fire Risks

A significant cumulative impact in the year 2050 would result if the combined impacts of the proposed Plan and impact projections from the other adopted plan were significant when considered together, even if not independently significant. It was concluded that the proposed Plan would result in significant impacts related to post-fire risks posed by potential debris flows, landslides, and drainage changes on nearby slopes. Regional growth, land use development, and transportation network improvements associated with the proposed Plan between 2036 and 2050 would exacerbate wildfire risk that would result in increased exposure of people and structures to risk of flooding, debris flows, and landslides, as a result of post-fire runoff.

The EIR for the SCAG 2024-2050 RTP/SCS (2024) identified similar project-level and cumulative impacts for six additional counties to the north and east of San Diego County, three of which directly abut the county, including Orange County, Riverside, and Imperial. Because these three counties all contain large areas prone to wildfire, cumulative development in or adjacent to these areas would exacerbate wildfire risk and expose people or structures to post-fire hazards in the Southern California and Northern Baja region. Therefore, the direct and cumulative wildfire impacts from SCAG's adopted 2024-2050 RTP/SCS, when combined with the 2035 wildfire impacts of the proposed Plan, would result in significant cumulative wildfire impacts related to the exposure of people and structures to post-fire risks. While comparable analysis for Baja California is not available, the combination of similar landscape and rapid demographic growth allows a similar conclusion.

Because cumulative wildfire impacts throughout Southern California, and likely the northern Baja region, by 2050 would be significant, and because the proposed Plan's incremental wildfire impacts are significant, the proposed Plan's incremental contribution to cumulative wildfire impacts are cumulatively considerable and therefore significant (Impact C-WF-3).

MITIGATION MEASURES

C-WF-1 DUE TO SLOPE, PREVAILING WINDS, AND OTHER FACTORS, EXACERBATE WILDFIRE RISKS, AND THEREBY EXPOSE PROJECT OCCUPANTS TO POLLUTANT CONCENTRATIONS FROM A WILDFIRE OR THE UNCONTROLLED SPREAD OF A WILDFIRE; OR EXPOSE PEOPLE OR STRUCTURES, EITHER DIRECTLY OR INDIRECTLY, TO A SIGNIFICANT RISK OF LOSS, INJURY OR DEATH INVOLVING WILDLAND FIRES.

2035, 2050

Mitigation measure WF-1 is intended to reduce wildfire risk for development and transportation projects during planning, design, and project-level CEQA review of projects in areas classified as High and Very High FHSZs and the WUI. SANDAG would be required to, and other transportation project sponsors, the County of San Diego, cities, and other local jurisdictions such as fire protection agencies can and should, implement measures to reduce impacts from wildfires. Mitigation measure WF-3 would require that during planning, design, and project-level CEQA review of development projects located in SRAs or in LRAs classified as High and Very High FHSZs and the WUI, that the County of San Diego, cities, other local jurisdictions such as fire protection agencies, and public service and utility providers can and should ensure that project sponsors implement measures to reduce impacts from utility infrastructure. Mitigation measure WF-4 would reduce post-fire risks related to flooding, landslides, slope instability, or drainage changes resulting from development and transportation projects. It would apply to planning, design, and project-level CEQA review of development projects or transportation network improvement projects in areas classified as High and Very High FHSZs and the WUI. Local agencies would ensure that project applicants work with local communities to implement measures to reduce post-fire impacts.

Implementation of mitigation measures WF-1, WF-3, and WF-4 may not reduce all proposed Plan impacts associated with wildfire to a less-than-significant level given the relatively large area within the San Diego region considered at high risk for wildland fires and the level of uncertainty regarding the location, frequency, and severity of future wildfires. In addition, although mitigation measures WF-1, WF-3, and WF-4 identify measures that can and should be implemented by the County of San Diego, cities, other local jurisdictions to reduce significant wildfire impacts, SANDAG lacks the authority to ensure their implementation by these other agencies. Therefore, the proposed Plan's incremental contributions to the cumulative wildfire impacts in years 2035 and 2050 would remain cumulatively considerable post-mitigation.

5 ALTERNATIVES ANALYSIS

This chapter discusses the alternatives to the proposed Plan considered in this EIR and provides an analysis of impacts associated with those alternatives.

5.1 RATIONALE FOR ALTERNATIVES SELECTION

CEQA requires the consideration of alternatives to the proposed Plan and the analysis of impacts associated with those alternatives. By comparing the proposed Plan to the alternatives, the advantages of each can be weighed and analyzed. Section 15126.6(a) of the CEQA Guidelines requires that an EIR "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives."

Additionally, the CEQA Guidelines state the following:

- The specific alternative of "no project" shall also be evaluated along with its impact. If the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives. [Section 15126.6(e)(1), (2)]
- An EIR need not consider every conceivable alternative to a project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives that are infeasible. The range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects. The EIR should briefly discuss the rationale for selecting the alternatives to be discussed. The EIR should also identify any alternatives that were considered by the lead agency but were eliminated from further consideration as infeasible during the scoping process and briefly explain the reasons underlying the lead agency's determination. Among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are (i) failure to meet most of the basic project objectives, (ii) infeasibility, or (iii) inability to avoid significant environmental impacts. [Section 15126.6(a), (c)]
- "Feasible" means capable of being accomplished within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. [Section 15364] Factors taken into account when addressing the feasibility of alternatives include site suitability, economic viability, availability of infrastructure, other plans or regulatory limitations, and jurisdictional boundaries. [Section 15126.6(f)]

CEQA requires identification of alternatives that would avoid or substantially lessen the significant impacts of the proposed Plan. Based on the analysis in Chapter 4, Environmental Impact Analysis, construction and operational activities associated with forecasted regional growth and land use change and planned transportation network improvements and programs under the proposed Plan would result in significant impacts for many resource topics. Of these topics, air quality, greenhouse gas (GHG), and biological resources, transportation and land use impacts were of particular concern to the public during the EIR scoping and planning processes. The comments provided on the Notice of Preparation (NOP), available in Appendix A-2 of this Draft EIR, and during development of the proposed Plan focused on reducing GHG emission and air quality impacts through reductions in vehicle miles traveled (VMT) and land use planning that supported conservation efforts (Appendix A-2). The proposed Plan achieves GHG and VMT reductions by increasing transit utilization and aligning the SCS land use pattern with jurisdiction-specific general plans which concentrate development in urban areas. These strategies also have the effect of reducing other impacts, such as loss of wildlife habitat or agricultural land.

The range of alternatives analyzed in detail in the EIR is in large part based on these public and stakeholder comments. This chapter provides:

- A description of alternatives considered in detail.
- A summary of the environmental impacts of each alternative and a comparison of each alternative's impacts to those of the proposed Plan. The focus of this analysis is to determine if alternatives can avoid or substantially lessen the significant environmental effects of the proposed Plan to a less-than-significant level.
- A discussion of the environmentally superior alternative.
- A discussion of alternatives considered but rejected from detailed analysis.

5.2 ALTERNATIVES CONSIDERED IN DETAIL

Aside from Alternative 1: No Project, the alternatives analyzed in detail are considered potentially feasible for the purposes of CEQA analysis of alternatives to the proposed Plan, although some elements of the alternatives may require major changes in legislation, policy, or in the availability of funding. This analysis focuses on the characteristics that differentiate the alternatives from the proposed Plan.

Appendix M provides the following information to support the analysis of the alternatives:

- Table M-1 provides a list of the "No Build" projects that are assumed to be implemented for the No Project Alternative. No-Build projects are projects that would be built in the region in absence of the 2025 Regional Plan because they are in progress or recently completed.
- Table M-2 provides performance measures data for the proposed Plan and Alternatives Considered in Detail in this EIR, including population, housing, and employment information.
- Table M-3 provides Senate Bill (SB) 375 GHG reduction for Alternatives Considered in Detail in this EIR.
- Table M-4 provides the EMFAC 2017 onroad output summary for Alternatives Considered in Detail in this EIR.

5.2.1 Alternative 1: No Project

CEQA requires a No Project Alternative to be analyzed in the EIR. The No Project Alternatives assumes that the proposed Plan would not be adopted or implemented.

The proposed Plan involves updating the existing plan, the Amended 2021 Regional Plan. The No Project Alternative therefore reflects continuation of the existing plan. [CEQA Guidelines Section 15126.6(e)(3)(A)] The No Project Alternative assumes the Series 15 Regional Growth Forecast with the Amended 2021 Regional Plan land use pattern. Alternative 1 would result in more concentrated development patterns than the proposed Plan because Alternative 1's land use pattern focused growth primarily in mobility hubs, resulting in a denser development pattern than the proposed Plan. he total population, number of housing units, and number of jobs by 2050 would likely be the same as the proposed Plan under this alternative. Table M-2 (Appendix M of this EIR) provides a comparison of the population, housing, and employment for the proposed Plan and the alternatives. The No Project Alternative includes "No Build" transportation projects likely to be implemented if the proposed Plan were not adopted. A list of No-Build projects is included in Appendix M. Future project development and implementation under the No Project Alternative would be limited as SANDAG would fall out of compliance with the state and federal funding requirement of an adopted RTP and SCS in January 2026.

5.2.2 Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions

Alternative 2 incorporates and adapts elements of the proposed Plan, such as the proposed Plan transportation network and many policies and programs. Unlike the proposed Plan, Alternative 2 would include a land use pattern with more focused growth in areas with available multimodal transportation, higher parking pricing than what is included in the proposed Plan, and speed reductions on arterials and freeways not included in the

proposed Plan. This alternative could feasibly accomplish most of the basic objectives of the project and could substantially lessen one or more of the significant effects. This alternative increases mode shift to transit and other non-solo driving transportation modes due to higher parking pricing and reduces GHG emissions due to speed reductions on arterials and freeways. Percent of work trips during peak period for modes other than solo driving increases by 2.7% in 2035 and 3.7% in 2050 for Alternative 2 (see Appendix M). Per capita GHG emissions reductions from 2005 levels are 23.6% in 2035 and 24.6% in 2050 for Alternative 2, compared to 19.32% in 2035 and 19.51% in 2050 for proposed Plan (see Appendix M). Land use in Alternative 2 would focus all growth in areas with available multimodal transportation and expect new growth to only be found in such locations. The land use pattern in Alternative 2 increases capacity for density only in locations with existing multi-family, commercial and office land uses. Alternative 2 includes the same transportation network as the proposed Plan, and funding for Alternative 2 would be the same as described for the proposed Plan. Table 5-1 provides a comparison of the components of each of the alternatives considered in detail.

5.2.3 Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit

Alternative 3 incorporates and adapts elements of the proposed Plan, such as the proposed Plan transportation network and many policies and programs. a land use pattern similar to the proposed Plan that concentrates growth in areas with available multimodal transportation to provide convenient, and increased mode shift to low-VMT options for moving around the region. Unlike the proposed Plan, Alternative 3 would include a land use pattern with more focused growth in areas with available multimodal transportation, higher parking and managed lane pricing policies than what is included in the proposed Plan, and availability of free transit not included in the proposed Plan. This alternative could feasibly accomplish most of the basic objectives of the project and could substantially lessen one or more of the significant effects. This alternative increases mode shift to transit and other non-solo driving transportation modes and reduces GHG emissions due to higher parking pricing, higher managed lane pricing, and access to free transit. Percent of work trips during peak period for modes other than solo driving increases by 2.6% in 2035 and 3.6% in 2050 for Alternative 3 (see Appendix M). Per capita GHG emissions reductions from 2005 are 22% in 2035 and 22.9% in 2050 for Alternative 3, compared to 19.32% in 2035 and 19.51% in 2050 for the proposed Plan (see Appendix M)]. Like Alternative 2, land use in Alternative 3 would focus all growth in areas with available multimodal transportation and expect new growth to only be found in such locations. The land use pattern in Alternative 3 increases capacity for density only in locations with existing multi-family, commercial and office land uses. Alternative 3 includes the same transportation network as the proposed Plan, and funding for Alternative 3 would be the same as described for the proposed Plan. Table 5-1 provides a comparison of the components of each of the alternatives considered in detail.

Table 5-1 Summary of Alternatives Considered in Detail

Components	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
Land Use Pattern	Amended 2021 Regional Plan	Land use pattern focuses new growth in areas with available multimodal transportation	Land use pattern focuses new growth in areas with available multimodal transportation
Transportation Network	"No Build" Projects	Same as proposed Plan	Same as proposed Plan
Parking Pricing	Amended 2021 Regional Plan	Increases parking costs by 100% compared to proposed Plan	Increases parking costs by 100% compared to proposed Plan
Managed Lane Pricing	Amended 2021 Regional Plan	Same as proposed Plan	Increases managed lane pricing by 100% compared to proposed Plan

Components	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
Speed Reductions	No	Reduces speeds on arterials and freeways by 5 mph	No
Free Transit	No	No	Yes
Funding	Committed funding	Same as proposed Plan	Same as proposed Plan

5.2.4 Project Objectives

Alternatives were generated to feasibly attain most of the basic objectives of the proposed Plan. As stated in Chapter 2, these basic objectives are to:

- Focus population and employment growth to protect sensitive habitat and natural resource areas.
- Provide transportation investments that support compact land development patterns and reduce vehicle miles traveled.
- Meet greenhouse gas emissions targets established for the San Diego region by the California Air Resources Board.
- Provide transportation investments and a land use pattern that improves air quality.
- Provide multimodal access to employment centers and key destinations for all communities.
- Enhance the efficiency of the transportation network for moving people and goods through the deployment of new technologies.

Table 5-2 shows that the alternatives considered in detail in this EIR partially or fully meet most of the basic Plan objectives with the exception of Alternative 1: No Project. In this table, a "yes" indicates that an alternative can at least partially, if not fully, meet project objectives.

Table 5-2 Ability for Alternatives Considered in Detail in this EIR to Meet Basic Project Objectives

Project Objectives	Proposed Plan	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
Focus population and employment growth to protect sensitive habitat and natural resource areas.	Yes	Yes	Yes	Yes
Provide transportation investments that support compact land development patterns and reduce vehicle miles traveled.	Yes	No	Yes	Yes
Meet greenhouse gas emissions targets established for the San Diego region by the California Air Resources Board.	Yes	No	Yes	Yes

Project Objectives	Proposed Plan	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
Provide transportation investments and a land use pattern that improves air quality.	Yes	No	Yes	Yes
Provide multimodal access to employment centers and key destinations for all communities.	Yes	No	Yes	Yes
Enhance the efficiency of the transportation network for moving people and goods through the deployment of new technologies.	Yes	No	Yes	Yes

5.3 ALTERNATIVES COMPARISON

Table 5-3 (at the end of this chapter) provides a list of impacts and their significance for Alternatives 1, 2 and 3, with a comparison of the impacts of each alternative to those of the proposed Plan. Calculations for the alternatives analysis are provided in Appendix M of this EIR.

5.4 Environmentally Superior Alternative

Based on the analysis of alternatives provided in Table 5-3, Alternative 2 is the environmentally superior alternative. Although Alternative 2 would not reduce any of the proposed Plan's significant impacts to less than-significant levels, it would reduce many of the proposed Plan's significant impacts. Compared to the proposed Plan's significant impacts, Alternative 2 would have decreased impacts for one or more significance criteria for the following environmental resources: aesthetics and visual resources, agricultural and forestry resources, air quality, biological resources, cultural resources, energy, geology and soils, paleontological resources, greenhouse gas emissions, mineral resources, noise and vibration, public services, recreation, utilities, transportation, tribal cultural resources, water supply, and wildfire. Compared to the proposed Plan's significant impacts, Alternative 2 would have increased impacts for only a few significance criteria for the following resource areas: land use and population and housing.

Among the alternatives, Alternative 2 would achieve the greatest reductions of GHG emissions VMT, and air quality emissions as compared to the proposed Plan. Alternative 2 would result in a 24.6 percent per capita GHG reduction below 2005 levels in 2050, which would result in a greater reduction than the proposed Plan (19.51 percent below 2005 levels in 2050). In addition, Alternative 2 would result in a SB743-based VMT per capita of 14.55 in 2050 compared to VMT per capita of 15.39 VMT under the proposed Plan in 2050 (see Appendix M). SB-743 based VMT per capita reflects non-commercial VMT per resident in the region. In addition, Alternative 2 would result in an increase in SB 375- based total regionwide VMT of 959,729 vehicle miles per day in 2050 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 4,343,189 miles per day in 2050 under the proposed Plan (see Appendix M). Therefore, Alternative 2 would result in decreased impacts as it would achieve a higher VMT reduction than the proposed Plan. Because VMT reductions correlate to GHG reductions, Alternative 2 would result in decreased GHG impacts as compared to the proposed Plan. Alternative 2 would also result in a decrease in reactive organic gases (ROG), nitrous oxides (NO_X), carbon monoxide (CO), fine and respirable particulate matter ($PM_{2.5}$ and PM_{10}), and sulfur oxide (SO_X) emissions compared to the proposed Plan from onroad sources.

5.5 ALTERNATIVES CONSIDERED BUT EXCLUDED FROM FURTHER ANALYSIS

This section discusses several alternatives that were considered by SANDAG decision makers or raised by the public during the planning process for the proposed Plan, or that were raised in public comments on the NOP for the EIR, but were rejected from detailed consideration in this EIR. Reasons for rejecting these alternatives include the following:

- Major elements of the alternative are already included in the proposed Plan or one of the alternatives evaluated in detail in this EIR.
- The alternative is infeasible due to economic, legal, or other considerations.
- The alternative fails to reduce any of the proposed Plan's significant environmental impacts.
- The alternative fails to meet most of the basic project objectives.
- The alternative is for individual project components rather than the proposed Plan as a whole.

SANDAG received several comment letters focused on specific environmental issues, land uses, and individual transportation projects rather than alternatives to the proposed Plan. Those comments are not discussed in this section.

5.5.1 LA PLAYA PLAN

In a January 8, 2023, NOP comment letter, Katheryn Rhodes requested that the proposed Plan include analysis of an alternative La Playa Plan (LPP) for a Full Tidelands Reclamation project, suggesting this alternative would significantly reduce GHG emissions impacts in the SANDAG region. The LPP alternative suggests several projects already included in the proposed Plan (enhanced active transportation corridors and improved fleet connectivity to San Diego International Airport [SDIA] facilities). Funding for the LPP would be subject to confirmation that SDIA is a Grandfathered Airport, which would allow normally restricted Federal Aviation Administration airport revenue to be diverted towards airport transportation projects, including the proposed annexation of port tidelands.

REASONS FOR REJECTION:

The LPP alternative focuses on a limited geographical portion of the region. In addition, most of the major elements of the LPP alternative are already included in the proposed Plan and/or Alternatives 2 and 3 analyzed in this EIR, such as enhanced active transportation corridors and improved fleet connectivity to SDIA facilities.

The LPP alternative is an individual project in a limited geographical portion of the region rather than an alternative for the proposed Plan as a whole, and CEQA does not require analysis of alternatives to individual components of a project (see *California Oak Foundation v. Regents of University of California* (2010) 188 Cal. App. 4th 227, 276–277). Because it is limited, this alternative would not avoid or substantially reduce any of the proposed Plan's significant impacts nor would it meet most of the project objectives. For these reasons, this alternative has been excluded from further consideration.

5.5.2 ACCELERATED PLAN IMPLEMENTATION

As discussed in Section 4.16, Transportation and Section 4.8, Greenhouse Gases, implementation of the proposed Plan would result in significant VMT and GHG impacts. The proposed Plan includes land use growth and transportation improvements that, when implemented, would reduce VMT. However, to further reduce VMT and GHG impacts for years 2035 and 2050, greater transit ridership would need to be achieved earlier than projected. To

accomplish this the implementation of the transportation network improvements in the proposed Plan would need to be accelerated and the projects would need to be constructed sooner than contemplated in the proposed Plan.

REASONS FOR REJECTION:

Funding is not available to accelerate the construction of the proposed Plan. The funding strategy for the proposed Plan considers all reasonably anticipated revenues to be received out to 2050. These funds will come with constraints. A majority of the anticipated funds will be tied to certain types of projects (for example, transit infrastructure or highway operations and maintenance), and SANDAG does not have the authority to interchange them. These constraints include requirements from Congress or the State Legislature, and the investment strategy for the proposed Plan is aligned with those rules. SANDAG is also constrained by when funds will become available over the 25-year life of the proposed Plan. Two thirds of anticipated revenues are not expected to become available until the 2036–2050 timeframe. Accelerating Plan implementation ahead of this timeframe, and in light of the funding constraints, would not allow SANDAG to accomplish the Alternative within a reasonable period of time, taking into account economic and logistical factors. Thus, the Alternative would be infeasible.

For these reasons, this alternative has been excluded from further consideration.

5.5.3 FOCUSED GROWTH, HIGHER PARKING PRICING, AND ROAD USAGE CHARGE

SANDAG received comments during the scoping period about the use of focused growth and pricing to reduce VMT and GHG impacts in the region. As discussed in Section 4.16, Transportation, implementation of the proposed Plan would result in significant VMT and GHG impacts. Therefore, SANDAG evaluated the effect of focused growth, higher parking pricing, and a road usage charge on the proposed Plan's significant impacts.

This analysis includes the proposed Plan transportation network, a land use pattern that concentrates growth in areas with available multimodal transportation to provide convenient, low-VMT options for moving around the region, higher parking pricing than what is included in the proposed Plan, a road usage charge and the same funding availability as the proposed Plan.

REASONS FOR REJECTION:

Major elements of this alternative are already included in Alternatives 2 and 3, evaluated in detail in this EIR. Alternative 2 achieves greater reductions in the proposed Plan's impacts than this alternative and is still environmentally superior to the Focused Growth, Higher Parking Pricing, and Road Usage Charge Alternative. An EIR need not consider additional alternatives that are permutations of alternatives already evaluated in detail. *Village Laguna v. of Laguna Beach, Inc. v. Board of Supervisors* (1982) 134 Cal. App. 3d 1022, 1028.

Similar to Alternatives 2 and 3 analyzed in this EIR, this alternative also meets the project objectives for the proposed Project. However, the combination of focused growth, higher parking pricing, and a road usage charge would not reduce any of the proposed Plan's significant impacts to less-then-significant levels. Regional PM10 emissions would be slightly lower compared to the proposed Plan, but would result in a similar significant impact In addition, GHG emissions would be lower than the proposed Plan, but would not meet the reduction target reference points for 2030, 2045, and 2050 and thus would result in a similar significant impact as the proposed Plan. VMT would also be lower than the proposed Plan, but the alternative would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. This alternative would not avoid or substantially lessen a number of significant environmental impacts of the proposed Plan.

As a financial strategy, higher parking pricing coupled with a road usage charge would provide an additional revenue source for the region. However, the region's residents, including those in disadvantaged communities, would bear these increased costs in addition to other existing economic challenges like the recent rise in inflation.

Compared to the proposed Plan, the percentage of income consumed by out-of-pocket transportation costs would be substantially greater in 2035 and 2050. This makes this alternative undesirable from a policy standpoint, and therefore infeasible.

For these reasons, this alternative has been excluded from further consideration.

5.5.4 WOLFORD BRIEF

In a February 20, 2023, NOP comment letter, Albert Perdon submitted the Wolford Brief as an alternative to the 5 Big Moves of the 2021 Regional Plan and an alternative to the proposed Plan. The Wolford Brief proposes setting new population, housing and economic growth targets for the year 2123 (from 3.4 million people to 9.1 million people), densifying land use including the development of four or more megacities for populations of two million each, developing transit corridors including 200+ mph high-speed train/Maglev plus connected local transit and integrated 24-city/800-mile high-speed trains, building a new integrated airport/high-speed train/housing complex at Miramar, and implementing a benefit assessment-based funding plan. The letter presents the Wolford Brief as an effective alternative to the proposed Plan, suggesting it would significantly reduce VMT and GHG emissions impacts in the SANDAG region.

REASONS FOR REJECTION:

The population and employment projections for the proposed Plan are a forecast rather than a target, as required by state and federal law and regulations (See 23 CFR 450.324 (e) and California Government Code Section 65080(b)(2)(B)(ii)). The Series 15 Growth Forecast meets the legal requirements of SB 375 and aligns with the State of California Department of Finance and the U.S. Census Bureau projections. A full description of the process for developing the Series 15 Growth Forecast population, housing, and jobs numbers can be found in Appendix F to the proposed Plan. SANDAG is legally required to provide a transportation plan for at least a 20-year time horizon consistent with its population and employment forecasts. Implementation of the Wolford Brief Alternative on the proposed 100-year time horizon is remote and speculative, and would be increasingly speculative the further out that SANDAG forecasted. [Guidelines, § 15126.6(f)(3)] Based on the Series 15 Growth Forecast, the population of San Diego County is expected to be 3.4 million by 2050, which is inconsistent with the megacities and supporting transit corridors proposed in the Wolford Brief. The Wolford Brief asks that SANDAG accelerate construction of high speed rail in San Diego County. The proposed Plan does include high speed rail consistent with state planning assumptions.However, SANDAG is not the implementing agency for high speed rail and the Wolford Brief includes high speed rail implementation assumptions that are inconsistent with current state planning assumptions, Therefore, it is not feasible for SANDAG to implement high speed rail in a manner consistent with the Wolford Brief.

The proposed population target upon which the alternative is based is inconsistent with state and federal law and regulations. While this alternative might meet some of the project objectives for the proposed Plan, forecasting population and employment growth for 100 years is remote and speculative. For these reasons, this alternative has been excluded from further consideration.

Table 5-3 provides a list of impacts and their level of significance for Alternatives 1, 2, and 3, with a comparison of the impacts of each alternative to those of the proposed Plan. Calculations for the alternatives analysis are provided in Appendix M of this EIR. The designation “significant impact” in Table 5-3 refers to the level of significance of the impact identified for the proposed Plan as analyzed in this EIR. Within the parentheses is a comparison of the magnitude of the alternative’s impact to the magnitude of the proposed Plan’s impacts (i.e., same, increased, decreased). The level of significance may be the same for the proposed Plan and an alternative for a given threshold, but the impacts from an alternative may be relatively increased or decreased without changing the significance determination.

Table 5-3 Comparison of Alternatives 1, 2, and 3 Impacts to the Proposed Plan Impacts

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Aesthetics and Visual Resources		
2035	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts in 2035 for **AES-1,** substantially adverse effects on scenic vistas; **AES-2,** substantially damage scenic resources, including but not limited to trees, rocks, outcroppings, and historic structures within a state scenic highway; **AES-3,** substantially degrade visual character or quality of public views of the site and its surroundings, including adding a visual element of urban character to an existing rural or open space area, or conflicting with regulations governing scenic quality; and **AES-4,** substantially degrade the existing visual character or quality of public views of the site and its surroundings by creating a new source of substantial light or glare that would adversely affect day or nighttime views. Impacts would be decreased compared to the proposed Plan in 2035 because Alternative 1's land use pattern would be more concentrated in urban areas than the proposed Plan, which would result in less impacts on scenic vistas, scenic resources within scenic highways, visual character in rural and less developed areas of the region, and new sources of substantial light or glare.	**Significant Impact (decreased)** – Impacts **AES-1**, **AES-2**, **AES-3**, and **AES-4** would be significant for Alternative 2 in 2035. Impacts would be reduced compared to the proposed Plan in 2035 because Alternative 2 would result in more compact development patterns compared to the proposed Plan, which would result in reduced impacts on scenic vistas, scenic resources within scenic highways, visual character in rural and less developed areas of the region, and new sources of substantial light or glare.	**Significant Impact (decreased)** – Impacts **AES-1**, **AES-2**, **AES-3**, and **AES-4** would be significant for Alternative 3in 2035. Impacts would be reduced compared to the proposed Plan in 2035 because Alternative 3 would result in more compact development patterns compared to the proposed Plan, which would result in reduced impacts on scenic vistas, scenic resources within scenic highways, visual character in rural and less developed areas of the region, and new sources of substantial light or glare.
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-AES-1**, making a cumulatively considerable contribution to adverse effects related to aesthetics and visual resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-AES-1**, making a cumulatively considerable contribution to adverse effects related to aesthetics and visual resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-AES-1**, making a cumulatively considerable contribution to adverse effects related to aesthetics and visual resources. Cumulative impacts would decrease compared to the proposed Plan.
2050	**Significant Impact (decreased)** – Impacts **AES-1**, **AES-2**, **AES-3**, and **AES-4** would be significant for Alternative 1 in 2050 and decreased compared to the proposed Plan. The rationale described under 2035 also applies to 2050.	**Significant Impact (decreased)** – Impacts **AES-1**, **AES-2, AES-3**, and **AES-4** would be significant for Alternative 2 in 2050 and reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050.	**Significant Impact (decreased)** – Impacts **AES-1**, **AES-2**, **AES-3**, and **AES-4** would be significant for Alternative 3 in 2050 and reduced compared to the proposed Plan. The rationale described under 2035 also applies to 2050.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-AES-1**, making a cumulatively considerable contribution to adverse effects related to aesthetics and visual resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-AES-1**, making a cumulatively considerable contribution to adverse effects related to aesthetics and visual resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-AES-1**, making a cumulatively considerable contribution to adverse effects related to aesthetics and visual resources. Cumulative impacts would decrease compared to the proposed Plan.
	Agriculture and Forestry Resources		
2035	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts on agricultural and forest resources (**AG-1**, **AG-2**, and **FR-1**). **AG-1** would occur due to conversion of agricultural lands to nonagricultural uses, **AG-2** would occur as a result of conflict with land zoned for agricultural use or with Williamson Act contracts, and **FR-1** would result from direct loss of forest land. Impacts would be reduced compared to the proposed Plan in 2035 because Alternative 1 land use would be denser in urban areas than the proposed Plan and would thus result in less conversion of agricultural lands to nonagricultural uses and result in less land use conflicts with agricultural and forest resources.	**Significant Impact (decreased) –** Alternative 2 would result in significant impacts on agricultural and forest resources (**AG-1**, **AG-2**, and **FR-1**). Impacts would be reduced compared to the proposed Plan in 2035 because Alternative 2 land use would be denser in urban areas than the proposed Plan and would thus result in less conversion of agricultural lands to nonagricultural uses and result in less land use conflicts with agricultural and forest resources.	**Significant Impact (decreased) –** Alternative 3 would result in significant impacts on agricultural and forest resources (**AG-1**, **AG-2**, and **FR-1**). Impacts would be reduced compared to the proposed Plan in 2035 because Alternative 3 land use would be denser in urban areas than the proposed Plan and would thus result in less conversion of agricultural lands to nonagricultural uses and result in less land use conflicts with agricultural and forest resources.
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-AG-1**, making a cumulatively considerable contribution to adverse effects on agriculture and forestry resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-AG-1**, making a cumulatively considerable contribution to adverse effects on agriculture and forestry resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-AG-1**, making a cumulatively considerable contribution to adverse effects on agriculture and forestry resources. Cumulative impacts would decrease compared to the proposed Plan.
2050	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts on agricultural and forest resources (**AG-1**, **AG-2**, and **FR-1**) and the impacts would be reduced compared to the proposed Plan. The rationale described under 2035 also applies to 2050.	**Significant Impact (decreased) –** Alternative 2 would result in significant impacts on agricultural and forest resources (**AG-1**, **AG-2**, and **FR-**1) and the impacts would be reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050.	**Significant Impact (decreased) –** Alternative 3 would result in significant impacts on agricultural and forest resources (**AG-1**, **AG-2**, and **FR-**1) and the impacts would be reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-AG-1**, making a cumulatively considerable contribution to adverse effects on agriculture and forestry resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-AG-1**, making a cumulatively considerable contribution to adverse effects on agriculture and forestry resources. Cumulative impacts would decrease compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-AG-1**, making a cumulatively considerable contribution to adverse effects on agriculture and forestry resources. Cumulative impacts would decrease compared to the proposed Plan.
	Air Quality		
2035	**Less-than-Significant Impact (same)** – Alternative 1 would result in a less-than- significant impact in 2035 for **AQ-1,** conflict with or obstruct implementation of applicable Air Quality Attainment Plans. As with the proposed Plan, this alternative would result in population growth that is similar to or less than that assumed in the 2022 RAQS, the 2020 SIP, and the CERP. Therefore, this alternative would be consistent with the 2022 RAQS, the 2020 SIP, and the CERP.	**Less-than-Significant Impact (same)** – Alternative 2 would result in a less-than- significant impact in 2035 for **AQ-1**. As with the proposed Plan, this alternative would result in population growth that is similar to or less than that assumed in the 2022 RAQS, the 2020 SIP, and the CERP. Therefore, this alternative would be consistent with the 2022 RAQS, the 2020 SIP, and the CERP.	**Less-than-Significant Impact (same)** – Alternative 3 would result in a less-than- significant impact in 2035 for **AQ-1**. As with the proposed Plan, this alternative would result in population growth that is similar to or less than that assumed in the 2022 RAQS, the 2020 SIP, and the CERP. Therefore, this alternative would be consistent with the 2022 RAQS, the 2020 SIP, and the CERP.
2035	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2035 for **AQ-2,** result in a cumulatively considerable net increase in nonattainment or attainment criteria pollutants**.** Alternative 1 would increase VMT and on-road emissions compared to the proposed Plan. However, Alternative 1 would result in less emissions (or no change in emissions) than the baseline (2022) conditions for all emission types except for $PM_{2.5}$ and PM_{10}, which would see a marginal increase due to the increase in VMT and associated road dust; refer to Appendix M, Table M-4. Alternative 1 would result in increased emissions of $PM_{2.5}$ and PM_{10} compared to the proposed Plan, an, compared to baseline (2022) conditions. As such, Alternative 1 would also result in a similar but slightly higher significant impact.	**Less-than-Significant Impact (decreased)** – Alternative 2 would result in a less-than-significant impact in 2035 for **AQ-2**. Alternative 2 would decrease VMT and on-road emissions compared to the proposed Plan. Alternative 2 would result in higher VMT but lower emissions than the baseline (2022) conditions. All emission types would decrease relative to both the proposed Plan and baseline (2022) conditions; refer to Appendix M, Table M-4. Therefore, because Alternative 2 would result in reduced emissions compared to the proposed Plan and compared to baseline (2022) conditions, Alternative 2 would have a less-than-significant impact the net increase in nonattainment or attainment criteria pollutants.	**Less-than-Significant Impact (decreased)** – Alternative 3 would result in a less-than- significant impact in 2035 for **AQ-2**. Alternative 3 would decrease VMT and on-road emissions compared to the proposed Plan. Alternative 3 would result in higher VMT and lower emissions than baseline (2022) conditions; refer to Appendix M, Table M-4. Therefore, because Alternative 3 would result in reduced emissions compared to the proposed Plan and compared to baseline (2022) conditions, Alternative 3 would have a less-than-significant impact the net increase in nonattainment or attainment criteria pollutants.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact in 2035 for **AQ-3,** result in construction-related emissions above mass emission thresholds. Alternative 1 would result in decreased construction-related emissions compared to the proposed Plan because fewer transportation projects would be constructed, and would result in decreased impacts.	**Significant Impact (same)** – Alternative 2 would result in a significant impact in 2035 for **AQ-3**. Alternative 2 would result in similar construction-related emissions compared to the proposed Plan because the same number of transportation projects would be constructed, and would result in similar impacts.	**Significant Impact (same)** – Alternative 3 would result in a significant impact in 2035 for **AQ-3**. Alternative 3 would result in similar construction-related emissions compared to the proposed Plan because the same number of transportation projects would be constructed, and would result in similar impacts.
2035	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2035 for **AQ-4,** expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations. As shown in Appendix M, Table M-4, Alternative 1 would result in higher PM_{10} and $PM_{2.5}$ emissions compared to the proposed Plan. Thus, Alternative 1 would have higher PM_{10} and $PM_{2.5}$ concentration impacts on sensitive receptors compared to the proposed Plan and would also result in a similar significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2035 for **AQ-4**, and would expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations. As shown in Appendix M Table M-4, Alternative 2 would result in slightly lower PM_{10} and $PM_{2.5}$ emissions compared to the proposed Plan and the baseline (2022) conditions. Therefore, Alternative 2 would result in a similar but slightly lower significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2035 for **AQ-4**. Alternative 3 would result in a small decrease of PM_{10} and $PM_{2.5}$ emissions compared to the proposed Plan and the baseline (2022) conditions; refer to Appendix M, Table M-4. Therefore, Alternative 3 would result in a similar but slightly lower significant impact.
2035	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2035 for **AQ-5,** expose sensitive receptors to substantial TAC concentrations. As shown in Appendix M Table M-2, Alternative 1 would result in lower transit ridership and increased VMT, which would increase TAC emissions from roadways. Overall, the decrease in diesel exposure due to commuter rail lines due to lower transit demand would be offset by an increase in roadway TACs from increased on-road VMT. Thus, Alternative 1 would have higher TACs compared to the proposed Plan, resulting in a similar significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2035 for **AQ-5**. As shown in Appendix M Table M-2, Alternative 2 would result in increased transit ridership and reduced VMT, which would increase TAC emissions from commuter rail lines but would reduce TAC emissions from roadways. Overall, the increase in diesel exposure from commuter rail lines due to higher transit demand would be offset by a decrease in roadway TACs due to reduced on-road VMT. Thus, Alternative 2 would have lower TACs compared to the proposed Plan, and would result in a similar but slightly lower significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2035 for **AQ-5**. As shown in Appendix M Table M-2, Alternative 3 would result in increased transit ridership and reduced VMT, which would increase TAC emissions from commuter rail lines but would reduce TAC emissions from roadways. Overall, the increase in diesel exposure from commuter rail lines due to higher transit demand would be offset by a decrease in roadway TACs due to reduced on-road VMT. Thus, Alternative 3 would have lower TACs compared to the proposed Plan, and result in a similar but slightly lower significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Less-than-Significant Impact (decreased) –** Alternative 1 would result in a less-than- significant impact in 2035 for **AQ-6,** expose sensitive receptors to substantial concentrations of CO. According to Appendix M, Table M-4, Alternative 1 would result in lower winter CO emissions compared to the proposed Plan, and substantially lower winter CO emissions than the baseline (2022) conditions. Thus, exposure of sensitive receptors to CO concentrations would decrease under Alternative 1 as under the proposed Plan and result in a less-than- significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in a less-than- significant impact in 2035 for **AQ-6**. According to Appendix M, Table M-4, Alternative 2 would result in slightly lower winter CO emissions compared to the proposed Plan, and substantially lower CO emissions than the baseline (2022) conditions. Thus, similar to the proposed Plan, Alternative 2 would have a less-than-significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in a less-than- significant impact in 2035 for **AQ-6**. According to Appendix M, Table M-4, Alternative 3 would result in slightly lower winter CO emissions compared to the proposed Plan, and substantially lower CO emissions than the baseline (2022) conditions. Thus, similar to the proposed Plan, Alternative 3 would have a less-than-significant impact.
2035	**Less-than-Significant Impact (same) –** Alternative 1 would result in a less-than- significant impact in 2035 for **AQ-7,** expose a substantial number of people to objectionable odors. Exposure of people to objectionable odors would be the same as the proposed Plan because Alternative 1 would not result in major increases in construction or operation of typical land uses that cause odor impacts, such as agricultural activities, wastewater treatment plants, food processing plants, chemical plants, composting facilities, landfills, dairies, and fiberglass molding. Furthermore, Alternative 1 would be required to comply with all SDAPCD, city, county, and other odor rules, regulations and programs. Alternative 1 would have similar construction and operational impacts as the proposed Plan and thus similar odor impacts. Thus, Alternative 1 would result in a less-than-significant impact.	**Less-than-Significant Impact (same) –** Alternative 2 would result in a less-than- significant impact in 2035 for **AQ-7**. Exposure of people to objectionable odors would be the same under Alternative 2 as under the proposed Plan because Alternative 2 would use similar construction methods and have similar land uses as the proposed Plan. Furthermore, Alternative 2 would also be required to comply with all SDAPCD, city, county, and other odor rules, regulations and programs. Thus, Alternative 2 would result in similar less-than-significant odor impacts.	**Less-than-Significant Impact (same) –** Alternative 3 would result in a less-than- significant impact in 2035 for **AQ-7**. Exposure of people to objectionable odors would be the same under Alternative 3 as under the proposed Plan because Alternative 3 would use similar construction methods and have similar land uses as the proposed Plan. Furthermore, Alternative 3 would also be required to comply with all SDAPCD, city, county, and other odor rules, regulations and programs. Thus, Alternative 3 would result in similar less-than-significant odor impacts.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts related to **C-AQ-1**, net increase in nonattainment or attainment criteria pollutants (AQ-2); expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations (AQ-4); expose sensitive receptors to substantial TAC concentrations (AQ-5). Cumulative impacts would be increased compared to the proposed Plan. **Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts related to **C-AQ-1**, increase in construction-related emissions (AQ-3). Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same/increased)** – Similar to the proposed Plan, Alternative 1 would not result in cumulatively considerable impacts for **C-AQ-1** related to consistency with plans (AQ-1), exposing sensitive receptors to substantial concentrations of CO (AQ-6), and objectionable odors (AQ-7).	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts related to **C-AQ-1**, expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations (AQ-4); expose sensitive receptors to substantial TAC concentrations (AQ-5). Cumulative impacts would be decreased compared to the proposed Plan. **Cumulatively Considerable (same)** - Alternative 2 would result in a cumulatively considerable impacts related to **C-AQ-1,** increase in construction-related emissions (AQ-3), the same as the proposed Project. **Not Cumulatively Considerable (same/decreased)** – Similar to the proposed Plan, Alternative 2 would not result in cumulatively considerable impacts for **C-AQ-1** related to consistency with plans (AQ-1), net increase in nonattainment or attainment criteria pollutants (AQ-2), exposing sensitive receptors to substantial concentrations of CO (AQ-6), and objectionable odors (AQ-7).	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts related to **C-AQ-1**, expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations (AQ-4); expose sensitive receptors to substantial TAC concentrations (AQ-5). Cumulative impacts would be decreased compared to the proposed Plan. **Cumulatively Considerable (same)** - Alternative 3 would result in a cumulatively considerable impacts related to **C-AQ-1,** increase in construction-related emissions (AQ-3), the same as the proposed Project. **Not Cumulatively Considerable (same/decreased)** – Similar to the proposed Plan, Alternative 3 would not result in cumulatively considerable impacts for **C-AQ-1** related to consistency with plans (AQ-1), net increase in nonattainment or attainment criteria pollutants (AQ-2), exposing sensitive receptors to substantial concentrations of CO (AQ-6), and objectionable odors (AQ-7).
2050	**Less-than-Significant Impact (same)** – Alternative 1 would result in a less-than- significant impact in 2050 for **AQ-1,** conflict with or obstruct implementation of applicable Air Quality Attainment Plans. As with the proposed Plan, this alternative would result in population growth that is similar to or less than that assumed in the 2022 RAQS, the 2020 SIP, and the CERP. Therefore, this alternative would be consistent with the 2022 RAQS, the 2020 SIP, and the CERP.	**Less-than-Significant Impact (same)** – Alternative 2 would result in a less-than- significant impact in 2050 for **AQ-1**. As with the proposed Plan, this alternative would result in population growth that is similar to or less than that assumed in the 2022 RAQS, the 2020 SIP, and the CERP. Therefore, this alternative would be consistent with the 2022 RAQS, the 2020 SIP, and the CERP.	**Less-than-Significant Impact (same)** – Alternative 3 would result in a less-than- significant impact in 2050 for **AQ-1**. As with the proposed Plan, this alternative would result in population growth that is similar to or less than that assumed in the 2022 RAQS, the 2020 SIP, and the CERP. Therefore, this alternative would be consistent with the 2022 RAQS, the 2020 SIP, and the CERP.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2050 for **AQ-2,** result in a cumulatively considerable net increase in nonattainment or attainment criteria pollutants. As shown in Appendix M, Table M-4, Alternative 1 would increase on-road emissions compared to the proposed Plan. However, Alternative 1 would result in less emissions (or no change in emissions) than the baseline (2022) conditions for all emission types except for $PM_{2.5}$ and PM_{10}, which would increase due to the increase in VMT and associated road dust. Therefore, Alternative 1 would result in increased emissions compared to the proposed Plan and, for $PM_{2.5}$ and PM_{10}, compared to baseline (2022) conditions. As such, Alternative 1 would also result in a similar but slightly higher significant impact.	**Less-than-Significant Impact (decreased)** – Alternative 2 would result in a less-than-significant impact in 2050 for **AQ-2**. As shown in Appendix M, Table M-4, Alternative 2 would decrease VMT and on-road emissions compared to the proposed Plan but would result in higher VMT but lower emissions than baseline (2022) conditions. All emission types would decrease relative to both the proposed Plan and baseline (2022) conditions; refer to Appendix M, Table M-4. Therefore, because Alternative 2 would result in reduced emissions compared to the proposed Plan and compared to baseline (2022) conditions, Alternative 2 would have a less-than-significant impact the net increase in nonattainment or attainment criteria pollutants.	**Less-than-Significant Impact (decreased)** – Alternative 3 would result in a less-than- significant impact in 2050 for **AQ-2**. As shown in Appendix M, Table M-4, Alternative 3 would decrease VMT and on-road emissions compared to the proposed Plan. Alternative 3 would result in higher VMT and lower emissions the baseline (2022) conditions. Therefore, Alternative 3 would result in reduced emissions compared to the proposed Plan and compared to baseline (2022) conditions, Alternative 3 would have a less-than-significant impact the net increase in nonattainment or attainment criteria pollutants.
2050	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact in 2050 for **AQ-3,** result in construction-related emissions above mass emission thresholds. Alternative 1 would result in lower construction-related emissions compared to the proposed Plan because fewer transportation projects would be constructed, and would result in decreased impacts.	**Significant Impact (same)** – Alternative 2 would result in a significant impact in 2050 for **AQ-3**. Alternative 2 would result in similar construction-related emissions compared to the proposed Plan because the same number of transportation projects would be constructed, and would result in similar impacts.	**Significant Impact (same)** – Alternative 3 would result in a significant impact in 2050 for **AQ-3**. Alternative 3 would result in similar construction-related emissions compared to the proposed Plan because the same number of transportation projects would be constructed, and would result in similar impacts.
2050	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2050 for **AQ-4**. As shown in Appendix M, Table M-4, Alternative 1 would result in higher PM_{10} and $PM_{2.5}$ emissions compared to the proposed Plan. Thus, Alternative 1 would also result in a similar, but slightly increased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2050 for **AQ-4**. As shown in Appendix M, Table M-4, Alternative 2 would result in lower PM_{10} and $PM_{2.5}$ emissions compared to the proposed Plan. Thus, Alternative 2 would have a similar, but slightly decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2050 for **AQ-4**. Alternative 3 would result in a small decrease of PM_{10} and $PM_{2.5}$ emissions compared to the proposed Plan; refer to Appendix M, Table M-4. Thus, Alternative 3 would have a similar, but slightly decreased, significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2050 for **AQ-5**. As shown in Appendix M Table M-2, Alternative 1 would result in lower transit ridership and increased VMT, which would increase TAC emissions from roadways. Overall, while diesel exposure due to commuter rail lines would decrease due to lower transit demand, this would be offset by an increase in roadways TACs due to increased on-road VMT. Thus, Alternative 1 would have higher TACs compared to the proposed Plan, resulting in a similar significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2050 for **AQ-5**. As shown in Appendix M Table M-2, Alternative 2 would result in increased transit ridership and reduced VMT, which would increase TAC emissions from commuter rail lines but would reduce TAC emissions from roadways. Overall, decrease in diesel exposure from commuter rail lines due to higher transit demand would be offset by a decrease in roadway TACs due to reduced on-road VMT. Thus, Alternative 2 would have lower TACs compared to the proposed Plan, resulting in a similar significant impact.	**Significant Impact (decreased**) – Alternative 3 would result in a significant impact in 2050 for **AQ-5**. As shown in Appendix M Table M-2, Alternative 3 would result in increased transit ridership and reduced VMT, which would increase TAC emissions from commuter rail lines but reduce TAC emissions from roadways. Overall, decrease in diesel exposure from commuter rail lines due to higher transit demand would be offset by a decrease in roadway TACs due to reduced on-road VMT. Thus, Alternative 3 would have lower TACs compared to the proposed Plan, resulting in a similar significant impact.
2050	**Less-than-Significant Impact (decreased) –** Alternative 1 would result in a less-than- significant impact in 2050 for **AQ-6**. According to Appendix M, Table M-4, Alternative 1 would result in lower winter CO emissions than the proposed Plan, and substantially lower winter CO emissions than baseline (2022) conditions. Thus, exposure of sensitive receptors to CO concentrations would decrease under Alternative 1 and would result in a less-than- significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in a less-than-significant impact in 2050 for **AQ-6**. According to Appendix M, Table M-4, Alternative 2 would result in lower winter CO emissions than the proposed Plan, and substantially lower winter CO emissions than baseline (2022) conditions. Thus, exposure of sensitive receptors to CO concentrations under Alternative 2 would result in a less-than-significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in a less-than- significant impact in 2050 for **AQ-6**. According to Appendix M, Table M-4, Alternative 3 would result in lower winter CO emissions than the Proposed Plan, and substantially lower winter CO emissions than baseline (2022) conditions. Thus, exposure of sensitive receptors to CO concentrations under Alternative 3 would result in a less- than-significant impact.
2050	**Less-than-Significant Impact (same)** – Alternative 1 would result in a less-than-significant impact in 2050 for **AQ-7**. Exposure of people to objectionable odors would be the same as the proposed Plan because Alternative 1 would not result in major increases in construction or operation of typical land uses that cause odor impacts, such as agricultural activities, wastewater treatment plants, food processing plants, chemical plants, composting facilities, landfills, dairies, and fiberglass molding. Furthermore, Alternative 1 would be required to comply with all SDAPCD, city, county, and other odor rules, regulations and programs. Alternative 1 would have similar construction and operational impacts as the proposed Plan and thus similar odor impacts. Thus, Alternative 1 would result in a less-than- significant impact.	**Less-than-Significant Impact (same)** – Alternative 2 would result in a less-than-significant impact in 2050 for **AQ-7**. Exposure of people to objectionable odors would be the same under Alternative 2 as under the proposed Plan because Alternative 2 would use similar construction methods and have similar land uses. Furthermore, Alternative 2 would also be required to comply with all SDAPCD, city, county, and other odor rules, regulations and programs. Thus, Alternative 2 would result in similar less-than-significant odor impacts.	**Less-than-Significant Impact (same)** – Alternative 3 would result in a less-than- significant impact in 2050 for **AQ-7**. Exposure of people to objectionable odors would be the same under Alternative 3 as under the proposed Plan because Alternative 3 would use similar construction methods and have similar land uses. Furthermore, Alternative 3 would also be required to comply with all SDAPCD, city, county, and other odor rules, regulations and programs. Thus, Alternative 3 would result in similar less-than-significant odor impacts.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts related to **C-AQ-1**, net increase in nonattainment or attainment criteria pollutants (AQ-2); expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations (AQ-4); expose sensitive receptors to substantial TAC concentrations (AQ-5). Cumulative impacts would be increased compared to the proposed Plan. **Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts related to **C-AQ-1**, increase in construction-related emissions (AQ-3). Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same/decreased)** – Similar to the proposed Plan, Alternative 1 would not result in cumulatively considerable impacts for **C-AQ-1** related to consistency with plans (AQ-1), exposing sensitive receptors to substantial concentrations of CO (AQ-6), and objectionable odors (AQ-7).	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts related to **C-AQ-1**, expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations (AQ-4); expose sensitive receptors to substantial TAC concentrations (AQ-5). Cumulative impacts would be decreased compared to the proposed Plan. **Cumulatively Considerable (same)** - Alternative 2 would result in cumulatively considerable impacts related to **C-AQ-1,** increase in construction-related emissions (AQ-3), the same as the proposed Project. **Less than Cumulatively Considerable (same/decreased)** – Similar to the proposed Plan, Alternative 2 would not result in cumulatively considerable impacts for **C-AQ-1** related to consistency with plans (AQ-1), net increase in nonattainment or attainment criteria pollutants (AQ-2), exposing sensitive receptors to substantial concentrations of CO (AQ-6), and objectionable odors (AQ-7).	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts related to **C-AQ-1**, expose sensitive receptors to substantial PM_{10} and $PM_{2.5}$ concentrations (AQ-4); expose sensitive receptors to substantial TAC concentrations (AQ-5). Cumulative impacts would be decreased compared to the proposed Plan. **Cumulatively Considerable (same)** - Alternative 3 would result in cumulatively considerable impacts related to **C-AQ-1,** increase in construction-related emissions (AQ-3), the same as the proposed Project. **Less than Cumulatively Considerable (same/decreased)** – Similar to the proposed Plan, Alternative 3 would not result in cumulatively considerable impacts for **C-AQ-1** related to consistency with plans (AQ-1), net increase in nonattainment or attainment criteria pollutants (AQ-2), exposing sensitive receptors to substantial concentrations of CO (AQ-6), and objectionable odors (AQ-7).
	Biological Resources		
2035	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts on biological resources for **BIO-1**, adverse effects on sensitive natural communities and regulated aquatic resources; **BIO-2**, adverse effects on candidate, sensitive, endangered, rare, threatened, or special status species; and **BIO-3**, substantial interference with wildlife movement. The impacts of Alternative 1 in 2035 would be reduced compared to the proposed Plan because Alternative 1 would result in more concentrated development patterns, which would reduce impacts on natural communities, plant and animal species, and wildlife movement. As such, Alternative 1 would also result in a similar but decreased significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on biological resources for **BIO-1**, **BIO-2**, and **BIO-3**. The impacts of Alternative 2 in 2035 would be reduced compared to the proposed Plan because Alternative 2 would result in more concentrated development patterns, which would reduce impacts on natural communities, plant and animal species, and wildlife movement. As such, Alternative 2 would also result in a similar but decreased significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on biological resources for **BIO-1**, **BIO-2**, and **BIO-3**. The impacts of Alternative 3 in 2035 would be reduced compared to the proposed Plan because Alternative 3 would result in more compact development patterns, which would reduce impacts on natural communities, plant and animal species, and wildlife movement. As such, Alternative 3 would also result in a similar but decreased significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Less-than-Significant Impact (decreased) –** Alternative 1 would result in a less-than-significant impact in 2035 for **BIO-4,** conflict with the provisions of an adopted HCP, NCCP, or other conservation plan, or with any local policies or ordinances protecting biological resources**.** Encroachment into NCCP preserve areas from regional growth and land use change, and, to a lesser extent, transportation network improvements, would require biologically equivalent or superior compensation of habitat or project redesign, the same as the proposed Plan. Therefore, due to more concentrated development, Alternative 1 would result in reduced impacts compared to the proposed Plan.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in a less-than-significant impact in 2035 for **BIO-4**. Encroachment into NCCP preserve areas from regional growth and land use change, and, to a lesser extent, transportation network improvements, would require biologically equivalent or superior compensation of habitat or project redesign, the same as the proposed Plan. Therefore, due to more concentrated development, Alternative 2 would result in reduced impacts compared to the proposed Plan.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in a less-than-significant impact in 2035 for **BIO-4**. Encroachment into NCCP preserve areas from regional growth and land use change, and, to a lesser extent, transportation network improvements, would require biologically equivalent or superior compensation of habitat or project redesign, the same as the proposed Plan. Therefore, due to more concentrated development, Alternative 3 would result in decreased impacts compared to the proposed Plan.
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-BIO-1**, a cumulatively considerable contribution to adverse effects on biological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-BIO-1** in 2035 for BIO-4, conflict with the provisions of an adopted HCP, NCCP, or other conservation plan, or with any local policies or ordinances protecting biological resources.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-BIO-1**, a cumulatively considerable contribution to adverse effects on biological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-BIO-1** in 2035 for BIO-4, conflict with the provisions of an adopted HCP, NCCP, or other conservation plan, or with any local policies or ordinances protecting biological resources.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-BIO-1**, a cumulatively considerable contribution to adverse effects on biological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-BIO-1** in 2035 for BIO-4, conflict with the provisions of an adopted HCP, NCCP, or other conservation plan, or with any local policies or ordinances protecting biological resources.
2050	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact on biological resources for **BIO-1**, **BIO-2**, and **BIO-3**. The impacts of Alternative 1 in 2050 would be reduced compared to the proposed Plan because Alternative 1 would result in more concentrated development patterns, which would reduce impacts on natural communities, plant and animal species, and wildlife movement. As such, Alternative 1 would also result in a similar but decreased significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on biological resources for **BIO-1**, **BIO-2**, and **BIO-3**. The impacts of Alternative 2 in 2050 would be reduced compared to the proposed Plan because Alternative 2 would result in more concentrated development patterns, which would reduce impacts on natural communities, plant and animal species, and wildlife movement. As such, Alternative 2 would also result in a similar but decreased significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on biological resources for **BIO-1**, **BIO-2**, and **BIO-3**. The impacts of Alternative 3 in 2050 would be reduced compared to the proposed Plan because Alternative 3 would result in more concentrated development patterns, which would reduce impacts on natural communities, plant and animal species, and wildlife movement. As such, Alternative 3 would also result in a similar but decreased significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Less-than-Significant Impact (decreased) –** Alternative 1 would result in a less-than-significant impact in 2050 for **BIO-4**. Encroachment into NCCP preserve areas from regional growth and land use change, and, to a lesser extent, transportation network improvements, would require biologically equivalent or superior compensation of habitat or project redesign, the same as the proposed Plan. Therefore, due to more compact development, Alternative 1 would result in reduced less than significant impacts compared to the proposed Plan.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in a less-than-significant impact in 2050 for **BIO-4**. Encroachment into NCCP preserve areas from regional growth and land use change, and, to a lesser extent, transportation network improvements, would require biologically equivalent or superior compensation of habitat or project redesign, the same as the proposed Plan. Therefore, due to more compact development, Alternative 2 would result in reduced less than significant impacts compared to the proposed Plan.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in a less-than-significant impact in 2050 for **BIO-4**. Encroachment into NCCP preserve areas from regional growth and land use change, and, to a lesser extent, transportation network improvements, would require biologically equivalent or superior compensation of habitat or project redesign, the same as the proposed Plan. Therefore, due to more compact development, Alternative 3 would result in reduced less than significant impacts compared to the proposed Plan.
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-BIO-1**, a cumulatively considerable contribution to adverse effects on biological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-BIO-1** in 2050 for BIO-4, conflict with the provisions of an adopted HCP, NCCP, or other conservation plan, or with any local policies or ordinances protecting biological resources.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-BIO-1**, a cumulatively considerable contribution to adverse effects on biological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-BIO-1** in 2050 for BIO-4, conflict with the provisions of an adopted HCP, NCCP, or other conservation plan, or with any local policies or ordinances protecting biological resources.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-BIO-1**, a cumulatively considerable contribution to adverse effects on biological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-BIO-1** in 2050 for BIO-4, conflict with the provisions of an adopted HCP, NCCP, or other conservation plan, or with any local policies or ordinances protecting biological resources.
	Cultural Resources		
2035	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact on cultural resources for **CULT-1,** substantial adverse change in the significance of a historical resource or unique archaeological resource. The impacts of Alternative 1 in 2035 would be reduced compared to the proposed Plan. Alternative 1's land use pattern would be more concentrated compared to the proposed Plan, resulting in fewer ground-disturbing activities on previously undisturbed land that could encounter and adversely affect historical or archaeological resources. Therefore, Alternative 1 would result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on cultural resources for **CULT-1**. The impacts of Alternative 2 in 2035 would be reduced compared to the proposed Plan because Alternative 2's land use pattern would be more concentrated compared to the proposed Plan, resulting in fewer ground-disturbing activities on previously undisturbed land that could encounter and adversely affect historical or archaeological resources. Therefore, Alternative 2 would result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on cultural resources for **CULT-1**. The impacts of Alternative 3 in 2035 would be reduced compared to the proposed Plan because Alternative 3's land use pattern would be more concentrated compared to the proposed Plan, resulting in fewer ground-disturbing activities in previously undisturbed land that could encounter and adversely affect historical or archaeological resources. Therefore, Alternative 3 would result in a similar, but decreased, significant impact compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Less-than-Significant Impact (same) –** Alternative 1 would result in a less-than-significant impact in 2035 for **CULT-2,** disturb any human remains, including those interred outside of dedicated cemeteries, in violation of existing laws and regulations. Existing laws and regulations would continue to apply to Alternative 1, so the impact would be the same as the proposed Plan impact.	**Less-than-Significant Impact (same) –** Alternative 2 would result in a less-than-significant impact in 2035 for **CULT-2**. Existing laws and regulations would continue to apply to Alternative 2, so the impact would be the same as the proposed Plan impact.	**Less-than-Significant Impact (same) –** Alternative 3 would result in a less-than-significant impact in 2035 for **CULT-2**. Existing laws and regulations would continue to apply to Alternative 3, so the impact would be the same as the proposed Plan impact.
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-CULT-1**, a cumulatively considerable contribution to adverse effects on cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-CULT-1**, a cumulatively considerable contribution to adverse effects on cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-CULT-1**, a cumulatively considerable contribution to adverse effects on cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.
2050	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact on cultural resources for **CULT-1**. The impacts of Alternative 1 in 2050 would be decreased compared to the proposed Plan because the land use pattern would be more concentrated, which would result in fewer ground-disturbing activities in previously undisturbed land that could encounter and adversely affect historical or archaeological resources. Therefore, Alternative 1 would result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on cultural resources for **CULT-1**. The impacts of Alternative 2 in 2050 would be decreased compared to the proposed Plan because the land use pattern would be more concentrated, which would result in fewer ground-disturbing activities in previously undisturbed land that could encounter and adversely affect historical or archaeological resources. Therefore, Alternative 2 would result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on cultural resources for **CULT-1**. The impacts of Alternative 3 in 2050 would be decreased compared to the proposed Plan because the land use pattern would be more concentrated, which would result in fewer ground-disturbing activities in previously undisturbed land that could encounter and adversely affect historical or archaeological resources. Therefore, Alternative 3 would result in a similar, but decreased, significant impact compared to the proposed Plan.
2050	**Less-than-Significant Impact (same) –** Alternative 1 would result in a less-than-significant impact in 2050 for **CULT-2**. Existing laws and regulations would continue to apply to Alternative 1, so the impact would be the same as the proposed Plan impact.	**Less-than-Significant Impact (same) –** Alternative 2 would result in a less-than-significant impact in 2050 for **CULT-2**. Existing laws and regulations would continue to apply to Alternative 2, so the impact would be the same as the proposed Plan impact.	**Less-than-Significant Impact (same) –** Alternative 3 would result in a less-than-significant impact in 2050 for **CULT-2**. Existing laws and regulations would continue to apply to Alternative 3, so the impact would be the same as the proposed Plan impact.
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-CULT-1**, a cumulatively considerable contribution to adverse effects on cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-CULT-1**, a cumulatively considerable contribution to adverse effects on cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-CULT-1**, a cumulatively considerable contribution to adverse effects on cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Energy		
2035	**Less-than-Significant Impact (increased) –** Alternative 1 would result in a less-than-significant impact in 2035 for (**EN-1),** result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy during project construction or operations. Existing State and regional regulations and programs to reduce energy use would continue to apply to Alternative 1; however, land use would concentrate more new growth in areas with available multimodal transportation than the proposed Plan, resulting in more efficient energy usage for transportation during project operations. Thus, Alternative 2 would result in decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in a less-than-significant impact in 2035 (**EN-1**). Existing State and regional regulations and programs to reduce energy use would continue to apply to Alternative 2; however, land use would concentrate more new growth in areas with available multimodal transportation than the proposed Plan, resulting in more efficient energy usage for transportation during project operations. Alternative 2 would result in more efficient energy usage from incentives to use transit as compared to the proposed Plan, thus decreasing reliance on gasoline and diesel fuel to power automobiles. Thus, Alternative 2 would result in decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in a less-than-significant impact in 2035 (**EN-1**). Existing State and regional regulations and programs to reduce energy use would continue to apply to Alternative 3; however, the land use pattern would be more concentrated as compared to the proposed Plan. Alternative 3 would also concentrate more new growth in areas with available multimodal transportation than the proposed Plan, resulting in more efficient energy usage for transportation during project operations. Moreover, the free transit component of Alternative 3 could incentivize increased reliance on transit leading to decreased energy per capita for on-road transportation as compared to the proposed Plan. This could occur as gasoline and diesel fuel consumption associated with on-road vehicles shifts to transit, which may be powered by electricity or condensed natural gas. Thus, Alternative 3 would result in decreased, less-than-significant impacts.
2035	**Less-than-Significant Impact (same) –** Alternative 1 would result in a less-than-significant impact in 2035 for **EN-2,** conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Alternative 1 would be consistent with adopted plans to address energy efficiency and renewable energy and thus would result in the same less-than-significant impact as the proposed Plan.	**Less-than-Significant Impact (same) –** Alternative 2 would result in a less-than-significant impact in 2035 (**EN-2**). Alternative 2 would be consistent with adopted plans to address energy efficiency and renewable energy and thus would result in the same less-than-significant impact as the proposed Plan.	**Less-than-Significant Impact (same) –** Alternative 3 would result in a less-than-significant impact in 2035 (**EN-2**). Alternative 3 would be consistent with adopted plans to address energy efficiency and renewable energy and thus would result in the same less-than-significant impact as the proposed Plan.
2035	**Not Cumulatively Considerable (decreased)** - Alternative 1 would not result in cumulatively considerable impacts in 2035 for **C-EN-1**, a cumulatively considerable contribution to adverse effects related to energy. Cumulative impacts would be decreased compared to the proposed Plan.	**Not Cumulatively Considerable (decreased)** - Alternative 2 would not result in cumulatively considerable impacts in 2035 for **C-EN-1**, a cumulatively considerable contribution to adverse effects related to energy. Cumulative impacts would be decreased compared to the proposed Plan.	**Not Cumulatively Considerable (decreased)** - Alternative 3 would not result in cumulatively considerable impacts in 2035 for **C-EN-1**, a cumulatively considerable contribution to adverse effects related to energy. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Less-than-Significant Impact (decreased) –** Alternative 1 would result in a less-than-significant impact in 2050 for **EN-1**. Existing State and regional regulations and programs to reduce energy use would continue to apply to Alternative 1; however, Alternative 1 would concentrate new growth in areas with available multimodal transportation more than the proposed Plan. Thus, Alternative 1 would result in a decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in a less-than-significant impact in 2050 for **EN-1**. Existing State and regional regulations and programs to reduce energy use would continue to apply to Alternative 2; however, Alternative 2 would concentrate new growth in areas with available multimodal transportation as compared to the proposed Plan. Alternative 2 would result in more efficient energy usage from incentives to use transit as compared to the proposed Plan, thus decreasing reliance on gasoline and diesel fuel to power automobiles. Thus, Alternative 2 would result in a decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in a less-than- significant impact in 2050 for **EN-1**. Existing State and regional regulations and programs to reduce energy use would continue to apply to Alternative 3; however, Alternative 3 would concentrate new growth in areas with available multimodal transportation as compared to the proposed Plan, resulting in more efficient energy usage for transportation during project operations. Moreover, the free transit component of Alternative 3 could incentivize increased reliance on transit leading to decreased energy per capita for on-road transportation as compared to the proposed Plan. This could occur as gasoline and diesel fuel consumption associated with on-road vehicles shifts to transit, which may be powered by electricity or condensed natural gas. Thus, Alternative 3 would result in a decreased, less-than-significant impact.
2050	**Less-than-Significant Impact (same) –** Alternative 1 would result in a less-than-significant impact in 2050 for **EN-2**. Alternative 1 would be consistent with adopted plans to address energy and thus would result in the same significant impact as the proposed Plan.	**Less-than-Significant Impact (same) –** Alternative 2 would result in a less-than-significant impact in 2050 for **EN-2**. Alternative 2 would be consistent with adopted plans to address energy and thus would result in the same significant impact as the proposed Plan.	**Less-than-Significant Impact (same) –** Alternative 3 would result in a less-than-significant impact in 2050 for **EN-2**. Alternative 3 would be consistent with adopted plans to address energy and thus would result in the same significant impact as the proposed Plan.
2050	**Not Cumulatively Considerable (decreased)** - Alternative 1 would not result in cumulatively considerable impacts in 2050 for **C-EN-1**, a cumulatively considerable contribution to adverse effects related to energy. Cumulative impacts would be decreased compared to the proposed Plan.	**Not Cumulatively Considerable (decreased)** - Alternative 1 would not result in cumulatively considerable impacts in 2050 for **C-EN-1**, a cumulatively considerable contribution to adverse effects related to energy. Cumulative impacts would be decreased compared to the proposed Plan.	**Not Cumulatively Considerable (decreased)** - Alternative 3 would not result in cumulatively considerable impacts in 2050 for **C-EN-1**, a cumulatively considerable contribution to adverse effects related to energy. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Geology, Soils, and Paleontological Resources		
2035	**Less-than-Significant Impact (same) –** Alternative 1 would result in similar less-than-significant impacts in 2035 for **GEO-1**, expose people or structures to potential substantial significant impacts, including the risk of loss, injury, or death involving: a) rupture of a known earthquake fault, b) strong seismic ground shaking; c) seismic-related ground failure, including liquefaction; and d) seismically-induced landslides; **GEO-2**, locate projects on a geologic unit or soil that is expansive or unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse; **GEO-3**, result in substantial soil erosion or the loss of topsoil; and **GEO-4**, have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems, potentially causing adverse groundwater impacts. Alternative 1 would result in less-than-significant impacts due to adherence to applicable laws and regulations and thus would result in the same less-than-significant impact as the proposed Plan.	**Less-than-Significant Impact (same) –** The proposed Plan would result in less-than-significant impacts in 2035 (**GEO-1**, **GEO-2**, **GEO-3,** and **GEO-4**). Alternative 2 would result in less-than-significant impacts due to adherence to applicable laws and regulations and thus would result in the same less-than-significant impact as the proposed Plan.	**Less-than-Significant Impact (same)–** The proposed Plan would result in less-than-significant impacts in 2035 (**GEO-1**, **GEO-2**, **GEO-3,** and **GEO-4**). Alternative 3 would result in less-than-significant impacts due to adherence to applicable laws and regulations and thus would result in the same less-than-significant impact as the proposed Plan.
2035	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact in 2035 for **GEO-5**, directly or indirectly destroy a unique paleontological resource or site or unique geological feature. Impacts would be decreased compared to the proposed Plan in 2035 because Alternative 1 land use pattern would be more concentrated in urban areas than the proposed Plan, which would result in less land use conflict with, and likelihood of disturbing, unique paleontological and geologic resources. Alternative 1 would thus result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2035 for **GEO-5**. Impacts would be decreased compared to the proposed Plan in 2035 because Alternative 2 land use pattern would be more concentrated in urban areas than the proposed Plan, which would result in less land use conflict with, and likelihood of disturbing, unique paleontological and geologic resources. Alternative 2 would thus result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 3 would result in significant impact in 2035 for **GEO-5**. Impacts would be decreased compared to the proposed Plan in 2035 because Alternative 3 land use pattern would be more concentrated in urban areas than the proposed Plan, which would result in less land use conflict with, and likelihood of disturbing, unique paleontological and geologic resources. Alternative 3 would thus result in a similar, but decreased, significant impact compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-PALEO-1**, a cumulatively considerable contribution to adverse effects on paleontological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** – Similar to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact in 2035 for **C-GEO-1,** geologic or seismic hazards or unstable soils.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-PALEO-1**, a cumulatively considerable contribution to adverse effects on paleontological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** – Similar to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact in 2035 for **C-GEO-1**, geologic or seismic hazards or unstable soils.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-PALEO-1**, a cumulatively considerable contribution to adverse effects on paleontological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** – Similar to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact in 2035 for **C-GEO-1,** geologic or seismic hazards or unstable soils.
2050	**Less-than-Significant Impact (same) –** The proposed Plan would result in less-than-significant impacts in 2050 for **GEO-1**, **GEO-2**, **GEO-3,** and **GEO-4**. Alternative 1 would result in the same less-than-significant impact as the proposed Plan due to adherence to applicable laws and regulations.	**Less-than-Significant Impact (same) –** The proposed Plan would result in less-than-significant impacts in 2050 for **GEO-1**, **GEO-2**, **GEO-3,** and **GEO-4**. Alternative 2 would result in the same less-than-significant impact as the proposed Plan due to adherence to applicable laws and regulations.	**Less-than-Significant Impact (same) –** The proposed Plan would result in less-than-significant impacts in 2050 for **GEO-1**, **GEO-2**, **GEO-3,** and **GEO-4**. Alternative 3 would result in the same less-than-significant impacts as the proposed Plan due to adherence to applicable laws and regulations.
2050	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact in 2050 for **GEO-5**. Impacts from regional growth and land use change would be reduced compared to the proposed Plan in 2050 due to a more concentrated land use pattern. Therefore, this alternative would result in less impacts to unique paleontological and geologic resources. Alternative 1 would thus result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2050 for **GEO-5**. Impacts from regional growth and land use change would be reduced compared to the proposed Plan in 2050 due to a more concentrated land use pattern. Therefore, this alternative would result in less impacts to unique paleontological and geologic resources. Alternative 2 would thus result in a similar, but decreased, significant impact compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2050 for **GEO-5**. Impacts from regional growth and land use change would decrease compared to the proposed Plan in 2050 due to a more concentrated land use pattern. Thus, Alternative 3 would result in less impacts to unique paleontological and geologic resources. Alternative 3 would thus result in a similar, but decreased, significant impact compared to the proposed Plan.
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-PALEO-1**, a cumulatively considerable contribution to adverse effects on paleontological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** – Similar to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact in 2050 for **C-GEO-1,** geologic or seismic hazards or unstable soils.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-PALEO-1**, a cumulatively considerable contribution to adverse effects on paleontological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** – Similar to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact in 2050 for **C-GEO-1,** geologic or seismic hazards or unstable soils.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-PALEO-1**, a cumulatively considerable contribution to adverse effects on paleontological resources. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** – Similar to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact in 2050 for **C-GEO-1,** geologic or seismic hazards or unstable soils.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Greenhouse Gas Emissions		
2035	**Less-than-Significant Impact (increased) –** Alternative 1 would result in less-than-significant impacts in 2035 for **GHG-1,** directly or indirectly result in an increase in GHG emissions compared to existing conditions (2022); and **GHG-3,** conflict with or impede the implementation of local plans adopted for the purpose of reducing GHG emissions. As shown in Appendix M, Tables M-3 and M-4, regional growth, land uses, and transportation network improvements for Alternative 1 would result in higher GHG emissions than the proposed Plan, due higher VMT, but lower emissions than 2022 baseline levels Population projections are anticipated to be the same as the proposed Plan under this Alternative, so future year emission estimates for other sectors (e.g., electricity, natural gas) would be similar under this Alternative (**GHG-1**). Alternative 1 would not conflict with or impede the implementation of local plans because it would not impair a local jurisdiction's independent capacity to implement measures of a climate action plan (CAP) or greenhouse gas reduction plan (GHGRP) (**GHG-3**). Thus, Alternative 1 would result in similar, but increased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in less-than-significant impacts in 2035 (**GHG-1** and **GHG-3**). As shown in Appendix M, Tables M-3 and M-4, regional growth, land uses, and transportation network improvements for Alternative 2 would result in lower GHG emissions than the proposed Plan due to more compact development around available multimodal transportation, increased parking pricing, and freeway speed reductions. Similar to the proposed Plan, Alternative 2's 2035 GHG emissions would be lower than 2022 baseline levels. Population projections are anticipated to be the same as the proposed Plan under this Alternative, so future year emission estimates for other sectors (e.g., electricity, natural gas) would be similar under this Alternative (**GHG-1**). Alternative 2 would not conflict with or impede the implementation of local plans because it would not impair a local jurisdiction's independent capacity to implement measures of a CAP or GHGRP (**GHG-3**). Thus, Alternative 2 would result in similar, but decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in less-than-significant impacts in 2035 (**GHG-1** and **GHG-3**). As shown in Appendix M, Tables M-3 and M-4, regional growth, land uses, and transportation network improvements for Alternative 3 would result in lower GHG emissions than the proposed Plan due to more compact development around available multimodal transportation, increased parking pricing, and free transit, and would result in decreased impacts. Similar to the proposed Plan, Alternative 3's 2035 GHG emissions would be lower than 2022 baseline levels. Population projections are anticipated to be the same as the proposed Plan under this Alternative, so future year emission estimates for other sectors (e.g., electricity, natural gas) would be similar under this Alternative (**GHG-1).** Alternative 3 would not conflict with or impede the implementation of local plans because it would not impair a local jurisdiction's independent capacity to implement measures of a CAP or GHGRP (**GHG-3**). Thus, Alternative 3 would result in similar, but decreased, less-than-significant impacts.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Significant Impact (increased) -** Alternative 1 would result in a significant impact in 2035 for **GHG-2**, conflict with achievement of SB 375 GHG emissions reduction targets for 2035. Notably, Alternative 1 would increase the significance determination compared to the proposed Plan, which has a less-than-significant impact. As shown in Appendix M, Table M-3, Alternative 1 would result in a 16.3% per capita GHG reduction below 2005 levels, which would not meet the 2035 reduced goal of 19% below 2005. Alternative 1 would result in less reductions than the proposed Plan because under Alternative 1, transportation projects would be funded for a shorter duration, thus not achieving the VMT and associated GHG reductions as compared to the proposed Plan. Thus, Alternative 1 would have a significant impact.	**Less-than-Significant Impact (decreased)-** Alternative 2 would result in a less-than-significant impact in 2035 for **GHG-2** and would result in a decreased impact compared to the proposed Plan. As shown in Appendix M, Table M-3, Alternative 2 would result in a 23.6% per capita GHG reduction, which would exceed the 2035 reduction goal of 19% below 2005. Alternative 2 would result in greater GHG reductions than the proposed Plan because of the VMT and associated GHG reductions achieved as compared to the proposed Plan. Thus, Alternative 2 would have a similar, but decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased)-** Alternative 3 would result in a less-than-significant impact in 2035 for **GHG-2** and would result in a decreased impact compared to the proposed Plan. As shown in Appendix M, Table M-3, Alternative 3 would result in a 22% per capita GHG reduction, which would exceed the 2035 reduction goal of 19% below 2005, and would result in a greater reduction than the proposed Plan. Alternative 3 would result in greater GHG reductions than the proposed Plan because of the VMT and associated GHG reductions achieved as compared to the proposed Plan. Thus, Alternative 3 would have a similar, but decreased, less-than-significant impact.
2035	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2035 for **GHG-4**, be inconsistent with the State's ability to achieve the 2030 reduction target of SB 32 and 2045 reduction goal of AB 1279. As shown in Appendix M, Tables M-3 and M-4, Alternative 1 would result in higher GHG emissions associated with increases in VMT and GHG emissions as compared to the proposed Plan due to decreased funding for transportation projects. For this reason, Alternative 1 would not meet the reduction target reference points for 2030 and 2045, which would be based on the total mobile source emissions for Alternative 1 plus other sector emissions (e.g., stationary, area, energy, water, wastewater, solid waste) which would be same as the proposed Plan. Therefore, Alternative 1 would result in increased impacts compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2035 for **GHG-4**. As shown in Appendix M, Tables M-3 and M-4, Alternative 3 would result in lower GHG emissions associated with decreases in VMT and GHG emissions as compared to the proposed Plan due to focused growth, higher parking pricing, and speed reductions as compared to the proposed Plan. Nevertheless, Alternative 2 would not meet the reduction target reference points for 2030 and 2045, which would be based on the total mobile source emissions for Alternative 2 plus other sector emissions (e.g., stationary, area, energy, water, wastewater, solid waste) which would be same as the proposed Plan. Therefore, Alternative 2 would result in decreased impacts compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2035 for **GHG-4**. As shown in Appendix M, Tables M-3 and M-4, Alternative 3 would result in lower GHG emissions compared to the proposed Plan associated with decreases in VMT and GHG emissions due to focused growth, higher parking and managed lane pricing, and free transit as compared to the proposed Plan. Nevertheless, Alternative 3 would not meet the reduction target reference points for 2030 and 2045, which would be based on the total mobile source emissions for Alternative 3 plus other sector emissions (e.g., stationary, area, energy, water, wastewater, solid waste) which would be same as the proposed Plan. Therefore, Alternative 3 would result in decreased impacts compared to the proposed Plan.
2035	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-GHG-1**, a cumulatively considerable contribution to adverse effects related to GHG emissions. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-GHG-1**, a cumulatively considerable contribution to adverse effects related to GHG emissions. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-GHG-1**, a cumulatively considerable contribution to adverse effects related to GHG emissions. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Less-than-Significant Impact (increased) –** Alternative 1 would result in less-than-significant impacts in 2050 for **GHG-1** and **GHG-3**. As shown in Appendix M, Tables M-3 and O-4, regional growth, land uses, and transportation network improvements for Alternative 1 would result in higher GHG emissions in 2050 than the proposed Plan, due to fewer transit-oriented transportation network improvement projects, but lower emissions than 2022 baseline levels (**GHG-1**). Alternative 1's GHG emissions would not conflict with or impede the implementation of local plans because it would not impair a local jurisdiction's independent capacity to implement measures of a CAP or GHGRP (**GHG-3**). Alternative 1 would result in similar, but increased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in less-than-significant impacts in 2050 for **GHG-1** and **GHG-3**. As shown in Appendix M, Tables M-3 and M-4, regional growth, land uses, and transportation network improvements for Alternative 2 would result in lower GHG emissions than the proposed Plan due to more compact development, increased parking pricing, and freeway speed reductions. and would result in decreased impacts. Similar to the proposed Plan, Alternative 2's 2050 GHG emissions would be lower than 2022 baseline levels (**GHG-1**). Alternative 2's GHG emissions would not conflict with or impede the implementation of local plans because it would not impair a local jurisdiction's independent capacity to implement measures of a CAP or GHGRP (**GHG-3**). Thus, Alternative 2 would result in similar, but decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in less-than-significant impacts in 2050 for **GHG-1** and **GHG-3**. As shown in Appendix M, Tables M-3 and M-4, regional growth, land uses, and transportation network improvements for Alternative 3 would result in lower GHG emissions than the proposed Plan due to more compact development, increased parking pricing, and free transit, and would result in decreased impacts. Similar to the proposed Plan, Alternative 3's 2050 GHG emissions would be lower than 2022 baseline levels (**GHG-1**). Alternative 3's GHG emissions would not conflict with or impede the implementation of local plans because it would not impair a local jurisdiction's independent capacity to implement measures of a CAP or GHGRP (**GHG-3**). Thus, Alternative 3 would result in similar, but decreased, less-than-significant impacts.
2050	**No Impact (same)** - **GHG-2**, conflict with achievement of SB 375 GHG emissions reduction targets for 2035, does not consider impacts in 2050.	**No Impact (same)** - **GHG-2**, conflict with achievement of SB 375 GHG emissions reduction targets for 2035, does not consider impacts in 2050.	**No Impact (same)** - **GHG-2**, conflict with achievement of SB 375 GHG emissions reduction targets for 2035, does not consider impacts in 2050.
2045 and 2050	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2050 for **GHG-4**. As shown in Appendix M, Tables M-3 and M-4, Alternative 1 would result in higher GHG emissions associated with increases in VMT and GHG emissions as compared to the proposed Plan due to decreased funding for transportation projects. For this reason, Alternative 1 would not meet the reduction target reference points for 2045 and 2050, which would be based on the total mobile source emissions for Alternative 1 plus other sector emissions (e.g., stationary, area, energy, water, wastewater, solid waste) which would be same as the proposed Plan. Therefore, Alternative 1 would result in increased impacts compared to the proposed Plan.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2050 for **GHG-4**. Alternative 2 would result in lower GHG emissions associated with decreases in VMT and GHG emissions as compared to the proposed Plan due to focused growth, higher parking pricing, and speed reductions as compared to the proposed Plan. Nevertheless, Alternative 2 still would not meet the reduction target reference points for 2045 and 2050, which would be based on the total mobile source emissions for Alternative 2 plus other sector emissions (e.g., stationary, area, energy, water, wastewater, solid waste) which would be same as the proposed Plan. Alternative 2 would result in decreased impacts compared to the proposed Plan. Refer to Appendix M, Table M-3 and M-4.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2050 for **GHG-4**. Alternative 3 would result in lower GHG emissions associated with decreases in VMT and GHG emissions due to focused growth, higher parking and managed lane pricing, and free transit as compared to the proposed Plan. Nevertheless, Alternative 3 still would not meet the reduction target reference points for 2045 and 2050 which would be based on the total mobile source emissions for Alternative 3 plus other sector emissions (e.g., stationary, area, energy, water, wastewater, solid waste) which would be same as the proposed Plan. Alternative 3 would result in decreased impacts compared to the proposed Plan. Refer to Appendix M, Table M-3 and M-4.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Cumulatively Considerable (increased)** - Alternative 1 would result in less than cumulatively considerable impacts in 2050 for **C-GHG-1**, a cumulatively considerable contribution to adverse effects related to GHG emissions. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-GHG-1**, a cumulatively considerable contribution to adverse effects related to GHG emissions. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3would result in cumulatively considerable impacts in 2050 for **C-GHG-1**, a cumulatively considerable contribution to adverse effects related to GHG emissions. Cumulative impacts would be decreased compared to the proposed Plan.
	Hazards and Hazardous Materials		
2035	**Significant Impact (same) –** Alternative 1 would result in a significant impact in 2035 for **HAZ-4,** impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan or result in inadequate emergency access. This impact would be the same as the proposed Plan because regional growth would be more compact in Alternative 1, which would lead to shorter emergency response times but more people using the same evacuation routes. Alternative 1 would thus result in similar significant impacts.	**Significant Impact (same) –** Alternative 2 would result in a significant impact in 2035 for **HAZ-4**. This impact would be the same as the proposed Plan because regional growth would be more compact in Alternative 2, which would lead to shorter emergency response times but more people using the same evacuation routes. Alternative 2 would thus result in similar significant impacts.	**Significant Impact (same) –** Alternative 3 would result in a significant impact in 2035 for **HAZ-4**. This impact would be the same as the proposed Plan because regional growth would be more compact in Alternative 3, which would lead to shorter emergency response times but more people using the same evacuation routes. Alternative 3 would thus result in similar significant impacts.
2035	**Less-than-Significant Impact (same)** – Alternative 1 would result in less-than-significant impacts in 2035 for **HAZ-1,** create a significant hazard by generating hazardous emissions or handle hazardous materials or result in the release of hazardous materials in the environment during pre-construction, demolition, and/or construction activities, including being located on a Government Code Section 65952.5 hazardous materials site; **HAZ-2**, create a significant hazard to the public, schools or the environment through the routine use, handling, transport, or disposal of hazardous materials; and **HAZ-3**, for a project located within an airport land use plan or where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard for people residing or working in the project area. These impacts would be the same as proposed Plan impacts because existing regulations, plans, and programs maintaining these impacts at less-than-significant levels would continue to apply to Alternative 1.	**Less-than-Significant Impact (same)** – Alternative 2 would result in less-than-significant impacts in 2035 for **HAZ-1**, **HAZ-2**, and **HAZ-3**. These impacts would be the same as proposed Plan impacts because existing regulations, plans, and programs maintaining these impacts at less-than-significant levels would apply to Alternative 2.	**Less-than-Significant Impact (same)** – Alternative 3 would result in less-than-significant impacts in 2035 for **HAZ-1**, **HAZ-2**, and **HAZ-3**. These impacts would be the same as proposed Plan impacts because existing regulations, plans, and programs maintaining these impacts at less-than-significant levels would apply to Alternative 3.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Cumulatively Considerable (same)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-HAZ-1**, a cumulatively considerable contribution to adverse effects related to emergency response and evacuation plan or result in inadequate emergency access, the same as the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-HAZ-1** in 2035 for the other hazards significant thresholds (HAZ-1, HAZ-2, and HAZ-3).	**Cumulatively Considerable (same)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-HAZ-1**, a cumulatively considerable contribution to adverse effects related to emergency response and evacuation plan or result in inadequate emergency access, the same as the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-HAZ-1** in 2035 for the other hazards significant thresholds (HAZ-1, HAZ-2, and HAZ-3).	**Cumulatively Considerable (same)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-HAZ-1**, a cumulatively considerable contribution to adverse effects related to emergency response and evacuation plan or result in inadequate emergency access, the same as the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-HAZ-1** in 2035 for the other hazards significant thresholds (HAZ-1, HAZ-2, and HAZ-3).
2050	**Significant Impact (same) –** Alternative 1 would result in a significant impact in 2050 for **HAZ-4** and the impact would be the same as the proposed Plan. The rationale described for 2035 applies to 2050.	**Significant Impact (same) –** Alternative 2 would result in a significant impact in 2050 for **HAZ-4** and the impact would be the same as the proposed Plan. The rationale described for 2035 applies to 2050.	**Significant Impact (same) –** Alternative 3 would result in a significant impact in 2050 for **HAZ-4** and the impact would be the same as the proposed Plan. The rationale described for 2035 applies to 2050.
2050	**Less-than-Significant Impact (same)** – Alternative 1 would result in less-than-significant impacts in 2050 for **HAZ-1**, **HAZ-2**, and **HAZ-3** and the impacts would be the same as the proposed Plan. The rationale described for 2035 applies to 2050.	**Less-than-Significant Impact (same)** – Alternative 2 would result in less-than- significant impacts in 2050 for **HAZ-1**, **HAZ-2**, and **HAZ-3** and the impacts would be the same as the proposed Plan. The rationale described for 2035 applies to 2050.	**Less-than-Significant Impact (same)** – Alternative 3 would result in less-than- significant impacts in 2050 for **HAZ-1**, **HAZ-2**, and **HAZ-3** and the impacts would be the same as the proposed Plan. The rationale described for 2035 applies to 2050.
2050	**Cumulatively Considerable (same)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-HAZ-1**, a cumulatively considerable contribution to adverse effects related to emergency response and evacuation plan or result in inadequate emergency access, the same as the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-HAZ-1** in 2050 for the other hazards significant thresholds (HAZ-1, HAZ-2, and HAZ-3).	**Cumulatively Considerable (same)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-HAZ-1**, a cumulatively considerable contribution to adverse effects related to emergency response and evacuation plan or result in inadequate emergency access, the same as the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-HAZ-1** in 2050 for the other hazards significant thresholds (HAZ-1, HAZ-2, and HAZ-3).	**Cumulatively Considerable (same)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-HAZ-1**, a cumulatively considerable contribution to adverse effects related to emergency response and evacuation plan or result in inadequate emergency access, the same as the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-HAZ-1** in 2050 for the other hazards significant thresholds (HAZ-1, HAZ-2, and HAZ-3).

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Hydrology and Water Quality		
2035	**Less-than-Significant Impact (decreased) –** Alternative 1 would result in less-than-significant impacts in 2035 for **HWQ-1**, substantially degrade surface water or groundwater quality, including in violation of any water quality standards or waste discharge requirements or in conflict with a water quality control plan or its implementation; **HWQ-2**, substantially alter the existing drainage patter of any area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site; **HWQ-3**, substantially alter the existing drainage pattern of an area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would (i) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site or (ii) impede or redirect flood flows; and **HWQ-4**, substantially increase risk of pollutant release due to inundation of a flood hazard, tsunami, or seiche zone. Existing regulations, plans, and programs would continue to be in effect, and design measures would be implemented, the same as under the proposed Plan. However, the land use pattern would be more concentrated in Alternative 1 compared to the proposed project, which would result in less impervious surfaces and less stormwater run-off region wide, decreasing the risk and rate of flood flows and associated pollutant releases (**HWQ-1**, **HWQ-2**, **HWQ-3**, and **HWQ-4**). Alternative 1 would thus have similar, but decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in less-than-significant impacts in 2035 for **HWQ-1**, **HWQ-2**, **HWQ-3**, and **HWQ-4**. Existing regulations, plans, and programs would be in effect, and implementation of design measures would occur, the same as under the proposed Plan; however, the land use pattern would be more concentrated in Alternative 2 compared to the proposed project, which would result in less impervious surfaces and less stormwater run-off region wide, decreasing the risk and rate of flood flows and associated pollutant releases (**HWQ-1**, **HWQ-2**, **HWQ-3**, and **HWQ-4**). Alternative 2 would thus have similar, but decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in less-than-significant impacts in 2035 for **HWQ-1**, **HWQ-2**, **HWQ-3**, and **HWQ-4**. Existing regulations, plans, and programs would be in effect, and implementation of design measures would occur, the same as under the proposed Plan; however, the land use pattern would be more concentrated in Alternative 3 compared to the proposed project, which would result in less impervious surfaces and less stormwater run-off region wide, decreasing the risk and rate of flood flows and associated pollutant releases (**HWQ-1**, **HWQ-2**, **HWQ-3**, and **HWQ-4**). Alternative 3 would thus have similar, but decreased, less-than-significant impacts.
2035	**Not Cumulatively Considerable (decreased)** – Similar to the proposed Plan, Alternative 1 would not result in cumulatively considerable impacts for **C-HWQ-1** related to hydrology and water quality in 2035.	**Not Cumulatively Considerable (decreased)** – Similar to the proposed Plan, Alternative 2 would not result in cumulatively considerable impacts for **C-HWQ-1** related to hydrology and water quality in 2035.	**Not Cumulatively Considerable (decreased)** – Similar to the proposed Plan, Alternative 3 would not result in cumulatively considerable impacts for **C-HWQ-1** related to hydrology and water quality in 2035.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Less-than-Significant Impact (decreased) –** Alternative 1 would result in less-than-significant impacts in 2050 for **HWQ-1**, **HWQ-2**, **HWQ-3**, and **HWQ-4**. Existing regulations, plans, and programs would be in effect, and implementation of design measures would occur, the same as under the proposed Plan; however, regional growth would be more concentrated in areas with available multimodal transportation in Alternative 1 compared to the proposed project, which would result in less impervious surfaces and less stormwater run-off region wide. The rationale described for 2035 applies to 2050. Alternative 1 would thus have similar, but decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in less-than-significant impacts in 2050 for **HWQ-1**, **HWQ-2**, **HWQ-3**, and **HWQ-4**. Existing regulations, plans, and programs would be in effect, and implementation of design measures would occur, the same as under the proposed Plan; however, regional growth would be more concentrated in areas with available multimodal transportation in Alternative 2 compared to the proposed project, which would result in less impervious surfaces and less stormwater run-off region wide. The rationale described for 2035 applies to 2050. Alternative 2 would thus have similar, but decreased, less-than-significant impacts.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in less-than-significant impacts in 2050 for **HWQ-1**, **HWQ- 2**, **HWQ-3**, and **HWQ-4**. Existing regulations, plans, and programs would be in effect, and implementation of design measures would occur, the same as under the proposed Plan; however, regional growth would be more concentrated in areas with available multimodal transportation in Alternative 3 compared to the proposed project, which would result in less impervious surfaces and less stormwater run-off region wide. The rationale described for 2035 applies to 2050. Alternative 3 would thus have similar, but decreased, less-than-significant impacts.
2050	**Not Cumulatively Considerable (decreased)** – Similar to the proposed Plan, Alternative 1 would not result in cumulatively considerable impacts for **C-HWQ-1** related to hydrology and water quality in 2050.	**Not Cumulatively Considerable (decreased)** – Similar to the proposed Plan, Alternative 2 would not result in cumulatively considerable impacts for **C-HWQ-1** related to hydrology and water quality in 2050.	**Not Cumulatively Considerable (decreased)** – Similar to the proposed Plan, Alternative 3 would not result in cumulatively considerable impacts for **C-HWQ-1**related to hydrology and water quality in 2050.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Land Use		
2035	**Less-than-Significant Impact (increased)** – Alternative 1 would result in a less-than-significant impact in 2035 for **LU-1**, physically divide an established community. This impact would be increased for Alternative 1 because land use would be more concentrated in urban areas than under the proposed Plan and would therefore result in greater potential to divide existing communities. Focusing development projects in existing urbanized areas reduces the potential to physically divide an established community as result of dispersed development patterns. Alternative 1 would thus have a similar, but increased, less-than-significant impact. In addition, Alternative 1 would result in a less-than-significant impact in 2035 for **LU-2,** cause a significant environmental impact by conflicting with a land use plan, policy, or regulation (including the General Plan, Local Coastal Program, or Zoning Ordinance) and resulting in a physical change to the environment not already addressed in the EIR. The impact for Alternative 1 would be increased compared to the proposed Plan because this alternative proposes more dense development in urban areas, which occasionally may conflict with the land use portions of adopted general plans and specific plans. Alternative 1 would thus have a similar, but increased, less-than-significant impact.	**Less-than-Significant Impact (increased) –** Alternative 2 would result in a significant impact in 2035 for **LU-1**. This impact would be increased for Alternative 2 because land use would be more concentrated in urban areas than under the proposed Plan and would therefore result in greater potential to divide existing communities. Focusing development projects in existing urbanized areas reduces the potential to physically divide an established community as result of dispersed development patterns. Alternative 2 would thus have a similar, but increased, less-than-significant impact. In addition, Alternative 2 would result in a less-than-significant impact in 2035 for **LU-2**. The impact for Alternative 2 would be increased compared to the proposed Plan because this alternative proposes more dense development in urban areas, which occasionally may conflict with the land use portions of adopted general plans and specific plans. Alternative 2 would thus have a similar, but increased, less-than-significant impact.	**Less-than-Significant Impact (increased) –** Alternative 3 would result in a less-than-significant impact in 2035 for **LU-1**. This impact would be increased for Alternative 3 because land use would be more concentrated in urban areas than under the proposed Plan and would therefore result in greater potential to divide existing communities. Focusing development projects in existing urbanized areas reduces the potential to physically divide an established community as result of dispersed development patterns. Alternative 3 would thus have a similar, but increased, less-than-significant impact. In addition, Alternative 3 would result in a less-than-significant impact in 2035 for **LU-2**. The impact for Alternative 3 would be increased compared to the proposed Plan because this alternative proposes more dense development in urban areas, which occasionally may conflict with the land use portions of adopted general plans and specific plans. Alternative 3 would thus have a similar, but increased, less-than-significant impact.
2035	**Not Cumulatively Considerable (increased)** –Alternative 1 would not result in cumulatively considerable impacts in 2035 for **C-LU-1**, a cumulatively considerable contribution to adverse impacts to land use and planning. Cumulative impacts would be increased compared to the proposed Plan.	**Not Cumulatively Considerable (increased)** –Alternative 2 would not result in cumulatively considerable impacts in 2035 for **C-LU-1**, a cumulatively considerable contribution to adverse impacts to land use and planning. Cumulative impacts would be increased compared to the proposed Plan.	**Not Cumulatively Considerable (increased)** – Alternative 3 would not result in cumulatively considerable impacts in 2035 for **C-LU-1**, a cumulatively considerable contribution to adverse impacts to land use and planning. Cumulative impacts would be increased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2050 for **LU-1** and the impact would be increased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 1 would thus have a similar, but increased, significant impact.	**Significant Impact (increased)** – Alternative 2 would result a significant impact in 2050 for **LU-1** and the impact would be increased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 2 would thus have a similar, but increased, significant impact.	**Significant Impact (increased)** – Alternative 3 would result in a significant impact in 2050 for **LU-1** and the impact would be increased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 3 would thus have a similar, but increased, significant impact.
2050	**Less-than-Significant Impact (increased)** – Alternative 1 would result in a less-than-significant impact in 2050 for **LU-2** and the impact would be increased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 1 would thus have a similar, but increased, less-than-significant impact.	**Less-than-Significant Impact (increased)** – Alternative 2 would result in a less-than-significant impact in 2050 for **LU-2** and the impact would be increased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 2 would thus have a similar, but increased, less-than-significant impact.	**Less-than-Significant Impact (increased) –** Alternative 3 would result in a less-than-significant impact in 2050 for **LU-2** and the impact would be increased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 3 would thus have a similar, but increased, less-than-significant impact.
2050	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-LU-1**, a cumulatively considerable contribution to adverse impacts related to land use and planning. Cumulative impacts would be increased compared to the proposed Plan. **Not Cumulatively Considerable (increased)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-LU-**1 in 2050 for threshold LU-2.	**Cumulatively Considerable (increased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-LU-1**, a cumulatively considerable contribution to adverse impacts related to land use and planning. Cumulative impacts would be increased compared to the proposed Plan. **Not Cumulatively Considerable (increased)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-LU-1** in 2050 for threshold LU-2.	**Cumulatively Considerable (increased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-LU-1**, a cumulatively considerable contribution to adverse impacts related to land use and planning. Cumulative impacts would be increased compared to the proposed Plan. **Not Cumulatively Considerable (increased)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-LU-1** in 2050 for threshold LU-2.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Mineral Resources		
2035	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact on mineral resources in 2035 for **MR-1,** result in the loss of availability of known aggregate and mineral resources supply sites that would be of value to the region and the residents of the State, or result in the loss of availability of a locally-important mineral resource recovery site delineated in a local general plan, specific plan or other land use plan. The impact would be decreased compared to the proposed Plan because Alternative 1 land use would be more concentrated in urban areas than under the proposed Plan and would therefore result in less potential for land use conflicts with mineral resources in previously undeveloped areas. Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on mineral resources in 2035 for **MR-1**. The impact would be decreased compared to the proposed Plan because Alternative 2 land use would be more concentrated in urban areas than under the proposed Plan and would therefore result in less potential for land use conflicts with mineral resources in previously undeveloped areas. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on mineral resources in 2035 for **MR-1**. The impact would be decreased compared to the proposed Plan because Alternative 3 land use would be more concentrated in urban areas than under the proposed Plan and would therefore result in less potential for land use conflicts with mineral resources in previously undeveloped areas. Alternative 3 would thus have a similar, but decreased, significant impact.
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-MR-1**, a cumulatively considerable contribution to adverse impacts related to mineral resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-MR-1**, a cumulatively considerable contribution to adverse impacts related to mineral resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-MR-1**, a cumulatively considerable contribution to adverse impacts related to mineral resources. Cumulative impacts would be decreased compared to the proposed Plan.
2050	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact on mineral resources in 2050 for **MR-1** and the impact would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on mineral resources in 2050 for **MR-1** and the impact would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on mineral resources in 2050 for **MR-1** and the impact would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 3 would thus have a similar, but decreased, significant impact.
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-MR-1**, a cumulatively considerable contribution to adverse impacts related to mineral resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-MR-1**, a cumulatively considerable contribution to adverse impacts related to mineral resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-MR-1**, a cumulatively considerable contribution to adverse impacts related to mineral resources. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Noise and Vibration		
2035	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts in 2035 for **NOI-1**, generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies; or generate a substantial absolute increase in ambient noise; and **NOI-2**, generation of excessive groundborne vibration or groundborne noise levels. The impacts would be decreased compared to the proposed Plan in 2035 because Alternative 1 land use would be more concentrated in areas with available multimodal transportation than under the proposed Plan, which would result in the exposure of fewer sensitive receptors to high noise and vibration levels than the proposed Plan. Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in significant impacts in 2035 for **NOI-1** and **NOI-2**. The impacts would be decreased compared to the proposed Plan in 2035 because Alternative 2 land use would be more concentrated in areas with available multimodal transportation than under the proposed Plan, which would result in the exposure of fewer sensitive receptors to high noise and vibration levels than the proposed Plan. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in significant impacts in 2035 for **NOI-1** and **NOI-2**. The impacts would be decreased compared to the proposed Plan in 2035 because Alternative 3 land use would be more concentrated in areas with available multimodal transportation than under the proposed Plan, which would result in the exposure of fewer sensitive receptors to high noise and vibration levels than the proposed Plan. Alternative 3 would thus have a similar, but decreased, significant impact.
2035	**Less-than-Significant Impact (same)** – Alternative 1 would result in less-than-significant impacts in 2035 for **NOI-3**, for a project located in the vicinity of a private airstrip or an airport land use plan, or, where a plan has not been adopted, within two miles of a public airport, the project would expose people residing or working in the project area to excessive noise levels. The impact of this alternative is the same as under the proposed Plan because this alternative would not meaningfully change exposure of people to excessive noise levels from aircraft. To prevent incompatible uses in areas with higher aircraft noise, ALUCPs and AICUZs establish land use policies and criteria (e.g., noise compatibility zones) to limit future incompatible uses in certain areas to minimize noise impacts to people living and working within the ALUCP or AICUZ. Both Alternative 1 and the proposed Plan would comply with such policies and criteria. Alternative 1 would thus have a similar, less-than-significant impact.	**Less-than-Significant Impact (same)** – Alternative 2 would result in less-than-significant impacts in 2035 for **NOI-3**. The impact of this alternative is the same as under the proposed Plan because this alternative would not meaningfully change exposure of people to excessive noise levels from aircraft. To prevent incompatible uses in areas with higher aircraft noise, ALUCPs and AICUZs establish land use policies and criteria (e.g., noise compatibility zones) to limit future incompatible uses in certain areas to minimize noise impacts to people living and working within the ALUCP or AICUZ. Both Alternative 2 and the proposed Plan would comply with such policies and criteria. Alternative 2 would thus have a similar, less-than-significant impact.	**Less-than-Significant Impact (same)** – Alternative 3 would result in less-than-significant impacts in 2035 for **NOI-3**. The impact of this alternative is the same as under the proposed Plan because this alternative would not meaningfully change exposure of people to excessive noise levels from aircraft. To prevent incompatible uses in areas with higher aircraft noise, ALUCPs and AICUZs establish land use policies and criteria (e.g., noise compatibility zones) to limit future incompatible uses in certain areas to minimize noise impacts to people living and working within the ALUCP or AICUZ. Both Alternative 3 and the proposed Plan would comply with such policies and criteria. Alternative 3 would thus have a similar, less-than-significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-NOI-1**, a cumulatively considerable contribution to adverse impacts related to noise and vibration. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-NOI-1** in 2035 for threshold NOI-3.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-NOI-1**, a cumulatively considerable contribution to adverse impacts related to noise and vibration. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-NOI-1** in 2035 for threshold NOI-3.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-NOI-1**, a cumulatively considerable contribution to adverse impacts related to noise and vibration. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-NOI-1** in 2035 for threshold NOI-3.
2050	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts in 2050 for **NOI-1** and **NOI-2**. The impacts would be decreased compared to the proposed Plan in 2050 because Alternative 1's land use pattern would be more concentrated in areas with available multimodal transportation than under the proposed Plan, which would result in the exposure of fewer sensitive receptors to high noise and vibration levels than the proposed Plan. Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in significant impacts in 2050 for **NOI-1** and **NOI-2**. The impacts would be decreased compared to the proposed Plan in 2050 because Alternative 2 land use would be more concentrated in areas with available multimodal transportation than under the proposed Plan, which would result in the exposure of fewer sensitive receptors to high noise and vibration levels than the proposed Plan. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in significant impacts in 2050 for **NOI-1** and **NOI-2**. The impacts would be decreased compared to the proposed Plan in 2050 because Alternative 3 land use would be more concentrated in areas with available multimodal transportation than under the proposed Plan, which would result in the exposure of fewer sensitive receptors to high noise and vibration levels than the proposed Plan. Alternative 3 would thus have a similar, but decreased, significant impact.
2050	**Less-than-Significant Impact (same)** – Alternative 1 would result in a less-than-significant impact in 2050 for **NOI-3**. Alternative 1 would have the same impact as the proposed Plan because Alternative 1 would not meaningfully change exposure of people to excessive noise levels from aircraft. Alternative 1 would thus have a similar, less-than-significant impact.	**Less-than-Significant Impact (same)** – Alternative 1 would result in a less-than-significant impact in 2050 for **NOI-3**. Alternative 2 would have the same impact as the proposed Plan because Alternative 2 would not meaningfully change exposure of people to excessive noise levels from aircraft. Alternative 2 would thus have a similar, less-than-significant impact.	**Less-than-Significant Impact (same)** – Alternative 3 would result in a less-than-significant impact in 2050 for **NOI-3**. Alternative 3 would have the same impact as the proposed Plan because Alternative 3 would not meaningfully change exposure of people to excessive noise levels from aircraft. Alternative 3 would thus have a similar, less-than-significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-NOI-1**, a cumulatively considerable contribution to adverse impacts related to noise and vibration. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-NOI-1** in 2050 for threshold NOI-3.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-NOI-1**, a cumulatively considerable contribution to adverse impacts related to noise and vibration. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-NOI-1** in 2050 for threshold NOI-3.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-NOI-1**, a cumulatively considerable contribution to adverse impacts related to noise and vibration. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-NOI-1** in 2050 for threshold NOI-3.
	Population and Housing		
2035	**Significant Impact (increased) –** Alternative 1 would result in significant impacts for **POP-1,** induce substantial unplanned population growth in the region, either directly (for example, by proposing new homes or businesses) or indirectly (for example, through extension of roads or other infrastructure), and **POP-2,** displace substantial numbers of people or housing units, necessitating construction of replacement housing elsewhere, in 2035. Alternative 1 would have greater impacts than the proposed Plan because increased densification in areas with available multimodal transportation and improved accessibility and connectivity could facilitate population and economic growth in areas of the region that are currently not developed or underdeveloped. Therefore, Alternative 1 would result in greater potential for unplanned population growth in transit served areas than with the proposed Plan (**POP-1**). In addition, more compact land use patterns and transportation projects in developed areas would result in greater displacement of people and housing units (**POP-2**). Alternative 1 would thus have similar, but increased, significant impacts.	**Significant Impact (increased) –** Alternative 2 would result in significant impacts for **POP-1** and **POP-2** in 2035. Growth under Alternative 2, may exceed what is anticipated in local general plans, leading to unplanned population growth. Impacts for Alternative 2 would be greater than the proposed Plan because increased densification in areas with available multimodal transportation and improved accessibility and connectivity, could facilitate population and economic growth in areas of the region that are currently not developed or underdeveloped. Therefore, Alternative 2 would result in greater potential for unplanned population growth in transit served areas than with the proposed Plan (**POP-1**). In addition, more compact land use patterns and transportation projects in developed areas would result in greater displacement of people and housing units (**POP-2**). Alternative 2 would thus have similar, but increased, significant impacts.	**Significant Impact (increased) –** Alternative 3 would result in significant impacts for **POP-1** and **POP-2** in 2035. Growth under Alternative 3, may exceed what is anticipated in local general plans, leading to unplanned population growth. Impacts for Alternative 3 would be greater than the proposed Plan because increased densification in areas with available multimodal transportation and improved accessibility and connectivity, could facilitate population and economic growth in areas of the region that are currently not developed or underdeveloped. Therefore, Alternative 3 would result in greater potential for unplanned population growth in transit served areas. In addition, more compact land use patterns and transportation projects in developed areas would result in greater displacement of people and housing units. Alternative 3 would thus have similar, but increased, significant impacts.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-POP-1**, a cumulatively considerable contribution to adverse impacts related to population and housing. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (increased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-POP-1**, a cumulatively considerable contribution to adverse impacts related to population and housing. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (increased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-POP-1**, a cumulatively considerable contribution to adverse impacts related to population and housing. Cumulative impacts would be increased compared to the proposed Plan.
2050	**Significant Impact (increased) –** Alternative 1 would result in significant impacts for **POP-1** and **POP-2** in 2050 and the impacts would be greater compared to the proposed Plan impact. The rationale described for 2035 applies to 2050. Alternative 1 would thus have similar, but increased, significant impacts.	**Significant Impact (increased) –** Alternative 2 would result in significant impacts for **POP-1** and **POP-2** in 2050 and the impacts would be greater compared to the proposed Plan impact. The rationale described for 2035 applies to 2050. Alternative 2 would thus have similar, but increased, significant impacts.	**Significant Impact (increased) –** Alternative 3 would result in significant impacts for **POP-1** and **POP-2** in 2050 and the impacts would be greater compared to the proposed Plan impact. The rationale described for 2035 applies to 2050. Alternative 3 would thus have similar, but increased, significant impacts.
2050	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-POP-1**, a cumulatively considerable contribution to adverse impacts related to population and housing. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (increased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-POP-1**, a cumulatively considerable contribution to adverse impacts related to population and housing. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (increased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-POP-1**, a cumulatively considerable contribution to adverse impacts related to population and housing. Cumulative impacts would be increased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Public Services, Recreation, and Utilities		
2035	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts in 2035 for **PS-1,** result in substantial physical deterioration of public facilities or cause substantial adverse physical impacts associated with the provision of or need for new or physically altered (i.e. expanded) public facilities, in order to maintain adequate fire and police protection, emergency services, schools, libraries, and recreation facilities; **REC-1**, increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; **U-1**, result in the expansion or construction of wastewater collection and treatment, stormwater drainage, electric power, natural gas, or telecommunications facilities to adequately meet projected capacity needs, the construction of which could cause significant environmental impacts; **U-2**, generate solid waste in excess of State or local standards or in excess of the capacity of local infrastructure, negatively impact the provision of solid waste services or impair the attainment of solid waste reduction goals, or fail to comply with federal, State, and local management and reduction statutes and regulations related to solid waste. The impacts for Alternative 1 would be decreased for each of these significance thresholds compared to the proposed Project because development would be more compact and would be focused in areas that are already served by existing public services, recreation facilities, and utilities. Alternative 1 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 2 would result in significant impacts in 2035 for **PS-1**, **REC-1**, **U-1**, and **U-2**. The impacts for Alternative 2 would be decreased for each of these significance thresholds compared to the proposed Project because development would be more compact and would be focused in areas that are already served by existing public services, recreation facilities, and utilities. Alternative 2 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 3 would result in significant impacts in 2035 for **PS-1**, **REC-1**, **U-1**, and **U-2**. The impacts for Alternative 3 would be decreased for each of these significance thresholds compared to the proposed Project because development would be more compact and would be focused in areas that are already served by existing public services, recreation facilities, and utilities. Alternative 3 would thus have similar, but decreased, significant impacts.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-PS-1**, a cumulatively considerable contribution to adverse impacts related to public services; **C-U-1,** a cumulatively considerable contribution to adverse impacts related to utilities; and **C-REC-1,** a cumulative considerable contribution to adverse impacts related to recreational resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-PS-1**, a cumulatively considerable contribution to adverse impacts related to public services; **C-U-1,** a cumulatively considerable contribution to adverse impacts related to utilities; and **C-REC-1** a cumulative considerable contribution to adverse impacts related to recreational resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-PS-1**, a cumulatively considerable contribution to adverse impacts related to public services; **C-U-1,** a cumulatively considerable contribution to adverse impacts related to utilities; and **C-REC-1,** a cumulative considerable contribution to adverse impacts related to recreational resources. Cumulative impacts would be decreased compared to the proposed Plan.
2050	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts in 2050 for **PS-1**, **REC-1**, **U-1**, and **U-2** and the impacts would be decreased compared to the proposed Plan impacts. The rationale described for 2035 applies to 2050. Alternative 1 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 2 would result in significant impacts in 2050 for **PS-1**, **REC-1**, **U-1**, and **U-2** and the impacts would be decreased compared to the proposed Plan impacts. The rationale described for 2035 applies to 2050. Alternative 2 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 3 would result in significant impacts in 2050 for **PS-1**, **REC-1**, **U-1**, and **U-2** and the impacts would be decreased compared to the proposed Plan impacts. The rationale described for 2035 applies to 2050. Alternative 3 would thus have similar, but decreased, significant impacts.
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-PS-1**, a cumulatively considerable contribution to adverse impacts related to public services; **C-U-1,** a cumulatively considerable contribution to adverse impacts related to utilities; and, **C-REC-1,** a cumulative considerable contribution to adverse impacts related to recreational resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-PS-1**, a cumulatively considerable contribution to adverse impacts related to public services; **C-U-1,** a cumulatively considerable contribution to adverse impacts related to utilities; and, **C-REC-1,** a cumulative considerable contribution to adverse impacts related to recreational resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-PS-1**, a cumulatively considerable contribution to adverse impacts related to public services, **C-U-1,** a cumulatively considerable contribution to adverse impacts related to utilities; and, **C-REC-1,** a cumulative considerable contribution to adverse impacts related to recreational resources. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Transportation		
2030	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2030 for **TRA-2**, conflict or be inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals. The SANDAG ABM3 Model does not provide a 2030 scenario. Therefore, this data was interpolated between base year 2022 and year 2035 data. Alternative 1 would result in a SB-743 based VMT per capita of 16.63 in 2030, exceeding the proposed Plan's 2030 VMT per capita of 16.21. In addition, Alternative 1 would result in an increase in total VMT of 3,872,723 vehicle miles per day in 2030 compared to Baseline Year 2019 conditions. This increase would be greater than the increase of 2,629,048 miles per day in 2030 under the proposed Plan. Therefore, Alternative 1 would result in greater impacts as it would achieve a smaller VMT reduction as compared to the proposed Plan. This is considered significant since Alternative 1 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 1 would thus have a similar, but increased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2030 for **TRA-2**. The SANDAG ABM3 Model does not provide a 2030 scenario. Therefore, this data was interpolated between base year 2022 and year 2035 data. Alternative 2 would result in a SB-743 based VMT per capita of 15.31 in 2030 compared to VMT per capita of 16.21 VMT under the proposed Plan in 2030. Alternative 2 would result in an increase in total VMT of 944,380 vehicle miles per day in 2030 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 2,629,048 miles per day in 2030 under the proposed Plan. Therefore, Alternative 2 would result in less impacts as it would achieve a higher VMT reduction as compared to the proposed Plan. This is considered significant since Alternative 2 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2030 for **TRA-2**. The SANDAG ABM3 Model does not provide a 2030 scenario. Therefore, this data was interpolated between base year 2022 and year 2035 data. Alternative 3 would result in a SB-743 based VMT per capita in 2035 of 15.36 in 2030 compared to the VMT per capita of 16.21 under the proposed Plan in 2030. Alternative 3 would result in an increase in total VMT of 1,137,334 vehicle miles per day in 2030 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 2,629,048 miles per day in 2030 under the proposed Plan. Therefore, Alternative 3 would result in less impacts as it would achieve a higher VMT reduction as compared to the proposed Plan. This is considered significant since Alternative 3 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 3 would thus have a similar, but decreased, significant impact.
2030	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2030 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2030 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2030 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Less-than-Significant Impact (same)** – Alternative 1 would result in less-than-significant impacts in 2035 for **TRA-1,** conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities; and **TRA-3,** substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses. The impact of Alternative 1 is the same as proposed Plan impact because Alternative 1 would be consistent with adopted plans, programs, and design standards. Alternative 1 would thus have similar, less-than-significant impacts.	**Less-than-Significant Impact (same)** – Alternative 2 would result in less-than-significant impacts in 2035 for **TRA-1** and **TRA-3**. The impact of Alternative 2 is the same as proposed Plan impact because Alternative 2 would be consistent with adopted plans, programs, and design standards. Alternative 2 would thus have similar, less-than-significant impacts.	**Less-than-Significant Impact (same)** – Alternative 3 would result in less-than-significant impacts in 2035 for **TRA-1** and **TRA-3**. The impact of Alternative 3 is the same as proposed Plan impact because Alternative 3 would be consistent with adopted plans, programs, and design standards. Alternative 3 would thus have similar, less-than-significant impacts.
2035	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2035 for **TRA-2**, conflict or be inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals. As shown in Appendix M, Table M-2, Alternative 1 would result in a SB-743 based VMT per capita of 16.58 in 2035, exceeding the proposed Plan's 2035 VMT per capita of 15.95. In addition, Alternative 1 would result in an increase in total VMT of 5,845,0414 vehicle miles per day in 2035 compared to Baseline Year 2019 conditions. This increase would be greater than the increase of 3,824,069 miles per day in 2035 under the proposed Plan. This is considered significant since Alternative 1 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Therefore, Alternative 1 would result in greater impacts as it would achieve a smaller VMT reduction as compared to the proposed Plan. Alternative 1 would thus have a similar, but increased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2035 for **TRA-2**. As shown in Appendix M, Table M-2, Alternative 2 would result in a SB-743 based VMT per capita of 15.31 in 2035 compared to VMT per capita of 15.95 VMT under the proposed Plan in 2035. Alternative 2 would result in an increase in total VMT of 1,086,485 vehicle miles per day in 2035 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 3,824,069 miles per day in 2035 under the proposed Plan. Therefore, Alternative 2 would result in less impacts as it would achieve a higher VMT reduction as compared to the proposed Plan. This is considered significant since Alternative 2 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2035 for **TRA-2**. As shown in Appendix M, Table M-2, Alternative 3 would result in a SB-743 based VMT per capita in 2035 of 15.36 in 2035 compared to the VMT per capita of 15.95 under the proposed Plan in 2035. Alternative 3 would result in an increase in total VMT of 1,400,034 vehicle miles per day in 2035 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 3,824,069 miles per day in 2035 under the proposed Plan. Therefore, Alternative 3 would result in less impacts as it would achieve a higher VMT reduction as compared to the proposed Plan. This is considered significant since Alternative 3 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 3 would thus have a similar, but decreased, significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Less-than-Significant Impact (increased)** – Alternative 1 would result in a less-than-significant impact in 2035 for **TRA-4,** lead to a lack of parking supply, causing significant secondary environmental impacts not already analyzed in this EIR. Alternative 1 would result in increased impacts because it would not include parking related programs that are anticipated to better manage the existing available public parking supply as compared to the proposed Plan. Alternative 1 would thus have a similar, but increased, less-than-significant impact.	**Less-than-Significant Impact (decreased)** – Alternative 2 would result in a less-than-significant impact in 2035 for **TRA-4**. Alternative 2 would result in decreased impacts because it would increase development in areas with multimodal transportation and include increased parking costs that are anticipated to better manage the existing available public parking supply than the proposed Plan. Alternative 2 would thus have a similar, but decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased)** – Alternative 3 would result in a less-than-significant impact in 2035 for **TRA-4**. Alternative 3 would result in decreased impacts because it would increase development in areas with multimodal transportation, increase parking costs, and include free transit, measures which are anticipated to better manage the existing available public parking supply than the proposed Plan. Alternative 3 would thus have a similar, but decreased, less-than-significant impact.
2035	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2030 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be increased compared to the proposed Plan. **Not Cumulatively Considerable (same/increased)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-TRA-1** in 2035 for thresholds TRA-1, TRA-3, and TRA-4. As compared to the proposed Plan, impacts would be the same for TRA-1 and TRA-4 but increased for TRA-4.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2030 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same/decreased)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-TRA-1** in 2035 for thresholds TRA-1, TRA-3, and TRA-4. As compared to the proposed Plan, impacts would be the same for TRA-1 and TRA-4 but decreased for TRA-4.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2030 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same/decreased)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-TRA-1** in 2035 for thresholds TRA-1, TRA-3, and TRA-4. As compared to the proposed Plan, impacts would be the same for TRA-1 and TRA-4 but decreased for TRA-4.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2045	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2045 for **TRA-2**. The SANDAG ABM3 Model does not provide a 2045 scenario. Therefore, this data was interpolated between year 2035 and year 2050 data. Alternative 1 would result in a SB-743 based VMT per capita of 16.41 in 2045 compared to VMT per capita of 15.57 VMT under the proposed Plan in 2045. In addition, Alternative 1 would result in an increase in total VMT of 7,019,463 vehicle miles per day in 2045 compared to Baseline Year 2019 conditions. This increase would be greater than the increase of 4,170,149 miles per day in 2045 under the proposed Plan. Therefore, Alternative 1 would result in greater impacts as it would achieve a smaller VMT reduction than the proposed Plan. This is considered significant since Alternative 1 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 1 would thus have a similar, but increased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2045 for **TRA-2**. The SANDAG ABM3 Model does not provide a 2045 scenario. Therefore, this data was interpolated between year 2035 and year 2050 data. Alternative 2 would result in a SB-743 based VMT per capita of 14.80 in 2045 compared to VMT per capita of 15.57 VMT under the proposed Plan in 2045. In addition, Alternative 2 would result in an increase in total VMT of 1,001,981 vehicle miles per day in 2045 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 4,170,149 miles per day in 2045 under the proposed Plan. Therefore, Alternative 2 would result in decreased impacts as it would achieve a higher VMT reduction than the proposed Plan. This is considered significant since Alternative 2 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2045 for **TRA-2**. The SANDAG ABM3 Model does not provide a 2045 scenario. Therefore, this data was interpolated between year 2035 and year 2050 data. Alternative 3 would result in a SB-743 based VMT per capita of 14.86 in 2045 compared to VMT per capita of 15.57 VMT under the proposed Plan in 2045. In addition, Alternative 3 would result in an increase in total VMT of 1,367,026 vehicle miles per day in 2045 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 4,170,149 miles per day in 2045 under the proposed Plan. Therefore, Alternative 3 would result in decreased impacts as it would achieve a higher VMT reduction than the proposed Plan. This is considered significant since Alternative 3 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 3 would thus have a similar, but decreased, significant impact.
2045	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2045 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be increased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2045 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2045 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan.
2050	**Less-than-Significant Impact (same)** – Alternative 1 would result in less-than-significant impacts in 2050 for **TRA-1** and **TRA-3**. The impact of this alternative is the same as proposed Plan impact because this alternative would be consistent with adopted plans, programs, and design standards. Alternative 1 would thus have similar, less-than-significant impacts.	**Less-than-Significant Impact (same)** – Alternative 2 would result in less-than-significant impacts in 2050 for **TRA-1** and **TRA-3**. The impact of this alternative is the same as proposed Plan impact because this alternative would be consistent with adopted plans, programs, and design standards. Alternative 2 would thus have similar, less-than-significant impacts.	**Less-than-Significant Impact (same)** – Alternative 3 would result in less-than-significant impacts in 2050 for TRA-1 and TRA-3. The impact of this alternative is the same as proposed Plan impact because this alternative would be consistent with adopted plans, programs, and design standards. Alternative 3 would thus have similar, less-than-significant impacts.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Significant Impact (increased)** – Alternative 1 would result in a significant impact in 2050 for **TRA-2**. As shown in Appendix M, Table M-2, Alternative 1 would result in a SB-743 based VMT per capita of 16.33 in 2050 compared to VMT per capita of 15.39 VMT under the proposed Plan in 2050. In addition, Alternative 1 would result in an increase in total VMT of 7,606,674 vehicle miles per day in 2050 compared to Baseline Year 2019 conditions. This increase would be greater than the increase of 4,343,189 miles per day in 2050 under the proposed Plan. Therefore, Alternative 1 would result in greater impacts as it would achieve a smaller VMT reduction than the proposed Plan. This is considered significant since Alternative 1 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 1 would thus have a similar, but increased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact in 2050 for **TRA-2**. As shown in Appendix M, Table M-2, Alternative 2 would result in a SB-743 based VMT per capita of 14.55 in 2050 compared to VMT per capita of 15.39 VMT under the proposed Plan in 2050. In addition, Alternative 2 would result in an increase in total VMT of 959,729 vehicle miles per day in 2050 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 4,343,189 miles per day in 2050 under the proposed Plan. Therefore, Alternative 2 would result in decreased impacts as it would achieve a higher VMT reduction than the proposed Plan. This is considered significant since Alternative 2 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact in 2050 for **TRA-2**. As shown in Appendix M, Table M-2, Alternative 3 would result in a SB-743 based VMT per capita of14.61 in 2050 compared to VMT per capita of 15.39 VMT under the proposed Plan in 2050. In addition, Alternative 3 would result in an increase in total VMT of 1,367,026 vehicle miles per day in 2050 compared to Baseline Year 2019 conditions. This increase would be less than the increase of 4,343,189 miles per day in 2050 under the proposed Plan. Therefore, Alternative 3 would result in decreased impacts as it would achieve a higher VMT reduction than the proposed Plan. This is considered significant since Alternative 3 would not achieve the substantial VMT reductions needed to help achieve statewide GHG reduction goals. Alternative 3 would thus have a similar, but decreased, significant impact.
2050	**Less-than-Significant Impact (increased)** – Alternative 1 would result in a less-than-significant impact in 2050 for **TRA-4**. Alternative 1 would result in increased impacts because it would not include parking related strategies and programs that are anticipated to better manage the existing available public parking supply as compared to the proposed Plan. Alternative 1 would thus have a similar, but increased, less-than-significant impact.	**Less-than-Significant Impact (decreased)** – Alternative 2 would result in a less-than-significant impact in 2050 for **TRA-4**. Alternative 2 would result in decreased impacts because it would increase development in areas with multimodal transportation and include additional parking related programs that are anticipated to better manage the existing available public parking supply as compared to the proposed Plan. Alternative 2 would thus have a similar, but decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased)** – Alternative 3 would result in a less-than-significant impact in 2050 for **TRA-4**. Alternative 3 would result in decreased impacts because it would increase development in areas with multimodal transportation, increase parking costs, and include free transit, measures which are anticipated to manage the existing available public parking supply better than the proposed Plan. Alternative 3 would have a similar, but decreased, less-than-significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Cumulatively Considerable (increased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be increased compared to the proposed Plan. **Not Cumulatively Considerable (same/increased)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-TRA-1** in 2050 for thresholds TRA-1, TRA-3, and TRA-4. As compared to the proposed Plan, impacts would be the same for TRA-1 and TRA-4 but increased for TRA-4.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same/increased)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-TRA-1** in 2050 for thresholds TRA-1, TRA-3, and TRA-4. As compared to the proposed Plan, impacts would be the same for TRA-1 and TRA-4 but increased for TRA-4.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-TRA-1**, a cumulatively considerable contribution to adverse impacts related to transportation. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (same/increased)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-TRA-1** in 2050 for thresholds TRA-1, TRA-3, and TRA-4. As compared to the proposed Plan, impacts would be the same for TRA-1 and TRA-4 but increased for TRA-4.
	Tribal Cultural Resources		
2035	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact on tribal cultural resources in 2035 for **TCR-1**, potential to cause a substantial adverse change in the significance of an adverse change in the significance of a tribal cultural resource. The impact of Alternative 1 in 2035 would be decreased compared to the proposed Plan because development would be more compact, which would result in less ground-disturbing activities that could encounter and adversely affect tribal cultural resources. Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on tribal cultural resources in 2035 for **TCR-1**. The impact of Alternative 2 in 2035 would be decreased compared to the proposed Plan because development would be more compact, which would result in less ground-disturbing activities that could encounter and adversely affect tribal cultural resources. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on tribal cultural resources in 2035 for **TCR-1**. The impact of Alternative 3 in 2035 would be decreased compared to the proposed Plan because development would be more compact, which would result in less ground-disturbing activities that could encounter and adversely affect tribal cultural resources. Alternative 3 would thus have a similar, but decreased, significant impact.
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-TCR-1**, a cumulatively considerable contribution to adverse impacts related to tribal cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-TCR-1**, a cumulatively considerable contribution to adverse impacts related to tribal cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-TCR-1**, a cumulatively considerable contribution to adverse impacts related to tribal cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.
2050	**Significant Impact (decreased)** – Alternative 1 would result in a significant impact on tribal cultural resources in 2050 for **TCR-1** and the impact would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 2 would result in a significant impact on tribal cultural resources in 2050 for **TCR-1** and the impact would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased)** – Alternative 3 would result in a significant impact on tribal cultural resources in 2050 for **TCR-1** and the impact would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 3 would thus have a similar, but decreased, significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-TCR-1**, a cumulatively considerable contribution to adverse impacts related to tribal cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-TCR-1**, a cumulatively considerable contribution to adverse impacts related to tribal cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-TCR-1**, a cumulatively considerable contribution to adverse impacts related to tribal cultural resources. Cumulative impacts would be decreased compared to the proposed Plan.
	Water Supply		
2035	**Less-than-Significant Impact (decreased)** – Alternative 1 would result in a less than significant impact in 2035 for Impact **WS-1,** not have sufficient water supplies available to serve the projected regional demand during normal, dry, and multiple dry years. The impact on regional water demand under Alternative 1 would be less than the proposed Plan because Alternative 1 would result in lower water demand, including less demand for water landscaping, associated with more compact development. Alternative 1 would thus have a similar, but decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased)** – Alternative 2 would result in a less than significant impact in 2035 for Impact **WS-1**. The impact on regional water demand under Alternative 2 would be less than the proposed Plan because Alternative 2 would result in lower water demand, including less demand for water landscaping, associated with more compact development. Alternative 2 would thus have a similar, but decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased)** – Impact **WS-1** would be less than significant in 2035 for Alternative 3. The impact on regional water demand under Alternative 3 would be less than the proposed Plan because this alternative would result in lower water demand, including less demand for water landscaping, associated with more compact development. Alternative 3 would thus have a similar, but decreased, less-than-significant impact.
2035	**Significant Impact (decreased) –** Alternative 1 would result in a significant impact in 2035 for Impact **WS-2**, substantially reduce groundwater supplies, groundwater recharge, or the sustainable management of groundwater basins; and **WS-3**, require or result in the construction of new or expanded water facilities, the construction of which could cause a significant environmental effect**.** The impacts of Alternative 1 would be less than the proposed Plan because Alternative 1 would reduce groundwater demand associated with more compact development and less demand for landscaping watering (**WS-2**). In addition, Alternative 1 would have less demand for new or expanded water facilities because development would occur in developed areas that are already served by existing infrastructure. (**WS-3**). Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased) –** Impact **WS-2** and **WS-3** would be significant for Alternative 2 in 2035. The impacts of Alternative 2 would be less than the proposed Plan because Alternative 2 would reduce groundwater demand associated with more compact development and less demand for landscaping watering (**WS-2**). In addition, Alternative 2 would have less demand for new or expanded water facilities because development would occur in developed areas that are already served by existing infrastructure. (**WS-3**). Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased) –** Impact **WS-2** and **WS-3** would be significant for Alternative 3 in 2035. The impacts of Alternative 3 in 2035 would be less than the proposed Plan because Alternative 3 would result in reduced groundwater demand associated with more compact development and less demand for landscaping watering (**WS-2**). In addition, Alternative 3 would have less demand for new or expanded water facilities because development would occur in developed areas that are already served by existing infrastructure (**WS-3**). Alternative 3 would thus have a similar, but decreased, significant impact.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-WS-1**, a cumulatively considerable contribution to adverse impacts related to water supply. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-WS-1** in 2035 for threshold WS-1.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-WS-1**, a cumulatively considerable contribution to adverse impacts related to water supply. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-WS-1** in 2035 for threshold WS-1.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-WS-1**, a cumulatively considerable contribution to adverse impacts related to water supply. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-WS-1** in 2035 for threshold WS-1.
2050	**Less-than-Significant Impact (decreased)–** Alternative 1 would result in a less-than-significant impact in 2050 for **WS-1** and the impact would be reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 1 would thus have a similar, but decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 2 would result in a less-than-significant impact in 2050 for **WS-1** and the impact would be reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 2 would thus have a similar, but decreased, less-than-significant impact.	**Less-than-Significant Impact (decreased) –** Alternative 3 would result in a less-than-significant impact in 2050 for **WS-1** and the impact would be reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 3 would thus have a similar, but decreased, less-than-significant impact.
2050	**Significant Impact (decreased) –** Impact **WS-2** and **WS-3** would be significant in 2050 under Alternative 1 and reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 1 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased) –** Impact **WS-2** and **WS-3** would be significant in 2050 under Alternative 2 and reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 2 would thus have a similar, but decreased, significant impact.	**Significant Impact (decreased) –** Impact **WS-2** and **WS-3** would be significant in 2050 under Alternative 3 and reduced compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 3 would thus have a similar, but decreased, significant impact.
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-WS-1**, a cumulatively considerable contribution to adverse impacts related to water supply. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar, to the proposed Plan, Alternative 1 would not result in a cumulatively considerable impact for **C-WS-1** in 2050 for threshold WS-1.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-WS-1**, a cumulatively considerable contribution to adverse impacts related to water supply. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar, to the proposed Plan, Alternative 2 would not result in a cumulatively considerable impact for **C-WS-1** in 2050 for threshold WS-1.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-WS-1**, a cumulatively considerable contribution to adverse impacts related to water supply. Cumulative impacts would be decreased compared to the proposed Plan. **Not Cumulatively Considerable (decreased)** - Similar, to the proposed Plan, Alternative 3 would not result in a cumulatively considerable impact for **C-WS-1** in 2050 for threshold WS-1.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
	Wildfire		
2035	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts in 2035 for **WF-1**, increase risk of wildland fire ignition and directly or indirectly expose people or structures to significant risk of loss, injury, or death involving wildland fires; **WF-2,** due to slope, prevailing winds, and other factors, exacerbate wildfire risks, thereby exposing project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire, or exposing people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires; **WF-3**, require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts on the environment; and **WF-4,** expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Alternative 1 would result in decreased wildfire impacts for each of these significance thresholds because this alternative would result in more compact land development than the proposed Plan and therefore more of the regional growth and land use change would be located in dense urban areas outside of the wildland-urban interface. Alternative 1 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 2 would result in significant impacts in 2035 for **WF-1**, **WF-2**, **WF-3**, and **WF-4**. Alternative 2 would result in decreased wildfire impacts for each of these significance thresholds because this alternative would result in more compact land development than the proposed Plan and therefore more of the regional growth and land use change, would be located in dense urban areas outside of the wildland-urban interface. Alternative 2 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 3 would result in significant impacts in 2035 for **WF-1**, **WF-2**, **WF-3**, and **WF-4**. Alternative 3 would result in decreased wildfire impacts for each of these significance thresholds because this alternative would result in more compact land development than the proposed Plan and therefore more of the regional growth and land use change, would be located in dense urban areas outside of the wildland-urban interface. Alternative 3 would thus have similar, but decreased, significant impacts.
2035	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2035 for **C-WF-1**, a cumulatively considerable contribution to adverse impacts related to wildfire. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2035 for **C-WF-1**, a cumulatively considerable contribution to adverse impacts related to wildfire. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2035 for **C-WF-1**, a cumulatively considerable contribution to adverse impacts related to wildfire. Cumulative impacts would be decreased compared to the proposed Plan.

Year	Alternative 1: No Project	Alternative 2: Focused Growth, Higher Parking Pricing, and Arterial and Freeway Speed Reductions	Alternative 3: Focused Growth, Higher Parking and Managed Lane Pricing, and Free Transit
2050	**Significant Impact (decreased)** – Alternative 1 would result in significant impacts in 2050 for **WF-1**, **WF-2**, **WF-3**, and **WF-4** and the impacts would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 1 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 2 would result in significant impacts in 2050 for **WF-1**, **WF-2**, **WF-3**, and **WF-4** and the impacts would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 2 would thus have similar, but decreased, significant impacts.	**Significant Impact (decreased)** – Alternative 3 would result in significant impacts in 2050 for **WF-1**, **WF-2**, **WF-3**, and **WF-4** and the impacts would be decreased compared to the proposed Plan. The rationale described for 2035 applies to 2050. Alternative 3 would thus have similar, but decreased, significant impacts.
2050	**Cumulatively Considerable (decreased)** - Alternative 1 would result in cumulatively considerable impacts in 2050 for **C-WF-1**, a cumulatively considerable contribution to adverse impacts related to wildfire. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 2 would result in cumulatively considerable impacts in 2050 for **C-WF-1**, a cumulatively considerable contribution to adverse impacts related to wildfire. Cumulative impacts would be decreased compared to the proposed Plan.	**Cumulatively Considerable (decreased)** - Alternative 3 would result in cumulatively considerable impacts in 2050 for **C-WF-1**, a cumulatively considerable contribution to adverse impacts related to wildfire. Cumulative impacts would be decreased compared to the proposed Plan.

6 OTHER CONSIDERATIONS REQUIRED BY CEQA

This chapter addresses the following other considerations required by CEQA based on the impact analysis in Chapter 4: growth inducement, maximum theoretical buildout, significant irreversible impacts, and significant and unavoidable impacts.

6.1 GROWTH INDUCEMENT

6.1.1 Background

A project is defined as growth inducing when it: directly or indirectly fosters economic growth, population growth, or additional housing; removes obstacles to growth; or encourages or facilitates other activities that would significantly affect the environment (CEQA Guidelines Section 15126.2). Growth inducement would be caused by the provision or extension of utilities and public services. For example, the development of water, wastewater, fire, or other services in previously underserved areas; the extension of transportation routes into undeveloped areas; and the establishment of major new employment opportunities would all induce growth. The proposed Plan is considered growth-inducing for the reasons presented below. In addition, Section 4.14, Population and Housing, under Impact POP-1, further analyzes whether implementation of the proposed Plan would induce substantial unplanned population growth to areas of the region either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., by extending roads and other infrastructure).

6.1.2 Economic Growth, Population Growth, Additional Housing

As shown in Table 2-1, in Section 2.0, "Project Description," of this Draft EIR, from 2022 to 2035, the region is forecasted have an increase of 117,056 people (4%), 137,242 housing units (11%), and 67,297 jobs (4%). From 2036 to 2050, the region is forecasted to decrease by 4,112 people (-0.1%), increase by 65,577 housing units (4.8%), and increase by 103,460 jobs (6.2%). The proposed Plan's objectives include focusing population and employment growth in existing urbanized areas to protect sensitive habitat and natural resource areas, and providing transportation investments that support compact land development patterns. The proposed Plan focuses this population, housing units, and employment growth near existing and planned transportation infrastructure and in areas with existing utilities and municipal or public services. This growth pattern would preserve natural resources, open space, and agricultural lands.

Development to accommodate regional growth and land use change would be constructed throughout the region. However, the proposed Plan forecasts a general intensification of existing land uses in urban communities and along key transportation corridors. Most of these areas have established roadways and utilities, as well as water and sewer services. The placement of additional housing units in established areas would require upgrading and resizing of existing infrastructure, including water facilities. The upgrading of these facilities would further remove obstacles to the construction of additional housing within and adjacent to these areas. Chapter 2, Project Description, and Section 4.14, Population and Housing, further describe forecasted population, housing units, and job growth within the region.

The planned transportation network improvements of the proposed Plan are intended to expand upon the current transportation network by providing transportation investments that support compact land development patterns and decrease sprawl while reducing greenhouse gas (GHG) emissions and other environmental impacts. These transportation network improvements would remove obstacles to growth in some areas of the region, which would support additional housing, population, and economic growth. Section 4.14, Population and Housing, discusses forecasted regional population and employment growth associated with the proposed Plan.

6.2 MAXIMUM THEORETICAL BUILDOUT SCENARIO

6.2.1 Background

The theoretical buildout scenario assumes maximum development allowed under the proposed Plan, pursuant to the maximum density and/or intensity specified in the adopted land use elements of local general plans (100 percent of allowable residential units and 100 percent of allowable non-residential square footage). Due to regulatory constraints, physical constraints, and foreseeable market conditions, realization of this scenario is not reasonably foreseeable and is highly unlikely; however, this EIR includes an analysis of this scenario for informational purposes because the jurisdictional land use plans associated with the proposed Plan land use forecast do provide the theoretical capacity for residential units and nonresidential building square footage up to this maximum. Table 6-1 compares 2050 housing units and jobs under the 2050 forecast of the proposed Plan with the maximum theoretical buildout scenario.

Table 6-1 Existing and Forecasted Job Growth by Jurisdiction

2050 Forecast	Proposed Plan	Maximum Theoretical Buildout	Percent increase relative to the Proposed Plan
Housing Units	1,438,461	1,690,069	17.5%
Jobs	2,373,052	2,738,653	15.4%

Source: SANDAG 2025. Maximum Theoretical Buildout Scenario.

The maximum theoretical buildout scenario would represent a change in the level of residential and nonresidential development in the region. By 2050, it would result in approximately 251,608 additional housing units (approximately 17.5 percent more than the proposed Plan forecast) and approximately 365,601 additional jobs (approximately 15.4 percent more than the proposed Plan forecast) relative to forecasted growth under the proposed Plan. There would be no changes to the planned transportation network improvements and programs of the proposed Plan under this scenario.

The capacity of the maximum theoretical buildout scenario for housing units was estimated by either analyzing maximum plan density based on local adopted general plans (as of 2022) and any additional unit capacity from accessory dwelling units, or from Regional Housing Needs Allocation. The proposed Plan's Sustainable Communities Strategy (SCS) land use pattern is in alignment with each jurisdiction's adopted general plan. Given the generalized, highly theoretical nature of this buildout analysis, the analysis does not account for additional regulations, site specific conditions, or other factors that would hinder attainment of maximum allowable density or intensity on any given parcel. For example, parking requirements, slope and other land suitability characteristics, and implementation of environmental regulations would make attainment of maximum densities and/or intensities infeasible, and site-specific easements would restrict development of certain properties to levels below what is permitted by adopted plans. Another variable is that decision makers in each jurisdiction have the authority to approve, deny, or modify discretionary land use projects based on numerous site-specific factors.

The maximum theoretical buildout scenario assumes that development of lands with specified developmental constraints would be excluded, included but not limited to steep slopes (i.e., greater than 25 percent), Federal Emergency Management Agency (FEMA) 100-year floodplains and floodways, and conserved and preserved lands.

6.2.2 Aesthetics and Visual Resources

Under the maximum theoretical buildout scenario, neighborhoods that are below maximum buildout would be subject to redevelopment to achieve buildout, and areas that are not forecasted for development under the proposed Plan would be developed to the maximum density or intensity. As such, the character and the aesthetic quality of many areas would be altered. New development and infrastructure would be established within and adjacent to scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings. Scenic vistas, as well as scenic resources within a State-designated scenic highway, would be altered, if not blocked

completely in some areas, based on the construction of new buildings resulting from forecasted regional growth and land use change. Impacts would be greater with implementation of the maximum theoretical buildout scenario than with the proposed Plan. The greater amount of development under the theoretical buildout scenario would also substantially degrade the character of areas of the region, including adding a visual element of urban character to an existing rural or open space area. In addition, new development would create new light sources at night that would adversely affect dark skies in some locations. As with the proposed Plan, impacts on aesthetic resources would be reduced with the mitigation measures identified in Section 4.1, Aesthetics and Visual Resources, but would remain significant and unavoidable.

6.2.3 Agriculture and Forestry Resources

Impacts on agricultural lands, including areas with existing agricultural uses or lands with Williamson Act contracts, would be greater under the maximum theoretical buildout scenario. Lands with existing low-density residential uses that encourage or sustain agricultural operations would be developed to achieve maximum buildout and would no longer support agricultural operations. Additionally, a greater number of lands used for agricultural operations would be impacted by encroaching residential or commercial development. Areas adjacent to lands zoned for agricultural uses would be developed to achieve maximum density in such a way as to cause land use conflicts, as the nonagricultural uses would be in proximity to odors, runoff, and other effects. Impacts on agricultural lands would be greater than with implementation of the proposed Plan and greater than existing conditions.

Under the maximum theoretical buildout scenario, lands with existing low-density residential uses that include forest lands would be developed to achieve maximum buildout, and the theoretical buildout scenario would decrease acreage of forest lands in the region. As with the proposed Plan, impacts on agriculture and forestry resources would be reduced with the mitigation measures identified in Section 4.2, Agriculture and Forestry Resources, but would remain significant and unavoidable.

6.2.4 Air Quality

Under maximum theoretical buildout conditions, regional growth and land use change would result in some increases in air pollutant emissions, but as with the proposed Plan, conflicts with applicable Air Quality Attainment Plans are unlikely.

Compared to the proposed Plan, maximum theoretical buildout would result in increased particulate emissions, both construction and operational. Therefore, maximum theoretical buildout would have greater potential to violate or contribute substantially to a violation of an air quality standard. In particular, emissions of respirable particulate matter (PM10,associated with maximum theoretical buildout scenario have greater potential to result in violations of California Ambient Air Quality Standards for this pollutant, or to contribute substantially to existing violations. The proposed Plan results in cumulatively considerable increases in emissions of the nonattainment pollutant PM10, a significant impact. Maximum theoretical buildout would increase the magnitude of this impact.

The proposed Plan's PM2.5 and toxic air contaminant (TAC) emissions would expose sensitive receptors to substantial pollutant concentrations, a significant impact. Emissions of PM2.5 and TACs under the maximum theoretical buildout scenario would increase due to increases in vehicle miles traveled (VMT). Compared to the proposed Plan, there would be increased exposure of sensitive receptors to substantial pollutant concentrations. As with the proposed Plan, significant air quality impacts would be reduced with the mitigation measures identified in Section 4.3, Air Quality, but would remain significant and unavoidable.

6.2.5 Biological Resources

Impacts on biological resources would be greater under the maximum theoretical buildout scenario when compared to the proposed Plan. Under this scenario, areas that are vacant and not preserved or protected, or areas of low density would be developed to allow higher density and higher intensity uses. The conversion of

undeveloped lands to developed lands would result in impacts on biological resources, affecting sensitive natural communities and potential regulated waters; special status plant and wildlife species, and regional wildlife corridors and movement. Mitigation measures to reduce these impacts are described in Section 4.4, Biological Resources, for the proposed Plan. However, those impacts would remain significant and unavoidable. The same mitigation measures would apply for the theoretical buildout scenario. The maximum theoretical buildout scenario would consist of more development than the proposed Plan, and although impacts on biological resources would be reduced with the mitigation identified in Section 4.4, they would remain significant and unavoidable.

The maximum theoretical buildout scenario would not conflict with approved local, regional, State, and federal regulations, policies, ordinances, and finalized Habitat Conservation Plans/Natural Community Conservation Plans (HCP/NCCPs). The maximum theoretical buildout scenario would result in less-than-significant impacts related to encroachment into hardline preserve areas identified by adopted HCP/NCCPs because, as with the proposed Plan, development projects would require biologically equivalent or superior compensation of habitat or project redesign when there is encroachment into hardline preserve areas. Therefore, that impact would be less than significant.

6.2.6 Cultural Resources

Regional growth and land use changes forecasted under the maximum theoretical buildout scenario would result in ground disturbance that would occur during redevelopment and development of most of the region, including areas that are not planned for development under the proposed Plan. The area of ground disturbance would be greater than that anticipated under the proposed Plan, as areas not planned for regional growth and land use changes under the proposed Plan would be developed to their maximum densities. Development under the proposed Plan is more concentrated than it would be under maximum theoretical buildout. The likelihood of encountering historical resources or unique archeological resources is greatest on sites that have been minimally excavated in the past (e.g., undeveloped parcels, vacant lots, and lots containing surface parking, etc.). Previously excavated areas are generally considered to have a low potential for historic resources or unique archaeological resources, as the soil containing such resources has been removed. However, projects under the maximum theoretical buildout scenario likely would involve underground parking areas, underground tanks, new pipelines, or replacement of pipelines, all at a lower depth than the previous development in previously graded areas, and in areas that were not previously developed. As such, additional significant ground disturbances are anticipated, and it is possible that more unique archeological resources would be disturbed.

Therefore, compared to the proposed Plan, a greater number of historical resources or unique archeological resources would experience substantial adverse changes; this impact would continue to be significant. As with the proposed Plan, under maximum theoretical buildout, impacts related to disturbance of human remains would continue to be less than significant due to compliance with existing laws and regulations. Section 4.5, Cultural Resources identifies mitigation measures that would reduce impacts on historical resources or unique archaeological resources. However, as with the proposed Plan, under maximum theoretical buildout these impacts would remain significant and unavoidable.

6.2.7 Energy

Under maximum theoretical buildout conditions, regional growth and land use change would increase overall energy consumption compared to the proposed Plan. Increased housing would result in additional construction-related energy consumption from the use of fuel for off-road equipment, worker commutes, and electricity consumption. Operational electricity consumption and natural gas use would also increase under maximum theoretical buildout conditions. However, Impact EN-1 is based on the per capita energy consumption, which would determine whether the energy use under maximum theoretical buildout conditions is more efficient than under the existing land uses and transportation network. As discussed in Section 4.6, Energy, the per capita energy consumption rates for the proposed Plan decrease by 12.6% from 2022 to 2035, 11.8 % from 2022 to 2050, and 0.8% from 2036 to 2050, respectively. Therefore, even with the somewhat increased energy consumption under

maximum theoretical buildout conditions, population levels would be higher, and the per capita rates would continue to be lower than existing conditions. This impact would be less than significant.

Federal, State, and regional agencies will continue to implement programs that improve energy efficiency, decrease reliance on fossil fuels, and increase reliance on renewable energy sources. SANDAG efforts will continue to support State goals through 2050. SANDAG and San Diego Gas & Electric (SDG&E) will continue to make efforts at the regional and local levels to increase the amount of renewable energy to meet energy demands. As with the proposed Plan, the maximum theoretical buildout conditions would not result in an increased reliance on fossil fuels and decreased reliance on renewable energy sources, and there would be no conflict with a State or regional plan related to the increased use of renewable energy or energy efficiency. The impact would be less than significant.

6.2.8 Geology, Soils, and Paleontological Resources

Regional growth and land use changes in the buildout forecasted in the maximum theoretical scenario would result in additional structures exposed to seismic hazards such as ground shaking, fault rupture, liquefaction, and earthquake-induced landslides; however, new buildings and utilities would be constructed according to existing State and local regulations to minimize geologic hazards. As with the proposed Plan, adherence to the laws, regulations, and programs included in Section 4.7.2 and project-specific investigations following State and local standards and practices would minimize risks to people or property as a result of the maximum theoretical buildout scenario. Therefore, impacts associated with geologic and seismic risks would be less than significant for the maximum theoretical buildout scenario, such as with the proposed Plan. Further, incorporated cities and county government within the region have safety elements as part of their general plans, which contain requirements concerning the risks associated with expansive soils, landslides, subsidence, liquefaction, and other seismic and geologic hazards, as summarized in Table 4.7-3 in Section 4.7, 'Geology, Soils, and Paleontological Resources'. Impacts related to unstable soils, including expansive, collapsible, or unstable soils; landslides; and erosion or loss of topsoil would be greater under the maximum theoretical buildout scenario, as a result of the construction associated with development to accommodate regional growth and land use changes located in erosion-prone areas . Impacts would be greater than those under the proposed Plan, as a greater number of development projects would be constructed. As described in Section 4.7, Geology, Soils, and Paleontological Resources, adherence to the California Building Code (CBC), coastal zone regulations, construction general permit requirements, and local grading and erosion control ordinances would reduce the potential for substantial soil erosion or loss of topsoil, and impacts would continue to be less than significant.

The maximum theoretical buildout scenario would result in more construction than under the proposed Plan, particularly development in areas within geologic formations of moderate to high paleontological resource potential and areas containing unique geologic resources, and disturbance would occur at a lower depth than the previous development in previously graded areas, which would increase potential impacts on paleontological resources and unique geological features. Compared to the proposed Plan, this increased development under maximum theoretical buildout would cause a greater number of unique paleontological resources and unique geological features to be destroyed; this impact would continue to be significant and unavoidable.

6.2.9 Greenhouse Gas Emissions

Compared to existing conditions, the proposed Plan's GHG emissions would decrease for all horizon years (2035 and 2050). Under maximum theoretical buildout conditions, regional growth and land use change would result in some increases in GHG emissions, but there would still be net decreases compared to existing conditions.

Development under the maximum theoretical buildout scenario would be expected to largely continue in a similar pattern as under the proposed Plan, which encourages compact development, supporting rather than impeding adopted Climate Cation Plans (CAPs), GHG reduction plans, and/or sustainability plans relevant to the proposed Plan.

Under maximum theoretical buildout, development would be expected to largely continue in a similar pattern as under the proposed Plan, which encourages compact development, although per capita GHG emissions from passenger vehicles would somewhat increase. This increase could create a conflict with Senate Bill (SB) 375's per capita GHG emission reduction targets set by the California Air Resources Board for the San Diego region. The proposed Plan would be inconsistent with the State's ability to achieve the 2030 and 2045 reference points of 15.6 and 3.9 million metric tons of carbon dioxide equivalent, respectively (based on the goals of SB 32 and Assembly Bill [AB] 1279). Though a reference point could not be determined for 2050, as no statewide reduction target has been codified for that year, the proposed Plan's emissions would be greater in 2050 than the reference point derived for the AB 1279 target. Because GHG emissions would be higher under maximum theoretical buildout, these inconsistencies, which are a significant impact, would be worse. As with the proposed Plan, this would be reduced with the mitigation identified in Section 4.8, Greenhouse Gas Emissions, but impacts would remain significant and unavoidable.

6.2.10 Hazards and Hazardous Materials

The increased construction that would occur under the maximum theoretical buildout scenario would lead to an increase in the risk of hazards to the public, schools, and/or the environment through the routine use, handling, transport, or disposal of hazardous materials. As with the proposed Plan, adherence to existing regulations discussed in Section 4.9.2 would result in less-than-significant impacts related to hazardous emissions or handling hazardous materials during preconstruction, demolition, and/or construction activities for the theoretical buildout scenario. Regional growth and land use changes under the maximum theoretical buildout scenario would, similar to the proposed Plan, also result in air traffic hazards for people residing or working within an airport land use plan or within 2 miles of a public airport or public use airport. However, existing regulations, Federal Aviation Administration (FAA) procedures, Airport Land Use Compatibility Plans (ALUCPs), and Air Installation Compatible Use Zone (AICUZ) studies ensure compatibility between uses and reduce the potential for aircraft accidents and would result in a less-than-significant impact.

Additionally, regional growth and land use changes would result in development of parcels that are not proposed under the proposed Plan, and redevelopment would occur at higher densities, which would cause obstruction for emergency response vehicles or result in activities that would cause physical interference in the implementation of emergency response and evacuation plans or interfere with adequate emergency access. Associated development projects under the theoretical buildout scenario would be required to comply with existing regulations to reduce such hazards, as described in Section 4.9, Hazards and Hazardous Materials. However, as with the proposed Plan, under maximum theoretical buildout these impacts would remain significant and unavoidable.

6.2.11 Hydrology and Water Quality

The maximum theoretical buildout scenario would result in development and redevelopment throughout the region, at a greater level than under the proposed Plan. New areas of impermeable surface would be created as vacant or undisturbed areas would be paved; there would be changes in absorption rates, drainage patterns, groundwater infiltration, or the rate of surface runoff; and water and groundwater quality would be diminished. Because new construction and development would be required to comply with federal, State, and local regulations governing water quality and pollution prevention, as described in Section 4.10, Hydrology and Water Quality, as with the proposed Plan, these hydrology and water quality impacts associated with maximum theoretical buildout would be less than significant.

Development projects associated with the proposed Plan would be evaluated for the potential for damage from flooding and other associated hazards. Existing planning and design standards and regulations, such as project-specific technical studies, existing and updated emergency evacuation plans, water tank safety requirements, and other similar and applicable safety design considerations, would serve to address and minimize these potential impacts. Although a greater number of projects would be constructed under the maximum theoretical buildout scenario, and therefore a greater number of projects would be at risk from flooding, seiche, tsunami, or mudflow,

existing standards and regulations would continue to apply. Therefore, these impacts associated with hydrology and water quality would also be considered less than significant under the maximum theoretical buildout scenario.

6.2.12 Land Use and Planning

Under the maximum theoretical buildout scenario, there would be more regional growth and land use change than under the proposed Plan. Under the proposed Plan, regional growth and land use change would not physically divide an established community or cause significant impacts (not evaluated elsewhere in the EIR) due to conflicts with land use plans, and these impacts would be less than significant. Given the limited amount of additional development, regional growth and land use change impacts would continue to be less than significant under maximum theoretical buildout conditions. However, transportation network improvement land use and planning impacts relating to physical division of an established community would continue to be significant and unavoidable as with the proposed Plan.

Like the proposed Plan, because the maximum theoretical build out scenario assumes maximum development allowed under the proposed Plan, it would not conflict with land use plans, policies and regulations, including general plans, specific plans, and community plans adopted for the purpose of avoiding or mitigating an environmental effect.

6.2.13 Mineral Resources

Under the maximum theoretical buildout scenario, additional vacant or undeveloped land in areas with known mineral resources or locally important resource recovery sites would be developed, restricting the ability to extract mineral resources in those areas. As with the proposed Plan, impacts on the availability of known mineral resources or locally important resource recovery sites would be reduced with the mitigation identified in 4.12, Mineral Resources, but would remain significant and unavoidable.

6.2.14 Noise and Vibration

The maximum theoretical buildout scenario would result in more regional growth and land use change than associated with the proposed Plan. The increased development density would increase the number of persons exposed to noise levels exceeding State and local noise standards. This increase in development would also generate noise levels that would increase ambient noise levels, and further expose noise-sensitive receptors to substantial temporary and permanent increases in ambient noise levels from construction and operation. The increased level of residential and nonresidential development under the maximum theoretical buildout scenario would result in an increase of new residents, visitors, and workers in the region compared to the proposed Plan, which would thereby increase vehicle trips on area roadways, increasing traffic noise levels. Increased construction and transportation trips under the maximum buildout scenario would increase vibration and groundborne noise generated in proximity to sensitive receptors. As with the proposed Plan, impacts would be reduced with the mitigation identified in Section 4.13, Noise and Vibration, but would remain significant and unavoidable.

Compliance with local jurisdiction general plans and FAA standards would reduce noise from airstrips and ensure land use compatibility with any new development, including additional development under the maximum theoretical buildout scenario. As such, impacts would remain less than significant under the maximum theoretical buildout scenario.

6.2.15 Population and Housing

To achieve the maximum theoretical buildout scenario, an increase in the overall level of housing and nonresidential development would occur region-wide. This would induce additional unplanned growth in some areas of the San Diego Region beyond the unplanned growth anticipated with the proposed Plan. Greater levels

of development and conversion to higher densities would also lead to displacement of residents and housing units, and potentially necessitate the construction of replacement housing, as older existing residential units are replaced. As with the proposed Plan, some impacts would be reduced with the mitigation identified in Section 4.14, Population and Housing, but would remain significant and unavoidable.

6.2.16 Public Services and Utilities

Maximum theoretical buildout would lead to increased regional growth and land use change within the region. This growth would require an increase of public services and recreational facilities, such as fire and police protection, schools, and libraries. This growth would also increase demands on governmental facilities, recreational facilities, wastewater collection and treatment facilities, stormwater drainage facilities, electric power, natural gas, telecommunications, and/or solid waste facilities, which would in turn necessitate the construction of additional or improved public facilities to maintain service ratios, and/or other performance standards. As with the proposed Plan, impacts on public services would be reduced with the mitigation identified in Section 4.15, Public Services and Utilities, but would remain significant and unavoidable.

Additionally, with increased regional growth and land use changes, there would be more demand for utilities such as wastewater treatment facilities, stormwater drainage facilities, electric power, natural gas, telecommunication facilities, and/or solid waste disposal facilities under the maximum theoretical buildout scenario. The construction of new or expanded utility facilities would cause significant environmental impacts in order to maintain service levels, such as facility capacity. As with the proposed Plan, impacts on utilities would be reduced with the mitigation identified in Section 4.15 but would remain significant and unavoidable.

6.2.17 Transportation

The maximum theoretical buildout scenario would increase demand on transportation systems compared to the proposed Plan. The proposed Plan would decrease VMT per capita below Base Year (2022) conditions, but not to the levels needed to achieve State GHG reduction targets. Due to the increased regional growth and land use change under maximum theoretical buildout, this scenario, notwithstanding higher population numbers, would likely not decrease VMT per capita further beyond what is anticipated under the proposed Plan and would increase total VMT compared to the proposed Plan. Impacts under the maximum theoretical buildout scenario, as with the proposed Plan, would be significant and unavoidable, even after the mitigation measures described in Section 4.16, Transportation, are applied.

As with the proposed Plan, implementation of regional growth and land use changes under maximum theoretical buildout would not induce substantial vehicle travel because transportation network improvements would be the same. Maximum theoretical buildout would also cause a greater percentage of peak period transit and walk/bike trips to work, a greater percentage of jobs within proximity to high frequency transit stops and bike facilities, and substantially more daily transit boardings. The percentage of population within 0.5 mile of a transit stop and average peak period travel time to work on transit would increase under the maximum theoretical buildout, but the performance of public transit, bicycle, or pedestrian facilities would not decrease. As such, the characteristics of the maximum theoretical build out, as with the proposed Plan, are generally consistent with applicable plans and policies and would not conflict with them.

Implementation of the proposed Plan would not change applicable design standards and transportation network improvements would be designed consistent with those standards. Likewise, the maximum theoretical buildout is not expected to change applicable design standards either and would be consistent with applicable standards.

Finally, as with the proposed Plan, the maximum theoretical buildout scenario would not lead to a lack of parking supply that would cause significant secondary environmental impacts not already accounted for.

6.2.18 Tribal Cultural Resources

Regional growth and land use changes forecasted under the maximum theoretical buildout scenario would result in ground disturbance that would occur during redevelopment and development of most of the region, including areas that are not planned for development under the proposed Plan. The area of ground disturbance would be greater than that anticipated under the proposed Plan, as areas not planned for regional growth and land use changes under the proposed Plan would be developed to their maximum densities. Development under the proposed Plan is more concentrated than it would be under maximum theoretical buildout. The likelihood of encountering tribal cultural resources is greatest on sites that have been minimally excavated in the past (e.g., undeveloped parcels, vacant lots, and lots containing surface parking, etc.). Projects under the maximum theoretical buildout scenario could involve underground parking areas, underground tanks, new pipelines, or replacement of pipelines, all at a lower depth than the previous development in previously graded areas, and in areas that were not previously developed. As such, additional significant ground disturbances are anticipated, and it is possible that more tribal cultural resources would be disturbed.

Therefore, compared to the proposed Plan, a greater number of tribal cultural resources would experience substantial adverse changes; this impact would continue to be significant. Section 4.17, Tribal Cultural Resources, identifies mitigation measures that would reduce impacts on tribal cultural resources. However, as with the proposed Plan, under maximum theoretical buildout these impacts would remain significant and unavoidable.

6.2.19 Water Supply

The maximum theoretical buildout scenario would increase water demand compared to the proposed Plan. A greater amount of water would be needed for the construction and operation of residential and nonresidential development, developed park space, and other necessary developments to accommodate this regional growth. The increased growth under the maximum theoretical buildout scenario would lead to increased water demands such that water supplies would be inadequate to serve these demands, and new or expanded water supplies or entitlements would be required. In addition, continued growth under the maximum theoretical buildout scenario would further impede groundwater basin sustainability. As with the proposed Plan, this water supply impact would be reduced with the mitigation identified in Section 4.18, Water Supply, but would remain significant and unavoidable.

Under the proposed Plan, regional growth and land use change would result in the construction of additional new water facilities or the expansion of existing facilities to adequately meet forecasted demand or capacity needs, the construction of which would cause significant environmental effects. Increased water demands under maximum theoretical buildout would accelerate the need for new or expanded water facilities. As with the proposed Plan, this impact would be reduced with the mitigation identified in Section 4.18 but would remain significant and unavoidable.

6.2.20 Wildfire

Given the relatively large amount of area within the San Diego region considered at high risk for wildland fires, additional regional growth and land use change under the maximum theoretical buildout scenario would expose additional people and structures to a significant risk of loss, injury, or death involving wildland fires. Adherence to the regulations described in Section 4.19.2 would reduce impacts associated with wildland fires to a degree but not to a level less than significant. Also, as with the proposed Plan, impacts would be reduced with the mitigation identified in Section 4.19, Wildfire, but the following significant and unavoidable impacts would remain: increased exposure of people and structures to risk of loss, injury, or death involving wildland fires; exposing project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire; installation of infrastructure that may exacerbate fire risk; and exposing people or structures to significant risks as a result of runoff, post-fire slope instability, or drainage changes.

6.3 SIGNIFICANT IRREVERSIBLE IMPACTS

Implementation of the proposed Plan would result in permanent changes to the existing environments, which have been described throughout this EIR. While the proposed Plan focuses population and employment growth in existing urban areas while also providing transportation investments that support compact land development patterns and reduce sprawl, there will still be some conversions of undeveloped land to urbanized uses. These conversions are considered a permanent irreversible change and would occur directly through construction of development on undeveloped land. Land use changes and transportation network improvements would result in significant irreversible impacts on aesthetics and visual resources, including changes to existing community character and views. Future development projects associated with the proposed Plan would result in a direct irreversible loss of sensitive vegetation communities that supports rare, threatened, or endangered species, and impacts on these resources would be significant and irreversible. The development of currently undeveloped land and other land use changes would result in significant irreversible impacts on agricultural resources and forest lands, and the availability of known mineral resources. The proposed Plan would substantially induce irreversible population growth and increased density, which would displace existing housing units, and result in additional people that would be susceptible to noise impacts. As development occurs at urban edges, additional people and structures would be at risk from wildland fires.

The proposed Plan's regional growth and land use changes would result in the irreversible consumption of nonrenewable resources. This use will have an incremental and irreversible effect on such resources. The irreversible commitment of limited resources is inherent in any development project or, in the case of the proposed Plan, aggregated development projects. Resources anticipated to be irreversibly committed over the timespan of the proposed Plan include, but are not limited to, lumber and other related forest products; sand, gravel, and concrete; petrochemicals; construction materials; steel, copper, lead, and other metals; and water. Development associated with the proposed Plan represents a long-term commitment to the consumption of fossil fuel oil and natural gas. These increased energy demands relate to construction, lighting, heating, and cooling of residences and buildings, as well as construction and operation of transit systems.

6.4 SIGNIFICANT AND UNAVOIDABLE IMPACTS

Based on the analysis detailed in Chapter 4 of this EIR, implementation of the proposed Plan would result in significant and unavoidable impacts for the resource topics shown in Table 6-2. As required by CEQA Guidelines Section 15126.1(c), significant and unavoidable impacts listed in this table are described in further detail in the relevant sections of Chapter 4. Table 6-2 identifies significant and unavoidable impacts for each horizon year (2035 and 2050).

With respect to land use changes implemented by local jurisdictions and transportation network improvements implemented by other transportation project sponsors, SANDAG has no authority to require implementing agencies to implement or enforce project-specific mitigation measures. In addition, some programmatic mitigation may not be feasible or effective for particular projects based on project or site-specific circumstances. This results in many significant impacts being significant and unavoidable.

In each resource area section, this EIR identifies mitigation measures that generally are performance standards-based, which SANDAG shall and other implementing agencies "can and should" comply with in mitigating project-specific impacts. Where applicable, SANDAG then identifies examples of project-level mitigation measures that may be required by lead agencies, to meet performance standards. Lead agencies may also identify other comparable measures capable of reducing impacts below the specified threshold. SANDAG cannot require other lead agencies to adopt mitigation, and it is ultimately the responsibility of the lead agency to determine and adopt project specific mitigation as appropriate and feasible for each individual project. As a result, this EIR concludes significant and unavoidable for many impacts where SANDAG does not have authority to implement or enforce project-specific mitigation measures, or where State action might be needed reduce impacts to less-than-significant levels.

Table 6-2 Significant and Unavoidable Impacts

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
4.1 Aesthetics and Visual Resources			
AES-1 Have a substantial adverse effect on a scenic vista Significant impact in 2035 and 2050	**AES-1a Protect Public Views of Scenic Vistas for Transportation Network Improvements** **AES-1b Protect Public Views of Scenic Vistas for Development Projects**	Significant and Unavoidable	Significant and Unavoidable
AES-2 Substantially damage scenic resources, including, but not limited to, trees, rocks, outcroppings, and historic structures within a state scenic highway or local scenic route Significant impact in 2035 and 2050	**AES-2a Reduce Impacts on Scenic Resources in a State Scenic Highway and Local Scenic Routes for Transportation Network Improvements** **AES-2b Reduce Impacts on Scenic Routes in a State Scenic Highway and Local Scenic Routes for Development Projects**	Significant and Unavoidable	Significant and Unavoidable
AES-3 Substantially degrade the existing visual character or quality of public views of the site and its surroundings, including adding a visual element of urban character to an existing rural or open space area, or conflicting with regulations governing scenic quality Significant impact in 2035 and 2050	**AES-1a Protect Public Views of Scenic Vistas for Transportation Network Improvements** **AES-2a Reduce Impacts on Scenic Resources in a State Scenic Highway and Local Scenic Routes for Transportation Network Improvements** **AES-2b Reduce Impacts on Scenic Resources in a State Scenic Highway and Local Scenic Routes for Development Projects** **AES-3a Reduce Impacts on Visual Character for Transportation Network Improvements** **AES-3b Reduce Impacts on Visual Character for Development Projects**	Significant and Unavoidable	Significant and Unavoidable
AES-4 Substantially degrade the existing visual character or quality of public views of the site and its surroundings by creating a new source of light or glare that would adversely affect day or nighttime views Significant impact in 2035 and 2050	**AES-4a Minimize Effects of Light and Glare for Transportation Network Improvements** **AES-4b Minimize Effects of Light and Glare for Development Projects** **BIO-2a: Implement Design, Minimization, and Avoidance Measures for Special-Status Animal Species**	Significant and Unavoidable	Significant and Unavoidable
C-AES-1 Make a cumulatively considerable contribution to adverse effects related to aesthetics and visual resources Cumulatively considerable in 2035 and 2050	**AES-1a Protect Public Views of Scenic Vistas for Transportation Network Improvements** **AES-1b Protect Public Views of Scenic Vistas for Development Projects** **AES-2a Reduce Impacts on Scenic Resources in a State Scenic Highway and Local Scenic Routes for Transportation Routes Improvements** **AES-2b Reduce Impacts on Scenic Routes in a State Scenic Highway and Local Scenic Routes for Development Projects** **AES-3a Reduce Impacts on Visual Character for Transportation Network Improvements** **AES-3b Reduce Impacts on Visual Character for Development Projects**	Cumulatively Considerable	Cumulatively Considerable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
	AES-4a Minimize Effects of Light and Glare for Transportation Network Improvements **AES-4b Minimize Effects of Light and Glare for Development Projects** **BIO-2a: Implement Design, Minimization, and Avoidance Measures for Special-Status Animal Species**		
4.2 Agriculture and Forestry Resources			
AG-1 Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, or other agricultural lands to nonagricultural use Significant impact in 2035 and 2050	**AG-1a Preserve Existing Agricultural Lands** **AG-1b Reduce Transportation Network Improvement and Development Conflicts with Agricultural Operations**	Significant and Unavoidable	Significant and Unavoidable
AG-2 Conflict with existing zoning for agricultural use or a Williamson Act contract Significant impact in 2035 and 2050	**AG-1a Preserve Existing Agricultural Lands** **AG-1b Reduce Transportation Network Improvement and Development Conflicts with Agricultural Operations**	Significant and Unavoidable	Significant and Unavoidable
FR-1 Convert or result in the loss of "Forest Land" as defined in the California Forest Legacy Act of 2007 (PRC Section 12220[G]) Significant impact in 2035 and 2050	**FR-1 Reduce Impacts on Forest Lands** **BIO-1a Implement Design, Minimization, and Avoidance Measures for Sensitive Natural Communities and Regulated Aquatic Resources** **BIO-1b Provide Compensatory Mitigation** **BIO-1e Implement Best Management Practices to Avoid Indirect Impacts**	Significant and Unavoidable	Significant and Unavoidable
C-AG-1 Make a cumulatively considerable contribution to adverse effects on agriculture and forestry resources Cumulatively considerable in 2035 and 2050	**AG-1a Preserve Existing Agricultural Lands** **AG-1b Reduce Transportation Network Improvement and Development Conflicts with Agricultural Operations** **FR-1 Reduce Impacts on Forest Lands** **BIO-1a Implement Design, Minimization, and Avoidance Measures for Sensitive Natural Communities and Regulated Aquatic Resources** **BIO-1b Provide Compensatory Mitigation** **BIO-1e Implement Best Management Practices to Avoid Indirect Impacts**	Cumulatively Considerable	Cumulatively Considerable
4.3 Air Quality			
AQ-2 Result in an operations-related cumulatively considerable net increase in nonattainment or attainment criteria pollutants, including VOC, NOx, PM10, PM2.5, and SOx Significant impact in 2035 and 2050	**AQ-2a Secure Incentive Funding** **AQ-2b Regional Plan VMT Credit/Banking Program** **GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans**	Significant and Unavoidable	Significant and Unavoidable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
	GHG-4c Allocate Funding for Zero-Emission Vehicle Infrastructure **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects** **TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects**		
AQ-3 Result in construction-related emissions above regional mass emission thresholds Significant impact in 2035 and 2050	**AQ-3a Implement Construction Best Management Practices for Fugitive Dust** **AQ-3b Reduce Diesel Emissions During Construction from Off-Road Equipment** **AQ-3c Reduce Diesel Emissions During Construction from On-Road Vehicles** **GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans** **GHG-4c Allocate Funding for Zero-Emission Vehicle Infrastructure** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects**	Significant and Unavoidable	Significant and Unavoidable
AQ-4 Expose sensitive receptors to substantial PM10 and PM2.5 concentrations Significant impact in 2035 and 2050	**AQ-2a Secure Incentive Funding** **AQ-2b Regional Plan VMT Credit/Banking Program** **AQ-4 Reduce Exposure to Localized Particulate and/or TAC Emissions** **GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans** **GHG-4c Allocate Funding for Zero-Emission Vehicle Infrastructure** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects** **TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects**	Significant and Unavoidable	Significant and Unavoidable
AQ-5 Expose sensitive receptors to substantial TAC concentrations Significant impact in 2035 and 2050	**AQ-2a Secure Incentive Funding** **AQ-2b Regional Plan VMT Credit/Banking Program** **AQ-4 Reduce Exposure to Localized Particulate and/or TAC Emissions** **AQ-5a Reduce Exposure to Localized Toxic Air Contaminant Emissions**	Significant and Unavoidable	Significant and Unavoidable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
	AQ-5b Reduce Exposure to Localized Toxic Air Contaminant Emissions during Railway Design **GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans GHG-4c Allocate Funding for Zero-Emission Vehicle Infrastructure** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4c Establish Funding Programs for Zero-Emission Vehicle Infrastructure** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects** **TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects**		
C-AQ-1 Make a cumulatively considerable contribution to adverse effects related to air quality Cumulatively considerable in 2035 and 2050	**AQ-2a Secure Incentive Funding** **AQ-2b Regional Plan VMT Credit/Banking Program** **AQ-3a Implement Construction Best Management Practices for Fugitive Dust** **AQ-3b Reduce Diesel Emissions During Construction from Off-Road Equipment** **AQ-3c Reduce Diesel Emissions from On-Road Vehicles** **AQ-4 Reduce Exposure to Localized Particulate and/or TAC Emissions** **AQ-5a Reduce Exposure to Localized Toxic Air Contaminant Emissions** **AQ-5b Reduce Exposure to Localized Toxic Air Contaminant Emissions during Railway Design** **GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans** **GHG-4c Allocate Funding for Zero-Emission Vehicle Infrastructure** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects** **TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects**	Cumulatively Considerable	Cumulatively Considerable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
4.4 Biological Resources			
BIO-1 Have a substantial adverse effect on any sensitive natural communities identified in local or regional plans, policies, regulations, or by CDFW or USFWS; or have a substantial adverse effect on state or federally regulated waters and wetlands through direct removal, filling, hydrological interruption, or other means Significant impact in 2035 and 2050	**BIO-1a Implement Design, Minimization, and Avoidance Measures for Sensitive Natural Vegetation Communities and Regulated Aquatic Resources** **BIO-1b Provide Compensatory Mitigation** **BIO-1c Prepare a Habitat Restoration Plan** **BIO-1d Prepare Habitat/Long-Term Management Plans** **BIO-1e Implement Best Management Practices to Avoid Indirect Impacts**	Significant and Unavoidable	Significant and Unavoidable
BIO-2 Have a substantial adverse effect, either directly or indirectly, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or listed by CDFW or USFWS, including their federally designated critical habitat, or species that are considered sensitive in CEQA Guidelines Section 15380 Significant impact in 2035 and 2050	**BIO-1a Implement Design, Minimization, and Avoidance Measures for Sensitive Natural Vegetation Communities and Regulated Aquatic Resources** **BIO-1b Provide Compensatory Mitigation** **BIO-1c Prepare a Habitat Restoration Plan** **BIO-1d Prepare Habitat / Long-Term Management Plans** **BIO-2a Implement Design, Minimization, and Avoidance Measures for Special-Status Animal Species** **BIO-2b Provide Compensatory Mitigation for Special-Status Plant Species** **BIO-2c Provide Compensatory Mitigation for Special-Status Animal Species**	Significant and Unavoidable	Significant and Unavoidable
BIO-3 Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites Significant impact in 2035 and 2050	**BIO-3a Facilitate Wildlife Movement**	Significant and Unavoidable	Significant and Unavoidable
C-BIO-1 Make a cumulatively considerable contribution to adverse effects on biological resources Cumulatively considerable in 2035 and 2050	**BIO-1a Implement Design, Minimization, and Avoidance Measures for Sensitive Natural Vegetation Communities and Regulated Aquatic Resources** **BIO-1b Provide Compensatory Mitigation** **BIO-1c Prepare a Habitat Restoration Plan** **BIO-1d Prepare Habitat / Long-Term Management Plans** **BIO-1e Implement Best Management Practices to Avoid Indirect Impacts** **BIO-2a Implement Design, Minimization, and Avoidance Measures for Special Status Animal Species** **BIO-2b Provide Compensatory Mitigation for Special-Status Plant Species** **BIO-2c Provide Compensatory Mitigation for Special-Status Animal Species** **BIO-3a Facilitate Wildlife Movement**	Cumulatively Considerable	Cumulatively Considerable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
4.5 Cultural Resources			
CULT-1 Cause a substantial adverse change in the significance of a historical resource or unique archaeological resource Significant impact in 2035 and 2050	**CULT-1a Develop Project-Level Measures for Development Projects and Transportation Network Improvements** **CULT-1b Implement Monitoring and Data Recovery Programs for Development Projects and Transportation Network Improvements**	Significant and Unavoidable	Significant and Unavoidable
C-CULT-1 Make a cumulatively considerable contribution to adverse effects on cultural resources Cumulatively considerable in 2035 and 2050	**CULT-1a Develop Project-Level Measures for Development Projects and Transportation Network Improvements** **CULT-1b Implement Monitoring and Data Recovery Programs for Development Projects and Transportation Network Improvements**	Cumulatively Considerable	Cumulatively Considerable
4.6 Energy			
Not applicable		Not applicable	Not applicable
4.7 Geology, Soils, and Paleontological Resources			
GEO-5 Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature Significant impact in 2035 and 2050	**GEO-5a Identify the Potential for Unique Paleontological Resources or Unique Geologic Features for Development Projects or Transportation Network Improvements** **GEO-5b Impacts on Unique Paleontological Resources or Unique Geologic Features for Development Projects or Transportation Network Improvements**	Significant and Unavoidable	Significant and Unavoidable
C-PALEO-1 Make a cumulative considerable contribution to adverse effects on paleontological resources Cumulatively considerable in 2035 and 2050	**GEO-5a Identify the Potential for Unique Paleontological Resources or Unique Geologic Features for Development Projects or Transportation Network Improvements** **GEO-5b Impacts on Unique Paleontological Resources or Unique Geologic Features for Development Projects or Transportation Network Improvements**	Cumulatively Considerable	Cumulatively Considerable
4.8 Greenhouse Gas Emissions			
GHG-4 Be inconsistent with the state's ability to achieve the 2030 reduction target of SB 32 and 2045 reduction goal of AB 1279 Significant impact in 2030, 2045, and 2050	**GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans** **GHG-4c Allocate Funding for Zero-Emission Vehicle Infrastructure** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects.** **AQ-3b Reduce Diesel Emissions During Construction From Off-Road Equipment** **AQ-3c Reduce Diesel Emissions During Construction From On-Road Vehicles**	Significant and Unavoidable (Year 2030)	Significant and Unavoidable (Years 2045 and 2050)

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
	TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects **WS-1a Implement Water Conservation Measures for Transportation Network Improvements** **WS-1b Implement Water Conservation Measures for Development Projects**		
C-GHG-1 Make a cumulative considerable contribution to adverse effects to GHG emissions Cumulatively considerable in 2030, 2035, 2045, and 2050	**GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans** **GHG-4c Allocate Funding for Zero-Emission Vehicle Infrastructure** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects** **AQ-3b Reduce Diesel Emissions During Construction From Off-Road Equipment** **AQ-3c Reduce Diesel Emissions During Construction From On-Road Vehicles.** **TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects** **WS-1a Implement Water Conservation Measures for Transportation Network Improvements** **WS-1b Implement Water Conservation Measures for Development Projects**	Cumulatively Considerable	Cumulatively Considerable
4.9 Hazards and Hazardous Materials			
HAZ-4 Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan or result in inadequate emergency access Significant impact in 2035 and 2050	**HAZ-4: Demonstrate Consistency with Adopted Emergency Response or Evacuation Plans or Emergency Access**	Significant and Unavoidable	Significant and Unavoidable
C-HAZ-1 Make a cumulatively considerable contribution to adverse effects related to emergency response and evacuation plans and emergency access Cumulatively considerable in 2035 and 2050	**HAZ-4: Demonstrate Consistency with Adopted Emergency Response or Evacuation Plans or Emergency Access**	Cumulatively Considerable	Cumulatively Considerable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
4.10 Hydrology and Water Quality			
Not applicable	Not applicable	Not applicable	Not applicable
4.11 Land Use			
LU-1 Physically divide an established community Significant impact in 2050	**LU-1a Provide Access and Connections for Transportation Network Improvements**	Less than Significant	Significant and Unavoidable
C-LU-1 Make a cumulatively considerable contribution to adverse impacts related to land use and planning Cumulatively considerable in 2050	**LU-1a Provide Access and Connections for Transportation Network Improvements**	Not Cumulatively Considerable	Cumulatively Considerable
4.12 Mineral Resources			
MR-1 Result in the loss of availability of known aggregate and mineral resources supply sites that would be of value to the region and the residents of the state, or result in the loss of availability of a locally-important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan Significant impact in 2035 and 2050	**MR-1a Conserve Aggregate and Mineral Resources During Planning and Design of Development Projects** **MR-1b Conserve Aggregate and Mineral Resources During Planning and Design of Transportation Network Improvements**	Significant and Unavoidable	Significant and Unavoidable
C-MR-1 Make a cumulatively considerable contribution to adverse effects related to mineral resources Cumulatively considerable in 2035 and 2050	**MR-1a Conserve Aggregate and Mineral Resources During Planning and Design of Development Projects** **MR-1b Conserve Aggregate and Mineral Resources During Planning and Design of Transportation Network Improvements**	Cumulatively Considerable	Cumulatively Considerable
4.13 Noise and Vibration			
NOI-1 Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies; or generate a substantial absolute increase in ambient noise Significant impact in 2035 and 2050	**NOI-1a Implement Construction Noise Reduction Measures for Development Projects and Transportation Network Improvements** **NOI-1b Implement Operational Noise Reduction Measures for Transportation Network Improvements** **NOI-1c Implement Operational Noise Reduction Measures for Development Projects**	Significant and Unavoidable	Significant and Unavoidable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
NOI-2 Generation of excessive groundborne vibration or groundborne noise levels Significant impact in 2035 and 2050	**NOI-2a Implement Construction Groundborne Vibration and Noise Reduction Measures** **NOI-2b Implement Groundborne Vibration and Noise Reduction Measures for Rail Operations**	Significant and Unavoidable	Significant and Unavoidable
C-NOI-1 Make a cumulatively considerable contribution to adverse effects related to noise and vibration Cumulatively considerable in 2035 and 2050	**NOI-1a Implement Construction Noise Reduction Measures for Development Projects and Transportation Network Improvements** **NOI-1b Implement Operational Noise Reduction Measures for Transportation Network Improvements** **NOI-1c Implement Operational Noise Reduction Measures for Development Projects** **NOI-2a Implement Construction Groundborne Vibration and Noise Reduction Measures** **NOI-2b Implement Groundborne Vibration and Noise-Reduction Measures for Rail Operations**	Cumulatively Considerable	Cumulatively Considerable
4.14 Population and Housing			
POP-1 Induce substantial unplanned population growth to areas of the region either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., by extending roads and other infrastructure) Significant impact in 2035 and 2050	**POP-1a Coordinate with Local Jurisdictions to Reduce Substantial Unplanned Population Growth**	Significant and Unavoidable	Significant and Unavoidable
POP-2 Displace substantial numbers of people or housing units, which would necessitate the construction of replacement housing elsewhere Significant impact in 2035 and 2050	**POP-2a Design Development Projects to Reduce Displacement** **POP-2b Design Transportation Network Improvement Projects to Reduce Displacement**	Significant and Unavoidable	Significant and Unavoidable
C-POP-1 Make a cumulatively considerable contribution to adverse effects related to population and housing Cumulatively considerable in 2035 and 2050	**POP-1a Coordinate with Local Jurisdictions to Reduce Substantial Unplanned Population Growth** **POP-2a Design Development Projects to Reduce Displacement** **POP-2b Design Transportation Network Improvement Projects to Reduce Displacement**	Cumulatively Considerable	Cumulatively Considerable
4.15 Public Services, Recreation, and Utilities			
PS-1 Result in substantial adverse physical impacts associated with the provision of or need for new or physically altered (i.e., expanded) public facilities, in order to maintain adequate fire and police protection,	**PS-1 Implement Mitigation Measures for New/Expanded Public Service Facilities**	Significant and Unavoidable	Significant and Unavoidable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
emergency services, schools, libraries, and recreation facilities Significant impact in 2035 and 2050			
REC-1 Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated Significant impact in 2035 and 2050	**REC-1 Implement Mitigation Measures for Parks and Other Recreational Facilities**	Significant and Unavoidable	Significant and Unavoidable
U-1 Result in the expansion, relocation, or construction of wastewater collection and treatment, stormwater drainage, electric power, natural gas, or telecommunications facilities to adequately meet projected capacity needs, the construction of which could cause significant environmental impacts Significant impact in 2035 and 2050	**U-1a Implement Mitigation Measures for New/Expanded Wastewater, Stormwater, Electrical, Natural Gas, and Telecommunications Facilities Associated with Development Projects** **U-1b Implement Mitigation Measures for New/Expanded Stormwater Facilities Associated with Transportation Network Improvements**	Significant and Unavoidable	Significant and Unavoidable
U-2 Generate solid waste in excess of state or local standards or in excess of the capacity of local infrastructure; impair the attainment of solid waste reduction goals; or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste Significant impact in 2035 and 2050	**U-2a Implement Mitigation Measures for New/Expanded Solid Waste Facilities** **U-2b Reduce Construction Waste** **U-2c Reduce Operational Waste**	Significant and Unavoidable	Significant and Unavoidable
C-PS-1 Make a cumulatively considerable contribution to adverse effects related to public services Cumulatively considerable in 2035 and 2050	**PS-1 Implement Mitigation Measures for New/Expanded Public Service Facilities**	Cumulatively Considerable	Cumulatively Considerable
C-U-1 Make a cumulatively considerable contribution to adverse effects related to utilities Cumulatively considerable in 2035 and 2050	**U-1a Implement Mitigation Measures for New/Expanded Wastewater, Stormwater, Electrical, Natural Gas, and Telecommunications Facilities Associated with Development Projects** **U-1b Implement Mitigation Measures for New/Expanded Stormwater Facilities Associated with Transportation Network Improvements** **U-2a Implement Mitigation Measures for New/Expanded Solid Waste Facilities** **U-2b Reduce Construction Waste** **U-2c Reduce Operational Waste**	Cumulatively Considerable	Cumulatively Considerable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
C-REC-1 Make a cumulatively considerable contribution to adverse effects related to recreational resources Cumulatively considerable in 2035 and 2050	**REC-1 Implement Mitigation Measures for Parks and Other Recreational Facilities**	Cumulatively Considerable	Cumulatively Considerable
4.16 Transportation			
TRA-2 Conflict or be inconsistent with CEQA Guidelines Section 15064.3 by not achieving the substantial VMT reductions needed to help achieve statewide GHG reduction goals Significant impact in 2030, 2035, 2045, and 2050	**TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects** **AQ-2b Regional Plan VMT Credit/Banking Program** **GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects**	Significant and Unavoidable (2030 and 2035)	Significant and Unavoidable (2045 and 2050)
C-TRA-1 Make a cumulatively considerable contribution to adverse effects to transportation Cumulatively considerable in 2030, 2035, 2045,and 2050	**TRA-2 Achieve Further VMT Reductions for Transportation and Development Projects** **AQ-2b Regional Plan VMT Credit/Banking Program** **GHG-4a Allocate Grant Funding to Projects that Reduce GHG Emissions** **GHG-4b Coordination and Support to SANDAG Member Agencies to Adopt, Update, and Monitor GHG Reduction Plans** **GHG-4d Implement Measures to Reduce GHG Emissions from Transportation Projects** **GHG-4e Implement Measures to Reduce GHG Emissions from Development Projects**	Cumulatively Considerable (2030 and 2035)	Cumulatively Considerable (2045 and 2050)
4.17 Tribal Cultural Resources			
TCR-1 Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is either (1) listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k); or (2) determined by the lead agency, in its discretion and supported by	**TCR-1a Implement Tribal Cultural Resources Mitigation Measures for Development Projects and Transportation Network Improvements** **TCR-1b Implement Monitoring and Mitigation Programs for Development Projects and Transportation Network Improvements**	Significant and Unavoidable	Significant and Unavoidable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1 Significant impact in 2035 and 2050			
C-TCR-1 Make a cumulatively considerable contribution to adverse effects on tribal cultural resources Cumulatively considerable in 2035 and 2050	**TCR-1a Implement Tribal Cultural Resources Mitigation Measures for Development Projects and Transportation Network Improvements** **TCR-1b Implement Monitoring and Mitigation Programs for Development Projects and Transportation Network Improvements**	Cumulatively Considerable	Cumulatively Considerable
4.18 Water Supply			
WS-1 Not have sufficient water supplies available to serve the projected regional demand during normal, dry and multiple dry years Significant impact in 2050	**WS-1a Implement Water Conservation Measures for Transportation Network Improvements** **WS-1b Implement Water Conservation Measures for Development Projects** **WS-1c Ensure Adequate Water Supply for Development Projects**	Not applicable	Significant and Unavoidable
WS-2 Substantially decrease groundwater supplies, or interfere substantially with groundwater recharge such that the proposed Plan would impede sustainable management of groundwater basins or obstruct implementation of a sustainable groundwater management plan Significant impact in 2035 and 2050.	**WS-1a Implement Water Conservation Measures for Transportation Network Improvements** **WS-1b Implement Water Conservation Measures for Development Projects** **WS-2 Implement Groundwater Measures to Ensure Sustainable Yield for Development Projects**	Significant and Unavoidable	Significant and Unavoidable
WS-3 Require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects Significant impact in 2035 and 2050	**WS-1a Implement Water Conservation Measures for Transportation Network Improvements** **WS-1b Implement Water Conservation Measures for Development Projects** **WS-2 Implement Groundwater Measures to Ensure Sustainable Yield for Development Projects** **WS-3 Implement Measures for New or Expanded Water Facilities**	Significant and Unavoidable	Significant and Unavoidable
C-WS-1 Make a cumulatively considerable contribution to adverse effects to water supply Cumulatively considerable impact in 2035 and 2050	**WS-1a Implement Water Conservation Measures for Transportation Network Improvements** **WS-1b Implement Water Conservation Measures for Development Projects** **WS-1c Ensure Adequate Water Supply for Development Projects** **WS-2 Implement Groundwater Measures to Ensure Sustainable Yield for Development Projects** **WS-3 Implement Measures for New or Expanded Water Facilities**	Cumulatively Considerable	Cumulatively Considerable

Impacts of the Proposed Plan in 2035 and 2050	Mitigation Measures	Level of Significance After Mitigation	
		2035	2050
4.19 Wildfire			
WF-1 Increase risk of wildland fire ignition and directly or indirectly expose people or structures to significant risk of loss, injury, or death involving wildland fires Significant impact in 2035 and 2050	**WF-1 Reduce Wildfire Risk for Development and Transportation Projects**	Significant and Unavoidable	Significant and Unavoidable
WF-2 Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire Significant impact in 2035 and 2050	**WF-1 Reduce Wildfire Risk for Development and Transportation Projects**	Significant and Unavoidable	Significant and Unavoidable
WF-3 Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment. Significant impact in 2035 and 2050	**WF-1 Reduce Wildfire Risk for Development and Transportation Projects** **WF-3 Reduce Wildfire Risk Related to New or Expanded Infrastructure Required to Support Regional Growth and Land Use Development**	Significant and Unavoidable	Significant and Unavoidable
WF-4 Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes Significant impact in 2035 and 2050	**WF-4 Reduce Post-Fire Risks Related to Flooding, Landslides, Slope Instability, or Drainage Changes for Development and Transportation Projects**	Significant and Unavoidable	Significant and Unavoidable
C-WF-1 Make a cumulatively considerable contribution to adverse effects related to wildfire Cumulatively considerable in 2035 and 2050	**WF-1 Reduce Wildfire Risk for Development and Transportation Projects** **WF-3 Reduce Wildfire Risk Related to New or Expanded Infrastructure Required to Support Regional Growth and Land Use Development** **WF-4 Reduce Post-Fire Risks Related to Flooding, Landslides, Slope Instability, or Drainage Changes for Development and Transportation Projects**	Cumulatively Considerable	Cumulatively Considerable

8 PREPARERS OF THE ENVIRONMENTAL DOCUMENT

SANDAG (Lead Agency)

Kirsten Uchitel ..... Project Manager
Samantha Foulke ..... Senior Legal Counsel
Blake Anderson ..... Associate GIS Analyst
Cundo Arellano ..... Senior Researcher & Modeler
Adam Attar ..... Senior GIS Analyst
Anna Bettis ..... Senior Regional Planner
Bryce Burdge ..... Associate Data Scientist
Jeffrey Chu ..... Data Scientist II
Grace Chung ..... Senior Researcher and Modeler
Natasha Dulik ..... Associate Regional Planner
Mike Duncan ..... Principal Program Management Analyst
Samaya Elder ..... Associate Regional Planner
Susan Freedman ..... Regional Planning Program Manager
Andrew Gordon ..... Manager of Regional Information Services
Rachel Graffeo ..... Associate Graphic Designer
Keith Greer ..... Deputy Director, Environmental Compliance and Climate
Dante Lee ..... Senior Researcher and Modeler
Antoinette Meier ..... Senior Director of Regional Planning
Ziying Ouyang ..... Manager of Regional Models
Bhargava Sana ..... Manager of Regional Models
Gregor Schroeder ..... Manager of Regional Models
Kim Smith ..... Senior Regional Planner
Jeff Yen ..... Associate Data Scientist

Ascent, Inc. (CEQA Compliance)

Poonam Boparai ..... Project Director/Principal-in-Charge
Kathie Washington ..... Project Manager
Claudia Watts ..... Deputy Project Manager/Senior Planner
Mike Parker ..... Senior Advisor/QA/QC
Chad Beckstrom ..... Senior Reviewer
Sydney Coatsworth ..... Senior Reviewer
Yingying Cai ..... Environmental Planner
Tristan Evert ..... Environmental Planner
Nicole Greenfield ..... Environmental Planner
Kathy Tang ..... Environmental Planner
Bryn Kirk ..... Environmental Planner
Marlie Long ..... Environmental Planner
Elena Savignano ..... Environmental Planner/Transportation and Noise Specialist
Jazmin Amini ..... Environmental Planner/Transportation and Noise Specialist
Matthew McFalls ..... Air Quality and Health Risk Lead
Julia Wilson ..... Greenhouse Gas Emissions and Energy Lead
Honey Walters ..... Senior Advisor for Air Quality, Greenhouse Gas Emissions, and Energy
Matt Brehmer ..... Air Quality and Greenhouse Gas Emissions Specialist
Brenda Hom ..... Senior Greenhouse Gas Emissions Specialist
Hannah Kornfield ..... Senior Greenhouse Gas Emissions Specialist
Claire Moss ..... Climate Change Specialist

Adam Qian ..... Climate Change Specialist
Erik de Kok ..... Senior Advisor for Climate Change
Kelley Kelso ..... Hydrology/Water Quality Specialist
Alta Cunningham ..... Cultural Resources Specialist
Dimitri Antoniou ..... Senior Noise Specialist
Peter Hoholick ..... Noise Specialist
Scott Gressard ..... Senior Biological Resources Specialist
Cindy Li ..... Biological Resources Specialist
Phi V. Ngo ..... Lead GIS Specialist
Alyssa Luna ..... GIS Specialist
Brian Perry ..... Graphics Specialist
Gretel Hakanson ..... Technical Editor
Michele Mattei ..... Publishing Specialist
Gayiety Lane ..... Publishing Specialist
Riley Smith ..... Publishing Specialist
Tracy Prybyla ..... Publishing Specialist
Kassandra Beltran ..... Publishing Specialist

BlueScape Environmental (Air Quality and Health Risk)

James Westbook ..... Principal
Francisco Matamala ..... Senior Engineer II
Laura Fulton ..... Senior Engineer II
Melissa Westbook ..... Senior Project Scientist
Peyton Willson ..... Project Scientist

CirclePoint (CEQA)

Audrey Zagazeta ..... President & CEO
Marco Mendoza ..... Project Manager
Matthew Moore ..... Project Manager
Justine Garner ..... Senior Associate Planner
Krysten McCue ..... Senior Associate Planner
Cristina Lefemine ..... Associate Planner
Derek Hick ..... Associate Planner
Eric Xia ..... Assistant Planner

Schaefer Ecological Services (Biological Resources)

Christina Schaefer ..... Biological Resources Specialist

Bargas Consulting (Cultural Resources, Paleontological Resources, Tribal Cultural Resources)

Courtney Richards ..... Director of Paleontological Resources
Ronit Zavodivker ..... Paleontologist
Ashley Hallock ..... Principal Archaeologist
Giorgia Fiorentino ..... Archaeologist

Intersecting Metrics (Transportation)

Stephen Cook ..... Principal
Dale Aquino ..... Senior Transportation Engineer
